The extract shows the temper in which Grote began his enquiries, and we could wish that Mrs. Grote had reprinted the whole Chapter xxi. of the *Personal Life*, in the introduction to this edition. He took with him some letters of introduction to a few eminent Swissers, "persons of importance," says Mrs. Grote, "in Aargau and Appenzell, but advisedly refused those offered to him addressed to leaders of either party." She sets down the names of six persons with whom he "had the advantage of conversing whilst in Switzerland." It should be said here that by far the best known of these, the historian and statistician Gerold Meyer-von-Knonau, of Zürich, the famous son of a famous father, will scarcely be recognised under the name given him by Mrs. Grote as "M. Meyer of Gronau." His family name has not merely been misspelt, but has been mistaken for the name of his dwelling-place. The successive letters despatched from Switzerland by Mr. Grote were printed in the *Spectator*, and on his return to England in the autumn he published the whole series as a volume.

These letters have of course no permanent value as a contribution to the history of the Sonderbund. They no doubt helped at the time of their appearance, beyond anything else written in our language, to set the faces of our countrymen the right way in relation to the Swiss struggle: they were at once accepted by all discerning Englishmen, in spite of the advocacy of the cause of the Sonderbund in the *Times*, as the fullest and clearest exposition of the historical causes which brought about, and the principles which lay beneath, the civil war within the Swiss Confederacy. Dr. Kasimir Pfyffer has shown that on the part of the Bund it was a war for existence, and for liberation from external foreign interference. Mr. Grote shows in his last letter how clearly he forecast that these were the results secured by the defeat of the Sonderbund. The account of the Swiss conflict in the *Annual Register* for 1847 is compiled from Grote's letters, and in many places in his own words. It is hardly possible to doubt that the letters had their effect upon the course of English diplomacy. The diplomatic aspect of the Swiss civil war, so far as concerns England, has lately been set in a clear light by Mr. Ashley's biography of Lord Palmerston, and every patriotic Switzer will recognise the straightforward

common sense, as well as the zeal for the freedom and nationality of the Confederation, with which the English minister then acted. Mrs. Grote tells us that Prince Albert, in a conversation with Lord Palmerston at Windsor, asked whether he had read Grote's little book. Palmerston replied that he had not seen it. "Then," said the Prince, "you cannot be qualified to enter fairly upon the discussion of the affairs of Switzerland: pray go and study it directly." The historian was "no great admirer generally of Lord Palmerston," as he afterwards told M. de Tocqueville; but he spoke with unusual approbation of his conduct in the affairs of both Italy and Switzerland during the year 1847. The letters show how clearly Mr. Grote perceived the suicidal tendency of Guizot's diplomacy. The minister of Louis Philippe knew that interference in Switzerland was a French tradition. But this tradition was Bourbonist, Republican, and Bonapartist. In the seventeenth century, the thoroughly German republicans of Solothurn, enriched by the residence of the Bourbon king's ambassador among them, and denationalised by French gold, could hold high civic festival upon the birthday of a French dauphin, as if he were virtually their own future monarch; in the eighteenth century, the French Republic could obliterate all the cantons at a stroke, melting them down into the one and indivisible Helvetic Republic; in the nineteenth century, the First Consul of France could again set them up, and dictate in Paris the terms of the famous Act of Mediation (die *Vermittlungsurkunde*) for the Confederation and for the individual Cantons. But this bad tradition should not have been maintained by the constitutional King of the French. Guizot did not perceive that the cause represented by the Bund against the refractory Cantons was substantially one and the same as the cause of his master. The Liberal renaissance in Europe, or reaction against the Holy Alliance and the Jesuits, to which Louis Philippe owed his throne, was astir and at work in Switzerland before it showed its strength so openly in France by the Revolution of July. The Sonderbund, or armed league of the seven Roman Catholic Cantons—or rather of the then Conservative majority in those Cantons—was the first serious and resolute attempt to check the new Liberal and Constitutional movement throughout Europe. The Syllabus lay in germ in the camp of the Sonderbund; and the two successive new Constitutions of the Swiss Confederacy, the *Bunderverfassung* of 1848, and the still more pronounced realisation of "the modern State," or *Kulturstaat*, in the *Bunderverfassung* of 1874, with their noble results and their nobler promise, lay in germ in the camp of the Bund. This fact is now accepted as a truism by the heirs of the two parties in the conflict of 1847; one tracing back all good, and the other all evil, to the defeat of the Sonderbund.

Mr. Grote's keen perception was not led astray by the apparent anomaly that the purely democratic Cantons were fighting on the side of the Sonderbund, and that the Conservatives and Jesuits in Switzerland were raising the cry of Cantonal liberty, independence, and self-government.

He could see that they were not advocates for the liberty, independence, and self-government of the whole national Confederation. They hoped for the intervention of Austria, or for the intervention of France, just as their heirs in our day hoped that Marshal MacMahon would interfere in Geneva and the Bernese Jura, and terrify the Swiss into restoring Bishop Mermillod and the recusant clergy. He could see that the religious movement had been stirred up, and was being employed, for ends purely political; he saw that the quarrel was not between Protestantism and Catholicism, or between belief and infidelity, but between the old and the new conceptions of political society; hence he was able to connect together the religious excitement of the Protestant Conservatives of Zürich against Dr. Strauss, and the religious excitement of the Catholic Conservatives of Luzern in favour of the re-introduction of the Jesuits. A common terror and a common despair at the "Zeitgeist" made Protestants and Jesuits one party. Mr. Grote perceived that the men of the old aristocratic Cantons, the descendants of the "Lords of Zürich" and the "Lords of Bern," were fighting to maintain the authority of the Swiss National Bund against the separating Sonderbund, and that the pure Democrats of Uri and Schwyz were the real representatives of that Liberal and National cause to which his sympathies perforce gravitated. Mr. Grote constantly speaks of such persons as "Radicals;" and I see that the summarist in Lesur's *Annuaire Historique pour 1847*—a true representative of French official prejudice—calls the Army of the National Bund "les forces radicales," whereas he names Herr Sahr-Soglio's forces "l'armée du Sonderbund." The designation of parties in a particular time or nation ought not to be translated by a paraphrase which a foreign politician holds to be synonymous. The men who opposed the Sonderbund called themselves at that time "Liberals" and "freisinnig," as their followers still do. This designation is always used by Kasimir Pfyffer in his autobiographical recollections. "Radicals" was the term given to them by the Jesuits, and was taken to be reproachful, whereas Mr. Grote no doubt thought it glorious.

Many memoirs and autobiographies of active partisans of each side in the Swiss conflict have been published during the interval between the issue of the first and the last edition of Grote's letters. Two of the most completely representative men of the Sonderbund period, both of them active statesmen and officials of that Canton which was the centre and spirit of the separatist league, and both of them also holding office in the Bund—Dr. Kasimir Pfyffer, the historian of Luzern and the foremost champion of the Liberals, and Ritter Bernhard von Meyer, the soul of the Sonderbund—have died quite recently, and within a few months of one another. Grote has occasion to mention each of them. He speaks of Dr. Pfyffer once, and incidentally, as a most able Swiss jurist. Pfyffer was in exile in Baden while Grote was in Switzerland. The name of Meyer occurs continually in nearly every letter. There was something significant in the last days and the burial of the two rivals. The funeral of Dr. Pfyffer

was a kind of national solemnity; Meyer was buried in a foreign land, not as a Swiss republican, but as an Austrian nobleman, to which dignity the Emperor had raised him on account of his services to his new fatherland. Both these men have left important memoirs. Dr. Pfyffer's *Erinnerungen aus meinem Leben* appeared during his life-time: the first volume of the *Erlebnisse der Bernhard Ritter v. Meyer, weiland Staatsschreiber und Tagsatzungs-gesandter des Cantons Luzern*, was published last year in Vienna. The book gives a more pleasing impression of the man himself than the English reader will derive from Grote's letters, while it justifies the view taken by Grote of Meyer's political activity. It shows us a thoroughly honourable man, but one who was as thoroughly party-spirited, and incapable of apprehending national and cantonal questions apart from the narrow standpoint of his own pious subjectivity. It was his boast in his adopted land that the Concordat between Austria and the Pope was substantially his own work.

Mrs. Grote is mistaken if she supposes, as she certainly leads us to infer in her preface, that "the Vatican, sustained by the free application of its vast revenues," had any direct hand in the formation or the maintenance of the Sonderbund. Luquet, the Bishop of Hesebon, who was the Pope's Ambassador Extraordinary and Apostolical Legate in Switzerland at that period, was a fair representative of the earlier political attitude of his master. When Pius IX. passed over decisively to the camp of the Conservatives, Bishop Luquet fell into disfavour, and he published a justificatory memoir upon the affairs of Switzerland, which throws a good deal of light upon the relation of the Pope to the Sonderbund. It is plain that the Jesuits and the Vatican were not at that time (as Mrs. Grote supposes, but as her husband nowhere indicates) two names for one power. Their final relation to each other was still uncertain. The Pope was undecided: his agents reflected his own view: the Papal Nuncios at Paris and Luzern had spoken against the introduction of the Jesuits into Luzern as "a danger" and "the beginning of an endless evil." The Pope addressed a letter to the Swiss by Luquet in which he urged them to come to terms. The allies of the Jesuits thereupon accused the Pope of disheartening the Catholics, and forsaking his obligations as the shepherd of the flock. "They treated me," says the Nuntio, "as if I were a Freemason." They even compelled him to suppress the Papal brief, and to substitute for it a prayer that heavenly help might descend upon the Sonderbund party. The Jesuits were determined upon war. But the Pope, by his delegate, stood upon the position which he condemned later in § 80 of the Syllabus:—

"Our Conservatives," said a priest to Luquet, "need to be led back to the true principles of our religion; they have no sense of the duty of behaviour toward the supreme high priest of our religion; many of them are saying that they begin to doubt whether the present Pope is to be considered *als den wahren Stellvertreter Jesu Christi*, whether he is not rather to be held *als den Helden und das Werkzeug des Radicalismus*, and

capable of sacrificing the interests of the Church and Religion."

No words could show more plainly that Jesuitism and Roman Catholicism were, at that period, two distinct forces in Catholic Switzerland, as they had been ever since the day, so graphically described by Dr. Pfyffer, when the commissary of the Bishop of Constanze and the Schultheiss and Rath of Luzern took from the Jesuit fathers the keys of their college and their church, and told them that the Pope had dissolved their order, and that the State of Luzern heartily approved the act. THOMAS HANCOCK.

The Crimea and Transcaucasia; being the Narrative of a Journey in the Kouban, in Gouria, Georgia, Armenia, Ossety, Imeritia, Swannety, and Mingrelia, and in the Tauric Range. By Commander J. Buchan Telfer, R.N., F.R.G.S. With two Maps and numerous Illustrations. (London: Henry S. King & Co., 1876.)

THE country lying between the Black Sea and the Caspian has still much interest for us in various ways. Bisected by the great range of the Caucasus, it may be roughly regarded as consisting of Circassia to the north and Georgia to the south, both of which are countries presenting grand and beautiful features, and peopled by vigorous and picturesque races, which afford a pleasing relief to the somewhat too dead level of ordinary civilised life. Under Russian rule these countries are rapidly changing and losing much of what has been most peculiar and attractive about them. A railway has been running some time from Poti, on the eastern shore of the Black Sea, to Tiflis, the capital of Georgia; it has plenty of refreshment-rooms; in Tiflis itself we may put up at the Hôtel Caucasus, or the Hôtel de Paris, and this railway will soon be completed to Bakou, on the western shore of the Caspian. In Circassia also the railway has made a great change. The line from Moscow to the eastern extremity of the Sea of Azov has already been extended to Vladykavkas, barely fifty miles from the central range of the Caucasus. Thus, with the greatest ease, and in the most approved methods of modern locomotion, we may drop down from St. Petersburg and Moscow to the very heart of Circassia, or proceed by steamboat and rail from Constantinople (or Liverpool) to the capital of Georgia. These are important facts, which suggest that the lover of peace and quiet who wants to secure a retired cottage for himself in the centre of Africa, on the banks of Lake Bangweolo or of Tanganyika, had better lose no time in valuing property and choosing his ground.

While touching on the Crimea, three-fourths of Captain Telfer's book, and by much the most important portion of it, relates to the southern slopes of the Caucasus—to Georgia and its adjacent provinces—only a few preliminary chapters being devoted to Sebastopol and the Crimea. Though the ground of which he treats is not unknown to English readers, and, in part, has been treated of lately by Sir Arthur Cunynghame, Baron Thielmann, and Messrs. Freshfield and Grove, it is not well known by them, and Captain Telfer had

peculiar opportunities for making acquaintance with it. Himself acquainted with the Russian language, and his wife being a Russian lady already favourably known to the English reading public by her translation of some of the tales of the great poet Poushkin; accompanied, in part of his journey, by an eminent Russian archaeologist, and being very well received by Russian officialdom, he has industriously availed himself of these and other advantages. He is also a careful observer and a voluminous recorder of what he has seen.

It is not so much a defect in these handsome and profusely illustrated volumes that their author has run the records of two separate journeys into one continuous journal, as that he does not tell us when the journeys were made. He does not spare us a vast amount of not very valuable information as to hours and days; and he so far lets us into the secret as to inform us on starting that he "entered the Black Sea at 5.20 p.m. the previous evening;" but, unfortunately, there is nothing to indicate either the month or the year of this memorable evening. In Russia matters change slowly, but still they do so with sufficient rapidity to make it desirable to know the precise year, or years, in which a traveller has made his observations. It is also matter of regret that Captain Telfer's memory, or his note-book, is not of a more discriminative kind, and that he seems to have sought to expand his materials rather than to condense and arrange them. The work is valuable chiefly for those who are visiting the Russian shores of the Black Sea, or have any very special interest in that part of the world. Readers who desire to gain—by graphic sketch, valuable generalisation and careful grouping of facts—an idea of the districts described will find that these volumes leave them to do all that work for themselves, and present what to them must be an almost intolerable mass of minute detail. In brief, this is not so much a work of travel for the general reader as a guide-book to certain parts of Southern Russia. That is where its real value lies; and, viewed in that light, it is quite unnecessarily encumbered by many of its trivial details of personal experience. It must be allowed, however, that Captain Telfer has spared no pains in making his work a valuable guide-book. He has laboriously consulted ancient authorities, and has availed himself largely of the researches of Prof. Bruun of Odessa—who was his travelling companion on part of the way, of Prof. Brosset, and of other modern writers.

Travelling in the South of Russia is about one-third cheaper than what it costs in the more civilised parts of the continent of Europe; but this cheapness is dearly purchased when the only vehicle easily available for travel is a *teléga*, more commonly called a *pereclodnaya*, "a quadrangular box firmly fixed to shafts without any springs; across its rear-half a rope is passed to and fro crossways in lieu of a seat; upon this network are piled the traveller's bed and cushion, and thus he sits throughout his journey, having to endure fearful jolting in an exquisitely uncomfort-

able position." This is worse than the seat of an Indian dawk buggy, or of a Japanese norimon; and travelling in the centre of Africa on an old cow, or on a litter carried by unwilling negroes ready to cast it on the ground without a moment's notice, compares favourably with such means of carriage. Locomotion, in the Crimea especially, is far from attractive. It certainly has none of the comforts or the rewards of travel in more civilised countries; but neither has it the attractions of the desert and of the primeval forest. There is a certain charm in carrying one's own tent (we mean in having it carried for us), in providing one's own stores, relying on one's own gun, and moving from village to village of half-hostile savages; and so there is in the hotel life of Europe; but in Russia you have all the discomfort of the one without its compensating excitement, and more than the formality of the others. The unhappy tourist must carry a black coat with him in which to meet Russian officials, though all his garments soon become very thickly populated; and, though the people among whom he is journeying are apt to wash themselves by filling their mouths with water and from thence rubbing moisture over their faces, he will probably be looked down upon as a vulgarian unless he can play the piano and is ready to drink champagne mixed with porter.

In some parts of Transcaucasia, however, and especially in Swannety, we enter on more primitive and interesting travel on horseback over high mountain-paths, with tents and with a chance of being made pot-shots of when seated at dinner in the open. Taking the railway from Poti to Tiflis as the basis of his operations, Captain Telfer made long excursions from it both to the north and south. He visited some small isolated but highly important linguistic areas, as that of the Ossets, who afford a connecting-link between the Indo-Persian and the European branches of the Indo-Germanic race. Captain Telfer thinks that the people of Swannety are a very mixed race, from the variety of physical types which they present. Their valley seems to have been a refuge for outlaws of various races, and he could hardly have seen it as he did had he not been invited to accompany the Russian chief of the district in one of the latter's periodical tours of inspection. It is curious to find that the Ossets and Swannies, wild and rude though they be, are the only primitive people of Caucasia who have raised bedsteads and stools, and do not merely squat and lie on carpets. This peculiarity, so little known in a great part of the East, is said to be shared by the people of Kafiristan, which still remains to be visited for the first time by some enterprising European traveller. Otherwise, however, they are rather a barbarous and inhospitable people in Swannety; and, without the company of Russian officials, the district should not be entered unless in a well-armed party. The paths can be ridden; but, leading over great mountains, they are trying to the nerves, never having been made for horses.

The student of archaeology will find very much of interest and importance scattered

throughout these two volumes; so will those who desire to know the dress, manners and customs of the Transcaucasians, on which Captain Telfer sometimes dwells with a minuteness which it is not unfair to ascribe to the assistance of his lady. As regards Russian rule in that part of the world, he leaves upon the reader's mind the just impression that, though there is a good deal of corruption connected with it, yet that rule was and is much needed in Caucasia. We consider that he has erred in the construction of his book. It is difficult to take interest in it as a narrative of travel when we know that "the days" which follow one another from one to ninety-two, and afford the headings of the chapters, are only fictional days. A still more serious fault is that the information he presents is scattered about all over his pages, and no sufficient attempt has been made to group its more important particulars. But it is undeniable that Captain Telfer has made an important and substantially interesting contribution to our small stock of English works on Caucasia, and that even those with the largest knowledge of the subject will glean from it a good deal that is new, and find reason to admire his accuracy in treating that which is old.

ANDREW WILSON.

FLEAY'S SHAKESPEARE MANUAL.

Shakespeare Manual. By F. G. Fleay, M.A. (London: Macmillan and Co., 1876.)

This volume is one of a series of works issued by Messrs. Macmillan and Co., constituting by themselves an almost complete *apparatus criticus* for the student of Shakespeare. This series began with the *Globe Edition*, 1864, and includes Dr. Abbott's *Shakespearean Grammar*, Mr. Skeat's *Shakespeare's Plutarch*, and the *Clarendon Press Edition* of separate plays, which is still in course of publication, the last issue, *King Lear*, being a perfect model of editing. The work undertaken by Mr. Fleay was exceedingly difficult to execute; and not the least difficulty with which he had to grapple was that of faultless accuracy in minute details. This is a point to which I must return; and, in view of what I have to say upon it, I would fain exclaim with Iago—"do not put me to 't; for I am nothing if not critical;" but if the book is to be faithfully reviewed, the unpleasant truth must be told, for the author of such a work is nothing if not accurate.

The *Manual* is in two parts, the first and more important being called a "Manual of Reference," the second "Original Investigations." If I may follow the author in the use of metaphysic-terminology, I would say that Part I. is *objective*, being based on facts, or what universally pass for such, and more or less accomplishing enduring results; while Part II. is *subjective*, owing not a little to those personal fancies which have seduced many other investigators besides the late Mr. Richard Simpson and our author from the strait path of knowledge. In his *Introduction* (p. xxi.), Mr. Fleay tells us that he desired Part I. to be as free as possible from "the subjective element." We should have had a better "Manual of Reference" if

he had fulfilled that desire. At pp. 32, 37, 42, 57, &c., we have such deliverances as these:—"I believe G. Peele wrote" an early play on the subject of *Romeo and Juliet*, remains of which are embodied in Shakespeare's; "I believe it [the French scene in *Henry V.*] to be Lodge's;" "this second hand [in *The Taming of the Shrew*] was probably T. Lodge," &c.; without any, the slightest, reason assigned for Mr. Fleay's belief. We are not interested in his *credo* except where he assigns his reasons, and most certainly that *credo* has no business in the *objective* half of his work. Where he does give his reasons, they are sometimes utterly irrelevant; e.g., where he believes that (p. 21) *Loocrine* was imitated from *Richard III.*, for in the former we read:—

"Methinks I see both armies in the field,"

and in the latter:—

"I think there be six Richmonds in the field."

A wonderful coincidence truly!

The "Manual of Reference" is, in fact (without Part II.), the student's handbook; and, if only it were accurate, it would be a most useful one. It consists of fourteen chapters, viz.:—I. Shakespeare's Life (not very accurate: e.g. he confounds Susanna with Judith Shakespeare, p. 7). II. Contemporary Allusions (extremely inaccurate and untrustworthy). III. On the Plays (a chapter which is a brief and not very accurate historical record of all that relates to the poems and plays imputed to Shakespeare, including the majority of the spurious plays). IV. On various Questions connected with the Plays and Poems (a chapter which, for the most part, consists of critical discussions). V. On Pronunciation and Metre (perhaps the best chapter in the book, though hardly doing full justice to Mr. A. J. Ellis's labours, on which Mr. Fleay's summary is confessedly based). VI. On the Manner of Stage Representation. VII. On the earliest English Theatrical Companies. VIII. On the Theatres from 1576–1642. IX. On the Dramatic Authors contemporary with Shakespeare (an excellent chapter, but in a few places needing correction). X. Chronological Table of miscellaneous Matters relating to the Theatre. XI. List of Books, &c., for a Student. XII. On Tests of Authorship (an unsatisfactory chapter). XIII. On Emendation (too short to be of any use). And XIV. On the Actors of the Elizabethan Plays. This (which is a most useful chapter) brings Part I. to a conclusion.

Mr. Fleay, besides having largely contributed to the *Transactions* of the New Shakspeare Society, has written several Shakespeare papers in periodicals; in particular in the numbers of *Macmillan's Magazine* for September 1874, and March and November, 1875. The former contains his reasons for believing that Shakespeare's *Sonnets* 1–126 constitute one poem addressed to Lord Southampton; the latter his reasons for attributing 2 and 3 *Henry VI.* to Peele and Marlow, and *Titus Andronicus* to Marlow alone. These papers are not reprinted in the *Manual*; and it is somewhat unsatisfactory to find the conclusions asserted without the reasons, with a bare reference to two of the papers in *Macmil-*

lan's Magazine (pp. xxi., 5, 43, 44, and 58). It is, indeed, true that to have reprinted them would have swelled the book to undue dimensions; but a few extracts from them would have sufficed for the purpose of corroboration; and, in my opinion, most of the "Original Investigations" might, with advantage, have been omitted from this volume, and reserved for one of a very different character.

I find two salient faults in the *Manual*. As a whole it is, I think, a helpful work for the student; but, nevertheless, Mr. Fleay's manner of confident self-assertion and his general want of scrupulous accuracy are very misleading. The student would find this book far more helpful, if there were more of the *ipsissima verba* of others, and less of Mr. Fleay's *ipse dixit*. I say this out of no animosity towards a seceding member of the committee of the New Shakspeare Society, but simply in the interest of Shakespearian students. By all means let them buy the *Manual* and verify it as they use it: but, nevertheless, in its present condition it is not fit to serve as an objective text-book. In a second edition, if Mr. Fleay be willing to mistrust, in some measure, his own judgment, and pay more deference to the judgment of others, the book may very well be all that could be wished. Like the fabled beaver that bit off his tail and left it a prey to the hunters, the "Manual of Reference" may yet save itself by separation from the "Original Investigations," leaving them at the mercy of controversial critics.

The charge of great inaccuracy must not be made without adducing a few specimens (selected from a considerable list) in support of it. Chapter ii. is, as I have said, extremely inaccurate in its quotations. From *Green's Groatsworth of Wit*, 1592 (even the title is inaccurately given), we have:—

"An upstart crow beautified in our feathers," &c. for

"an upstart Crow, beautified with our feathers," &c.

From Chettle's *Kind-Harts Dreame*, 1592 (not "*Kind Hart*," as Mr. Fleay gives it), we have two more blunders, one of which is serious: viz., "than excellent," &c., for "than he exelent," &c.; and "that approves his wit" instead of "that aprooves his Art." From *The Returne from Pernassus*, 1606 (the title being again inaccurately given), "He is a shrewd fellow, indeed," instead of "It's a shrewd fellow indeed." In the first quotation from Meres' *Palladis Janua*, 1598, there are several inaccuracies. The extract from Barnefield has one mistake, and it is said to be taken from his *Poems and Divers Persons*, 1598; whereas it occurs in his *Poems in Divers Humors*. In Weever's epigram there is one mistake, and a wrong date is assigned to the collection in which it occurs, viz., 1596, instead of 1595. On the same page, viz. 15, we have an extract from John Davies, of Hereford, attributed to Sir John Davies: the blunder also appearing on p. 8. Both were poets, but as there were two poets thus named, so there are poets and poets: and the gifted Chief Justice would not have felt flattered by being credited with the doggerel of the Puritan writing-master. To a young student the blunder is misleading, for he ought to be informed that in Sir John

Davies' works there is no evidence that the Judge so much as knew of Shakespeare's existence; whereas the Puritan Davies has three allusions to Shakespeare, one of which is unaccountably omitted from this chapter. In the extract from Chettle's *England's Mourning Garment*, 1603, "And to his lines," &c., is an error for "And to his lays," &c.; with many more like mistakes. Such a chapter as this is simply worse than useless. To the student it is but "a delusion and a snare."

On p. 41 we have two misquotations, one from Thomas Nash's epistle prefixed to Robert Greene's *Menaphon*; and one from Thomas Lodge's *Wits Miserie and the World's Madnesse*. I here put Mr. Fleay's version under the original in each case.

Nash, 1616, p. 5:—

"Whole Hamlets, I should say, handfuls of Tragical speeches."

"Whole Hamlets or handfuls of tragical speeches."

—Fleay.

(The editor of 1589 differs only in the italics of "*hamlets*," and the small initial of that word and "tragical.")

Lodge, 1596:—

"y^e ghost which cried so miserably at y^e theator like an oister wife, *Hamlet revenge*."

"the Ghost that cried, 'Hamlet, revenge! so miserably.'"—Fleay.

The latter misquotation only is serious. As Mr. Fleay gives it, a recently-suggested interpretation of this obscure passage is rendered inapplicable.

On p. 307 we have a line misquoted from Spenser's *Colin Clout's come home again*, 1595; viz.:—

"Whose Muse like his high thought's invention," where the original reads:—

"Whose Muse, full of high thoughts invention;" and another line from the same, which is rightly quoted on p. 307, is misquoted on p. 309.

In Chapter vi., towards the end of an imaginary report of the representation of *Romeo and Juliet* in 1596, is an inaccuracy respecting what would then be a long performance. "The play must have lasted more than two hours; a long performance to-day." In the prologue to *Romeo and Juliet*, "the two-hours traffic of our stage" shows that to have been (in round numbers) the duration of that play: but "more than two hours" would not have made "a long performance," for some of Beaumont and Fletcher's plays lasted three hours. Doubtless Mr. Fleay knew all this, but his expressions are inaccurate and misleading. I pass over a great number of small errors, as in dates and numbers, and proceed to a more serious charge relating to Chapters iii., iv., and xii. of the "Manual of Reference," and to Chapters i., iii.-ix. of the "Original Investigations."

Our author's name is almost identified with the subject of metrical tests; and it was to be expected, and indeed desired, that the subject should be adequately represented in the *Manual*. In Chapter iv. of the "Manual of Reference" (p. 60), we are suddenly confronted with the following assertion:—

"Of these results [as to the probable interpolations in the plays] those concerning the *Two Noble Kinsmen* (Hickson and Spalding, after Weber), *Henry VIII.* (Spedding [it should be Hickson and Spedding]), *Troilus and Cressida* (Dyce and

Fleay), *Timon of Athens* (Fleay), *Pericles* (Fleay), *Taming of the Shrew* (Fleay), are granted by all the best critics ;

and Mr. Fleay proceeds to state that his results as to *Macbeth*, *Romeo and Juliet*, *Richard III.*, *Henry VI.*, *Edward III.*, *Julius Caesar*, and Staunton's as to the *Tempest*, "are yet disputed." We naturally rub our eyes and read this again and again, to be quite sure that it is so stated: for no member of the New Shakspeare Society knows better than Mr. Fleay that the statement is unfounded. Did he make it in revenge for his own discomfiture, as if he had said to himself, "'s death, I'll print it, and shame the fools"? The simple truth is, that "the best critics" have not accepted Mr. Fleay's results, nor the process by which he obtained them, in all the cases stated: but, on the contrary, his paper on the *Taming of the Shrew*, contributed to the *Transactions of the New Shakspeare Society*, was utterly demolished the day after the Shakespeare Anniversary of 1874 at a meeting of that Society: and the condemnation then arrived at has, I believe, with the possible exception of Dr. Abbott, been concurred in by all Shakespeare critics of any standing whatever.

The assumption which covertly weakens Mr. Fleay's method of testing authorship is that a poet's intellectual and moral development is always progressive and at a uniform rate of progress. But in every man's life there are periods of moral and artistic retrogression, and these are ignored by this eminent metricist; and the false assumption thus underlying the method is fatal to its exactitude. In its application to Beaumont and Fletcher, and to Massinger in particular (p. 154), his conclusions are to a great extent based on aesthetic grounds, which he professes to exclude (Introduction, p. xx.), and so far they are valuable; but in so far as they are based on metrical grounds, they are comparatively worthless, for his tables do not contain the total number of verse-lines in the plays registered, and so do not furnish an absolute standard-test of authorship. Just so the late Mr. Buckle's inferences from a table of the numbers of suicides in London for each of five successive years were invalidated by his omission to consider the population and total number of deaths for each year. As it seems to me, Mr. Fleay has attempted to cover too much ground for a student's manual. To treat the theory and application of metrical tests effectively a separate volume should be devoted to the subject: and we have no doubt whatever of Mr. Fleay's "stuffed sufficiency" for accomplishing such a work. The mere reprint of his separate papers, some unchanged, others partly recomposed, is quite inadequate to serve as a guide to the student. The want of systematic development alone unfits them for that function. The mere absence of definitions is a needless difficulty, especially where the terminology is so novel and imperfect as in metrical tests. No student, however sagacious, could guess what a *double ending* or a *female ending* could possibly mean, apart from examples, to be sought out and applied. He would never suspect that a line with a single ending could ever be said to have a double ending:

and the introduction of sex surely does not help the matter a jot. The whole thing is too crude, imperfect, subjective, and one-sided, as it stands, in Part II., to serve any other end than a hindrance to the student. Nay, more: Mr. Fleay himself seems not to have made up his own mind on several of the issues raised: and his deliverances are sometimes quite inconsistent with each other, or do not convey his real meaning. We actually find him denying (on metrical grounds) the prose scenes of a play to Shakespeare! yet we cannot think for a moment that he meant that. See p. 52, where he states the *Two Noble Kinsmen* to be the joint work of Shakespeare and Fletcher; and he restricts Shakespeare's part to i., iii., 1 and 2, and v., 1, 3 and 4. But he knew quite well that ii. 1, and iv. 3, are Shakespeare's too; only he was too full of metrical tests to think of the prose scenes.

Whatever may be thought of Mr. Fleay's method of metrical tests (and in the case of *Pericles* and *Timon* I think his work is eminently good) it was a very unfair proceeding to reprint his New Shakspeare Society papers without reproducing the arguments employed against them; which, at least in the case of one play, have been confessedly successful. In the Introduction (p. xx.) he tells us that these papers were added at the suggestion of Mr. J. R. Green. It is not likely that, in making the suggestion, Mr. Green dreamt of so unfair a proceeding as that of giving the papers without the replies. The student who uses this manual will regret the absence of an index: one of the greatest drawbacks to the usefulness of such a work. For my own part—though it is likely some readers will not agree with me here—I regret that the book should have been printed on paper of a yellowish tint, which is peculiarly trying to weak eyes. If publishers are not superior to the vanity of imitating the venerable discoloration of age, they ought, in regard to the interests of posterity, to print in the blackest ink on the whitest paper.

C. M. INGLEBY.

Tobacco: its History and Associations, including an Account of the Plant, and its Manufacture; with its Modes of use in all Ages and Countries. By F. W. Fairholt, F.S.A. (London: Chatto & Windus, 1876.)

AN ancient Mexican legend asserts that tobacco was smoked at the creation of man, and although we may not have sufficient faith to agree to the truth of this very early date, we can safely accept the old Indian traditions of its great antiquity on the American continent. Although Columbus noticed the custom of smoking in his second voyage, in 1494, tobacco was not introduced into Europe until nearly seventy years after that date. Jean Nicot, Lord of Villemain, Master of the Requests of the French King's household, and ambassador to the Portuguese Court, purchased, while at Lisbon, some tobacco seed from a Flemish merchant who had obtained it in Florida, and on his return to France in 1561 he presented to Catharine de Medicis a few of the plants obtained from this seed. Sir John Hawkins is believed to have

brought tobacco into England four years after this, but the honour of being the first English smoker, which is usually given to Sir Walter Raleigh, appears to belong to Ralph Lane, who was sent out by Raleigh as governor of Virginia, and returned to England in 1586.

On its first introduction tobacco was supposed to produce the most remarkable sanitary effects, and was in consequence named *Herba panacea*, and *Herba sancta*. Spenser calls it *divine tobacco*, and includes it among the medicinal herbs mentioned in the *Faery Queen*, and Lilly, the Euphuist, describes our *holy herb Nicotian* as a cure for a spear-wound. Others prescribed it as a cure for the plague. Although tobacco has been in use in Europe for two centuries and a half, and its friends and enemies have fought and are fighting over it, nothing satisfactory has yet been settled by any impartial judge as to its evil or beneficial effect upon the constitution. Smokers see nothing but good in it, and non-smokers nothing but ill, and although all agree as to the evil of excess, few will agree as to what excess is. The German who smokes his sixteen penny cigars before 3 o'clock in the afternoon never suspects that he is other than a moderate smoker. The smokers, however, are on the winning side. They have passed through persecution and, having suffered, they are now aggressive. Obstacles clear away before their determined action. Railway platforms are open to the smokers, cigar or pipe in mouth. Carriages are set aside for them, and ladies with a cough intimate that they rather like the smell of smoke. According to Mr. Lane, tobacco was introduced into Turkey and Arabia in the beginning of the seventeenth century, and in 1601 it is known to have been carried to Java. Turks and Persians at first declared smoking to be a sin against their holy religion, and to render the custom ridiculous a Turk who had been found smoking was conducted through the streets of Constantinople with a pipe transfixed through his nose. The traveller Sandys saw an unfortunate so treated in the year 1610.

Celebrated men have been pretty equally ranged under the respective banners of the smokers and non-smokers. James I., Louis XIV., Taylor the Water-poet, Penn the Quaker, Cowper, Goethe, Balzac, and Dumas, are among the haters; and Frederick I. of Prussia, whose "Tabaks Collegium" was the cabinet council of the country, Hobbes of Malmesbury, Dean Aldrich, Sir Isaac Newton, Dr. Parr, Robert Hall, Charles Lamb, Scott, Campbell, and Byron, among the lovers of the weed. All these last, and many more, could sing with the authors of *Odes and Addresses to Great People* (Hood and Hamilton Reynolds)—

"How oft this fragrant smoke upcurled
Hath borne me from this little world,
And all that in it lies."

There are fashions in the manner of smoking as in other things, and the two extremes are reached on the one side in the German pipes, some of which will hold an ounce of tobacco, and on the other in the Japanese pipes that only contain sufficient for two whiffs. The largest pipe in existence is the kiln prepared at the Docks for the

burning of damaged tobacco, which goes by the name of "Her Majesty's tobacco-pipe." The North American Indians are excessive smokers, and a savage in want of his pipe has been known to dig a small hole in the ground, light his tobacco in it, and draw the smoke through a reed. Various materials have been smoked by the poor as substitutes for tobacco, such as white moss in the Highlands, and eye-bright, dock, camomile, and other herbs, in England; and Mr. Fairholt knew a gentleman who smoked tea.

Tobacco is a hardy flowering perennial plant, which grows freely in a rich moist soil. It may be raised without difficulty from the equator to 50° of latitude, but speedily exhausts the soil, as may be judged from the large amount of ash which it contains. Every ton of perfectly dry leaves carries off from the soil from four to five hundredweight of mineral matter—that is, as much as is contained in fourteen tons of the grain of wheat.

Cigars and cigarettes have banished pipes from Spain; and there is a Spanish proverb to the effect that "a paper cigarette, a glass of fresh water, and the kiss of a pretty girl will sustain a man for a day without eating." Pipes have of late years come more into favour in England; and those who cannot afford high-priced cigars do well to shun the cheap ones, which are said, on the authority of a Parliamentary return, to consist of

"sugar, alum, lime, flour of meal, rhubarb leaves, saltpetre, fuller's earth, starch, malt commings, chromate of lead, peat moss, treacle, common burdock leaves, common salt, endive leaves, lamp-black, gum, red dye and black dye composed of vegetable red, iron, and liquorice. . . Havannahs," at one penny each, "are sometimes steeped in an infusion of strong tobacco water, to give them a little external flavour of a true kind."

In noticing the uses that have been made of tobacco, it is necessary to mention the practice of chewing, which was followed by the Indians to stay hunger in travel, and is often adopted by soldiers and sailors for the same reason. General Monk sanctioned the habit; and in the seventeenth century it was usual for gentlemen to carry about with them silver basins to spit in, and this was done with an air of distinction.

The custom of snuff-taking, although now treated with disfavour, and looked upon as a dirty habit, was once indulged in by all who wished to make a figure in the world, and the proper mode of carrying a snuff-box was a mark of fashionable culture.

A list of distinguished snuff-takers would be a long one. Frederick the Great loved snuff "so entirely that he had capacious pockets made to his waistcoat that he might have as little trouble as possible in getting for immediate use the largest quantity he could desire," and

"Talleyrand argued that snuff-taking was essential to all great politicians, as it gave them time for thought in answering awkward questions while pretending only to indulge in a pinch; or a proper management of the box enabled them to adapt themselves to many temporary necessities of diplomacy."

Snuff-takers sometimes became snuff-collectors, and the Earl of Harrington was one of these:—

"He spared no expense in procuring snuffs of

all kinds, and devoted one room of his mansion in Whitehall Gardens to properly storing them all. That room was a curiosity in its way, with its rows of well-made jars and proper materials of all kinds for the due admixture and management of the snuffs they contained, under the able superintendence of a well-informed man, who was the guardian angel thereof. After the Earl's death the collection was sold, and prices that seem fabulous to the uninitiated were realised for the finest sorts."

Pope Urban VIII. published a bull against the use of snuff in 1624, but a century after Benedict XIV. revoked it because he himself had become a snuff-taker. Louis XIV. had an antipathy to snuff, as he had to tobacco in every form, and the royal physician, Mons. Fagon, is said to have devoted his best energies to the composition of an oration on the evils of snuff-taking. The orator, however, failed to convince his audience, because, when most excited, he had frequent recourse to his own snuff-box.

Snuff-boxes were profusely ornamented, and it became a practice at Courts to present these handsome baubles to foreign ministers. Messrs. Rundell and Bridge received 8,205*l.* 15*s.* 5*d.* for snuff-boxes so given at the coronation of George IV. Wicked people whispered that the same boxes did duty again and again. Thus the ambassador would send the newly-presented box to the jeweller, who gave him a consideration for it, and on the next occasion that a snuff-box was required the purchaser delivered his second-hand box at the palace as a new one.

The late Mr. Fairholt's qualifications for the office of historiographer of tobacco appear in his pleasant dedication to Mr. Roach Smith, where he writes:—

"Born in London, and never having been out of sight of St. Paul's until I had reached my twenty-second year, the tobacco-warehouse where my father worked became my playground, and my first remembrances are of rolling in the tobacco-leaf as country children would roll in a hayfield, and playing at hide-and-seek in the empty barrels."

He produced a book which does credit both to his pen and his pencil, and is a capital monograph on an interesting subject. The publishers have re-issued the book in a pretty form, but they nowhere state that it was first printed in 1859, and that the author died on April 3, 1866. HENRY B. WHEATLEY.

Encyclopædia Britannica. Ninth Edition. Vol. IV. (Bok-Can.) (Edinburgh: A. & C. Black, 1876.)

THE three earlier volumes of the *Encyclopædia Britannica* have been already reviewed at some length in these columns, the first by the writer of the present notice. It is now needless to commend this great work to the good-will of the public; nor is it even necessary to state that the pre-eminent standard of excellence continues to be fully maintained. But the issue of a new volume seems to demand some words of critical comment. It is impossible, of course, to do justice to such a weighty body of varied learning as is contained in these 800 quarto pages of close type. The functions of the reviewer are perforce torn from him; and he is compelled to confess that he is relegated to the position of an ordinary reader.

The advertisement exhibiting the principal contents, with the names of the contributors, is in itself the most favourable, and perhaps the most adequate, recommendation that such a work as this can possess. The articles on "Botany" and "Bridges," by two Edinburgh professors, and that on "Building" by Mr. W. Papworth, are the chief monuments of special erudition in the present volume, of which they occupy together just one-fourth. The second and third of these especially commend themselves to a layman for their exhaustive and lucid treatment. "Brewing," by Mr. S. A. Wylie, is also expounded in a way that is both thorough and interesting; but "Canal," by Mr. D. Stevenson, may be thought to omit some aspects of the subject, which would, no doubt, have found their place if the article had been longer.

After these branches of specialised knowledge, the geographical articles come next in importance. "Bolivia" and "Brazil," by Mr. Keith Johnston, are models of what such articles should be. The fresh experience of the writer is combined with the latest statistical information, and every aspect of these countries is brought vividly before the reader. "Burmah" and "Cambodia"—the first unsigned, the latter by Colonel Yule—are scarcely less satisfactory; nor should the longer accounts of "California" and "Canada" be passed over. Among minor notices, those on places in Persia deserve attention, if only because the signature of Sir H. Rawlinson shows the authoritative supervision which they have received. In this connexion, it may be suggested that the sketch-maps and plans of towns, scattered through the work, are deplorably inferior to the letter-press. In not a few cases the names on the maps are illegible; and most of the plans would be more effective for illustration if the names of the streets, &c., were universally banished to the margin.

But the staple of this fourth volume is Biography. The curious may sometimes have noticed that among names of persons, particularly of Englishmen, the letter B is by far the most common initial. We find, accordingly, that the number of distinguished lives presented to us is unusually great on this occasion; and it happens that the great majority of them belong to modern times. Literature figures most strongly, and in literature, the poets. Mrs. Browning, Burns, Byron, and Campbell, fill no small share in the poetical world of the last hundred years; and Calderon and Camoens represent the verse-writers of the Iberian peninsula. In other walks of literature are Bolingbroke, Brougham, Buckle, Buffon, Bunsen, Burke, and the two Butlers; while Caesar and Calvin occupy the position of epoch-making heroes. It would be untrue to suggest that the treatment of all these names is equally meritorious. "Burke," by Mr. J. Morley, is the best, where many are good. The present generation, unfortunately, knows but little of that great man, whose national services and literary ability it would be difficult to parallel. We should be glad if the writer of this biography would undertake to expand it into an independent book; but even as it stands it is worthy of being com-

pared with lives written under similar circumstances by De Quincey and Macaulay. "Bolingbroke," by Mr. R. Adamson (the successor to Professor Jevons at Owens College) is disappointing; and it is not a sufficient excuse to put the old question, "Who now reads Bolingbroke?" But "Bishop Butler," by the same writer, more than satisfies our expectation. This article comes only second to that on "Burke." In competent knowledge, philosophical acumen, judicial impartiality, and clearness of style, the new professor has at once established his reputation. "Dr. Thomas Brown," the Scotch philosopher, is also by Professor Adamson. Among the poets, "Byron" is, perhaps, the best, though the task of the writer, Mr. W. Minto, was by no means the least hazardous. It is, indeed, impossible to over-estimate the difficulty of writing adequately a critical Life, in a case where the private incidents are no less familiar to thousands than are the public works. With a politician, the incidents are the life; but in the case of a poet, his work is so inextricably interwoven with his outer life that the views which we entertain of the one must of necessity determine our opinion of the other. In his article on "Burns," Professor Nichol has failed in the attempt. The memoir is too slight, and smoothly passes over certain events which had a predominating influence on the poet; the pardonable sentiment of patriotism, which in such a connexion needs not to be vaunted, openly takes the place of criticism; but, above all, the style of the article is faulty to a degree which is unaccountable. Burns' first connexion with Jean Armour is confused, and not illustrated, by the hackneyed quotation from Gibbon's autobiography, in which he antithetically describes his single love-adventure. In four columns there may be discovered at least five quotations from Tennyson, and twice as many more from the better-known portions of Shakspeare, Milton, Keats, and Browning, intermingled promiscuously with tags from Burns; while the poet himself is illustrated by two consecutive stanzas, which even most Englishmen are in the habit of carrying in their heads. "Mrs. Browning" is briefly, but appreciatively, criticised by Mr. G. Barnett Smith, though it may be doubted whether "imagination," in the common meaning of the word, is justly denied to that gifted woman. The Life of Buckle is well narrated, but his historical doctrines are somewhat roughly handled by Prof. Flint. "Bunsen" is written by his own son. "Lord Brougham" and "Lord Campbell" are interesting, but not attractive. The authors of *Hudibras* and the *Religio Medici* are both particularly well treated. "Calvin" is from the pen of the Rev. W. L. Alexander, which in itself is a sufficient guarantee both of knowledge and liberality of thought. Mr. Oscar Browning describes, in language of especial force, what it was that Caesar did; but scarcely attempts to pourtray the man as he was.

This volume happens to be exceptionally deficient in articles bearing on Theology. Apart from "Calvin," which only introduces incidentally the body of doctrines known as Calvinism, there is little beyond a striking

article on "The Canaanites," by the Rev. T. K. Cheyne. Of miscellaneous articles, again, there are not many worthy of notice. The most important of those that may be brought under this class is "Breeds," by Mr. F. Darwin, in which the father's views on the variation of animals and plants under domestication are enforced, with even more than the father's lucidity.

There are many articles left on which we had proposed to say something. But we have wellnigh exhausted our whole vocabulary of approving epithets. It remains to say that in course of reading steadily through large consecutive portions of this book, out of regard to our duty as a reviewer, we have been led to view the *Encyclopaedia Britannica*, not only as a utilitarian book of reference, but as a source of genuine literary pleasure, such as even Charles Lamb would not have disdained. JAS. S. COTTON.

Records of the Gupta Dynasty. Illustrated by Inscriptions, Written History, Local Traditions, and Coins. To which is added a Chapter on the Arabs in Sind. By Edward Thomas, F.R.S. (London: Trübner & Co., 1876.)

"It would contribute very material aid towards the reconstruction of the general chronology of India," says the learned author of this illustrated folio, after enumerating certain Indo-Scythian inscriptions in the Indo-Baktrian and Baktrian-Pali alphabets respectively, "if we could determine the era to which these inscription dates refer; it is clear that many of them are mere regnal dates, but as some of them run up as high as ninety-eight, this alone puts them beyond such confined system of reckoning, and even outside the probable duration of the combined reign of the three brothers, Hushka, Jushka, and Kanishka of the Kashmir chronicles."

Truly the question is full of perplexity. Vikramāditya gives as a starting-point, B.C. 57; Saka, A.D. 79; the Seleucid reckoning, B.C. 312, with "the omission of the current figure for *hundreds*;" and Mr. Thomas prefers the last as most suitable to work out his wished-for results. Though his arguments do not carry conviction, and he scarcely writes as expecting them to do so, his republished letter on the subject to the ACADEMY may be commended to readers interested in the subject as deserving of attentive perusal; and the late introduction of a fourth, or Parthian era, supplies important auxiliary data to students of Indian archaeology.

But he adds to Kanishka and Huvishka or Hushka (page 16), in classifying the Mathura inscriptions, the name of an Indo-Scythian king, Vāsudeva; and it is with reference to this very monarch that, in one of the latest issues of the Royal Asiatic Society's *Journal*, Prof. Dowson discusses practically the difficulty above expressed. He believes the designation to belong to the year 5 (Samvāt), and it is also apparent to him in 45 and 98. The suggestion that it be accepted as a Hindú royal appellation, and therefore applicable to more than one individual of the Scythic dynasty, is clearly not discarded by Mr. Thomas, who

uses the words "name or title;" and it is, without doubt, plausible. Vāsudeva, in the common interpretation of the word, may be the father of Krishna, or a son of Krishna; it is a name borne by Hindus at the present day. More to the point still, Bās Deo (which is "Vās deo," or by other transliteration, "Vāsa deva,") was the Emperor of Kanauj in A.D. 330, mentioned by Cedrenas, writing in the eleventh century, as the sovereign who sent Mitrodorus with presents to Constantine. Certainly if this Mitrodorus be the "clumsy creation" supposed probable by Mr. Priaux in reviewing the Indian Embassies to Rome, at p. 184 of his recent *Apollonius of Tyana*, his Imperial master may be fictitious also; but the immediate successor of Anangpāl, the founder of Dehli, who flourished in Vikramāditya 429 (A.D. 372), was, according to Abul Fadhl and Farishta, "Bāsdeo." Here, then, we have, at least, one great potentate of the name, the position given to whom by Muslim annalists in pre-Hijra history seems to be chronologically corroborated by a Christian writer. So that, name or title, "Vāsudeva" may be considered regal and traditional; and its identification with a living monarch of the fourth century of the Christian era renders it highly probable that it may have been applied to a predecessor in and before the first. The particular king signified in the Mathura Inscriptions was supposed by General Cunningham to have reigned from B.C. 13 to A.D. 26, a period prolonged on later evidence to A.D. 41. He bears the title of *Deva-putra*, applied to Kanishka in Bahawalpur, and is identified as an Indo-Scythian.

After all, it may be said, this question of the Mathura Inscriptions, well as it illustrates one of the many difficulties experienced by the scientific numismatist, does not fairly express the gist of the present publication. The Kashmir triad and Vāsudeva form rather an episode than the true text of the volume we are called upon to notice. The specimen prototype of this same Vāsudeva is only prefixed as "introductory to the Gupta gold coinage;" and finds no place in the well-executed autotype plate which exhibits "the exclusively continuous Gupta series." But in a late prospectus of the *International Numismata Orientalia*, we observe that General Cunningham will now be able "to prefix to the Indo-Scythian series, to which he is already pledged, a full and elaborated review of the Baktrian successors of Alexander;" and we may hope, amid his results, to find the link between these comparatively modern Guptas and more ancient but better known names. We gather from Abul Fadhl—using Gladwin's translation, without his orthography—that Hushka, Jushka or Zushka, and Kanishka, were preceded by Damodhar, Jaloka, and Asoka; and here, though many gaps are naturally unfilled, there is at once opened out a range of enquiry the more interesting because the more familiar. In no passage of his book will Mr. Thomas command so much general sympathy as when (p. 27) he quotes an inscription referring to a restoration of "the dam or bridge which retained the waters of the Palesari river." This is called the "Sah, or Rudra Dama Inscription,

Junágarh;" and it recites the name of the Maurya Raja Chandra Gupta, the Sandrocottus, or Sandroktopos of our school forms, and less directly that of the renowned Asoka Maurya, whom we are taught to accept as his grandson. Those who have studied the *Asiatic Researches* will perhaps remember Mr. Wilford's "Allitrochades," or "Amitrochades," the son of this Chandra Gupta, a name he thought derivable from Mitra-Gupta.* Such a line of enquiry takes us back at least to B.C. 312, or to the first year of the Seleucidan Era.

In conclusion it may safely be admitted that Mr. Thomas, a true archaeologist as well as most distinguished numismatist, has again earned the acknowledgments of students of Indian history by putting before them valuable details elucidating the reality of ancient dynasties. The discussion is not strictly new; and, indeed, the greater part of the matter from page 38 to page 43 is a reprint from the writer's previous contributions to Vol. x., Part 2 of the *Journal of the Royal Asiatic Society*; but the materials, thus collected in a compact form and carefully annotated, are instructive and inviting. He has arranged them so as to determine "the age and the spread of the dominions of the Guptas," under the four heads of Inscriptions, Written History, Traditions, and Coins; and each division is treated with scholarly acumen. The Sâh kings of Surashtra are separately examined by the light of inscriptions and coins; and there are some interesting remarks added on the probable processes of use and decay to which the Greek language was subjected in India. The remainder of the work is perhaps more strictly numismatic in character; and concludes with an analysis of certain Arab coins chiefly bearing upon early Muhammadan rule in the Province of Sind. There is very much to be said on the history connected with these, many available data for which have yet to be collected and put into readable shape. But the subject is worthy of a separate article, and cannot be treated in two or three lines. F. J. GOLDSMID.

NEW NOVELS.

Martin Laws. (London: Samuel Tinsley, 1876.)

The Days of His Vanity. By Sydney Grundy. (London: Samuel Tinsley, 1876.)

The Pennant Family. By Anne Beale. (London: Hurst & Blackett, 1876.)

Fashion and Passion. By the Duke de Medina Pomar. (London: Chapman & Hall, 1876.)

A Woman Scorned. By E. Owens Blackburne. (London: Tinsley Brothers, 1876.)

The Mystery of Orleton Manor. By Robert Jewell. (London: James Blackwood & Co., 1876.)

It will be tolerably evident to the instructed reader that *Martin Laws* is an eldest child. As such, and because it is free from the pretentiousness, silliness, and bad taste which too often disfigure first attempts, it deserves

lenient treatment. Indeed, there has apparently been bestowed upon the book an amount of painstaking which is worthy of all praise, though the pains have not always been taken according to knowledge. The author should guard against such provincialisms and solecisms as "she went out middle-day," "without he could prove," "you will come along, papa," "between you and I." He should also not talk of a sermon being "one long peroration," or of "replenishing embers." He has, moreover, to look to a very common defect, that of introducing characters which apparently are going to have something important to do with the action and really do nothing at all. Such a character is the Rev. Mr. Barrow, about whose character and antecedents many dark and apparently suggestive hints are given, and who yet fades like an unsubstantial pageant. This error is, perhaps, in a great measure consequent upon another, that of introducing too many characters. At least half of the personages of *Martin Laws* might with advantage be struck out or reduced to the rank of *mutae personae*. These mistakes, however, are almost inevitably committed at first by all authors except those of the greatest genius, and nobody need be discouraged by the pointing out of their commission. The book is on the whole a very fair attempt in a praiseworthy kind, the kind which aims at faithful rendering of ordinary scenery and ordinary character. The fortunes and surroundings of the waif Martin Laws are a little suggestive of those of *John Halifax*, and the tone of the book is somewhat similar, but there is no imitation. It is impossible not to look with some favour on a book which is neither mawkish on the one hand, nor disfigured by the bumpions bad taste which too often attends efforts to avoid mawkishness.

The Days of His Vanity is cast in a more ambitious mould and compact of more perilous stuff. Mr. Sydney Grundy (if, indeed, he be not an aspiring individual of the sex which his famous namesake adorns) is apparently a member of one of the Honourable Societies which dwell west of Whitefriars, if we may judge from his prettily expressed compassion for "the hearts that are breaking before the mystery of things in those chambers in the Temple where so many of the flower of English youth are living lonely lives." He may also be a university man, though his phrase of "being at college" with some one savours rather of the outer world. At any rate he shows some signs of the form and pressure of the time, can talk with a melancholy compassion of religion, doubts the immortality of his soul with due discomfort, and is very virtuously indignant at commonplace virtue. And it has seemed good to him to write a novel at which we should like not to laugh, because there is an air of sincerity about it, and because the riddle of the painful earth is undoubtedly painful and perplexing, however it be stated. But we think that Mr. Grundy if he will coolly read his own book will see that it is hardly fair to curse, Porson-fashion, the "course of events" when it is the actors who are in fault. The fate of his Vane family is no doubt sad. It is very distressing that a young girl should

die just as she is going to be married, that her mother should follow her to the grave by reason of brandy and despair, and that her younger sister should go to the bad in consequence of friendlessness and of settlements carelessly drawn and not very honestly administered. But it must be a curiously perverted view of these events which leads people to shake their fists in the face of Heaven because every one is not wheeled in a perambulator direct to Paradise. It seems to Mr. Grundy very wrong that evil acts should, as a rule, do harm to others than the actor; does he think that the laws of mechanics are wicked because it is the hit rather than the hitter who usually tumbles down? It would also, perhaps, be well not to begin and end "books" with the repeated statement that "the sun is shining upon the river and the river is streaming on," because memories of Mr. Lewis Carroll and of "C. S. C." are apt to arise. Moreover, who gave Mr. Grundy leave to speak of England's greatest novelist—of the greatest, perhaps, that the world has seen—as "jolly, genial old Thackeray"?

Since we are in the questioning vein we may ask at what period during the present century was it customary for Welsh Earls to ride about the cliffs at night with dark lanterns at their horses' heads, on wrecking thoughts intent? The answer to this question will give the exact date of the events recorded in *The Pennant Family*, a date which it would be interesting to know. The Earl in question is a very peculiar person, and appears to have been as confused in his notions of law and history as in his ideas of morality, for we find him threatening a young lady who has displeased him that she shall be "burnt for a witch." Miss Beale informs us that one of her characters unconsciously used the words "Take him up tenderly, Lift him with care," years before they were used by Hood—a very interesting fact, which corroborates our previous impression that all the poetry of the Saxon has been anticipated by the bards of the Principality. Despite these oddities, there is a good deal that is really pathetic in *The Pennant Family*, though it is impossible not to feel keenly the want of descriptive power. Some of the wrecking scenes, though improbable, afford magnificent opportunities, and the opportunities are not taken. As an illustration of the fine old poetical justice which is now so thoroughly out of fashion, the book will perhaps interest some people.

We must own to a hearty wish that the Duke de Medina Pomar could find in his heart to bestow a little less of his industry upon the public. It is but three or four months since our table groaned under the three mighty volumes of *Through the Ages*: and to meet the noble and gifted author of that stupendous work again so soon is almost too much for us. *Fashion and Passion* is, however, interesting as showing that when a man has with great trouble written a very silly book with a serious purpose, it is still possible for him by taking thought to add a cubit to the stature of his folly. The Duke requests us in a jaunty preface to call his present book "fast" or "improper:" this we certainly shall not do; first,

* Volume v., quoted by Maurice, in *Modern History of Hindostan*, vol. i. part 1.

because a book can hardly be fast when it is intensely slow, and, secondly, because whatever we may think of this young gentleman's intellect we see no reason to find fault with his morals. There can be nothing very vicious about an author who takes the trouble to christen all his chapters after popular novels. But there is one thing in the book which neither the Duke de Medina Pomar's extreme youth nor his possibly imperfect acquaintance with English notions of the conduct of a gentleman can excuse. To introduce half the leaders of English society in a novel under the thinnest possible disguises of their names and titles, to drag in descriptions of their houses, their habits, and their personal appearance, is simply to take an unwarrantable liberty—a liberty which not so very many years ago would have subjected the offender to unpleasant consequences. If the disuse of the old rough-and-ready methods of correction permits this sort of thing the sooner they cease to be obsolete the better. It is true that in the present case the book in which these personalities occur is so childish that no one can be seriously offended. But even children should be taught good manners. We can compliment the author on his style as little as on his good taste. On two consecutive pages we find these two sentences:—"She knew that in the cabin they could not possibly remain alone for any length of time, particularly when blowing such a gale." "The *Pathfinder* was anything but a first-rate vessel, and, having all the portholes closed on account of the inclemency of the weather, the atmosphere in it was so close," &c., &c. We don't quite know which of these two sights we should prefer to see, a pair of lovers blowing a gale, or an atmosphere with portholes.

When a young woman who thinks she is plain, but isn't, sits about in gardens disconsolately clad in shabby dresses, and is haunted by a bewilderingly beautiful captain who apparently chaffs and teases her, but really regards her with helpless adoration—when she has an unappreciative brother and a beautiful but diabolical sister, and is plotted against in a Macchiavellian manner that so she may marry a wealthy suitor, and tells the whole story in the present tense—do we seem to have heard something not dissimilar before? It is to be feared that we do. There is, however, in *A Woman Scorned* a lunatic of large property who goes about the country with performing dogs and birds, and is at any rate new in this conjunction. Also, the wicked sister is eaten up of dogs—a catastrophe which has not been as much used in novels as its undoubted effect and the suggestive precedents of Actæon and Jezebel might seem to render likely. There is really not much more to say about the book, except that it will not take long to read, and will be found tolerably interesting—according to the degree and measure of its interest—in the reading.

The *Mystery of Orleton Manor* is a book of a class which has not been common of late years. The author apologises very humbly for his work in a rather superfluous preface—superfluous, because, in the first place, no amount of apology

will atone for the production of a bad book; and, in the second place, because the book is quite good enough to do without any apology. It tells how Thomas Burton was kidnapped in extreme youth by the once-usual gipsy, and went through various vicissitudes in a manner formerly well known to us. But, though there are passages which will remind many people of *Oliver Twist*, and other passages which will remind a few of *The Fool of Quality*, it would be a hasty person who should charge Mr. Jewell with excessive imitation. There is a certain amount of awkwardness inseparable from the first flapping of any wings, and beyond this amount we do not think that he goes. For his good we may remark that the book is inordinately long; that, as the hero knew his name and whence he came, it is very strange that his many benevolent friends did not take the simple and obvious steps necessary for restoring him to his sorrowing uncle; and that the Samaritan chimney-sweeper, Mr. Maggs, and his family are perilous characters. We say perilous advisedly, for though they have imperilled they have not wrecked *Orleton Manor*. But the truth is that the general form and design of the book is one which does not at present command public attention, and it would probably be worth Mr. Jewell's while to turn his thoughts to some other style. His characters are human beings though of a somewhat antiquated type, and this is always something. GEORGE SAINTSBURY.

RECENT VERSE.

Clarel: a Poem and Pilgrimage in the Holy Land. By Herman Melville. (New York: G. P. Putnam's Sons.) These volumes are thoroughly described in their title. An American traveller in the Holy Land, full of Western thought, formed by modern civilisation, wanders among Eastern shrines where dawned a faith which seems now dying, now possessed of a strange vitality: at one time changeless, at another capable of adapting itself to every age and time. The traveller falls in with companions in his journey and makes new friends, nor is a more tender element wholly wanting. The scenes of the pilgrimage, the varying thoughts and emotions called up by them, are carefully described, and the result is a book of very great interest, and poetry of no mean order. The form is subordinate to the matter, and a rugged inattention to niceties of rhyme and metre here and there seems rather deliberate than careless. In this, in the musical verse where the writer chooses to be musical, in the subtle blending of old and new thought, in the unexpected turns of argument, and in the hidden connexion between things outwardly separate, Mr. Melville reminds us of A. H. Clough. He probably represents one phase of American thought as truly as Clough did one side of the Oxford of his day. The following lines on the Holy Sepulchre are striking:—

"In Crete they claimed the tomb of Jove,
In glen o'er which his eagles soar;
But through a peopled town ye rove
To Christ's low tomb, where, nigh the door,
Settles the dove. So much the more
The contrast stamps the human God
Who dwelt among us, made abode
With us, and was of woman born;
Partook our bread and thought no scorn
To share the humblest, homeliest hearth,
Shared all of man except the sin and mirth."

—Vol. i., p. 16.

We must make room for one more quotation,

which is typical of the tone and spirit as well as the poetry of the whole:—

"He espied
Upon the mountain humbly kneeling
Those shepherds twain, while morning tide
Rolled o'er the hills with golden healing.
It was a rock they kneeled upon,
Convenient for their rite avowed—
Kneeled and their turbaned foreheads bowed—
Bowed over till they kissed the stone:
Each shaggy surcoat heedful spread
For rug such as in mosque is laid.
About the ledge's favoured hem
Mild fed their sheep enringing them,
While facing as by second sight
Toward Mecca they direct the rite.
'Look; and their backs on Bethlehem turned,'
Cried Rolfe. The priest then, who discerned
The drift, replied 'Yes, for they pray
To Allah.' Well, and what of that?
Christ listens standing in heaven's gate,
Benignant listens, nor doth stay
Upon a syllable in creed,
Vowels and consonants indeed."

—Vol. ii., p. 477.

We advise our readers to study this interesting poem, which deserves more attention than we fear it is likely to gain in an age which craves for smooth, short, lyric song, and is impatient for the most part of what is philosophic or didactic.

Greenwood's Farewell, and other Poems. By the Earl of Southesk, K.T. (Strahan and Co.) Lord Southesk possesses one, though it is perhaps the lowest, characteristic of a poet—he is good at mere rhymes. He ends a line with a word which seems as if it must be difficult to match without a sense of effort, and yet when the rhyme comes it is perfectly natural and satisfactory. But there our praise must end. Balderdash, vulgarity, and a coarseness which transcends mere vulgarity, struggle for the mastery throughout the volume. An old gamekeeper is dying, and the parson comes to visit him. The daughter is crying, and says the gamekeeper:—

"My child, I doubt
This poor old flickering taper
Is soon to be put out.
It matters not what moment
The fateful snuffers fall,
Last hours are not for woe meant,
But for good-byes to all.
'Ah!' said the parson, 'truly,
Prolonged last hours afford,
To those that use them duly,
Much cause to praise the Lord.'"

There is a poem called "Pigworm and Dixie," the gross vulgarity of which deserves the strongest condemnation. Lord Southesk may tell us he is writing dramatically; but he has no more right to introduce such characters and such phrases than a stage-writer would have to introduce the loathsome orgies of a Ratchiffe Highway publichouse into his play. There are some lines called "Necromancy," which begin thus:—

"Come!—Come!—Come!
From the depths of the sea,
Numb—numb—numb
And cold though you be."

Lord Southesk can call spirits from the vasty deep, but would they come when he called for them thus? He has not the excuse of youth, nor should he yet be in his dotage, but is of an age to know better than to write stuff like this.

Poems by John Moultrie. With Memoir by the Rev. Prebendary Coleridge. (London: Macmillan and Co.; Rugby: W. Billington.) Mr. Moultrie was one of those youthful poets whose after-performances never realised their early promise. While still an Eton boy he had written, not only "My Brother's Grave," the pathetic lines by which he is best known, but "Godiva," "Maimoune," and several other poems, which were contributed to *The Etonian* by him, and show metrical and intellectual power far in advance of his years. He was then, however, in the imitative stage, and

his verses were consciously modelled on "Beppo" and the writings of John Hookham Frere. In after life, and when he gained a style of his own, he wrote much that was graceful and little that was excellent. His more vigorous poems, "The Black Fence," and "St. Mary, the Virgin and the Wife," arose out of a local controversy with Rome, when Captain Hibbert became a convert to Roman Catholicism, and built a chapel at Rugby, of which parish Mr. Moultrie was rector. In his long life Mr. Moultrie made many friends, and this collected edition of his poems is a fitting tribute to his memory. It is printed at Rugby in type somewhat distressingly small, and Mr. Derwent Coleridge's memoir is carelessly written or corrected—as when he calls William Giffard Cookesley, a name well-known to all Etonians, the Rev. George Cookesley. The memoir is egotistic and over-laudatory.

Haileybury Verses. Selected and arranged by Two Cantabs. (Cambridge: W. Metcalfe and Sons.) A reader of Mr. Moultrie might well be tempted to become *laudator temporis acti*; so great is the gulf between the poets in *The Etonian*, and those of the magazine to which, as it would seem, these verses were contributed. The collection may no doubt be valued by old Haileybury boys as a memorial of their literary aspirations, but none rise above, while most are beneath, mediocrity.

Verses from the "Harvard Advocate." (New York: Hurd and Houghton.) America is so rich in minor poets who have written extremely graceful lyrics even when they have given us no great poem of sustained effort, that we have read this volume with considerable surprise at finding how feeble and even bad are its contents. They are selected from twenty volumes of the *Harvard Advocate*, and only one, called "Soupir," has fancy, or melody, or any other lyric virtue. The following stanzas, however, have real merit:—

"A watery waste where the wind is blowing;
A cold wind blowing in sobs and sighs;
A strip of sand, with dry grass growing—
Above, night falling from leaden skies.
Two, but two, on the sand-strip straying,
Pacing its limits up and down;
Loath to linger, but still delaying,
Dreading return to the fading town.

A ship sails out of the harbour slowly,
With a silent watcher standing astern;
A kerchief waves from a cottage lowly—
Ah, God! the lessons we all must learn."

Out of the Silence, and other Verses. By John Bower. (Kelso: J. and J. H. Rutherford.) The 165 pages of this book are occupied by a great number of small poems chiefly lyrical. Few, though some, are utterly bad, but no single one is worth quoting, or was worth printing.

Labda and other Poems. By J. M. Joy. (George Bell and Sons.) Mr. Joy also has written poems whose miserable mediocrity is best expressed by saying as little as possible about them. The excellent workmanship of the Chiswick Press is surely thrown away on books like these.

Alexander the Great: a Poem. By Joseph Mead. (Elliot Stock.) Mr. Joseph Mead, who has written also a poem on the Creation, wonders "that no Teutonic language possesses an Alexanderiad." He therefore supplies it, as, all things considered, he thinks it an integral part of our literature. He has done so in twelve books, consisting in all of some 19,000 lines in which careful investigation has not enabled us to discover one that is good. The opening verses are a fair specimen of the style:—

"The Eagle Milton Himalays flew o'er,
Up Andes Scott the Condor took his soar;
The Dove let Tennyson with dulcet coo
From Apennines all Musa's strains renew;
But some Aornos hill in Greece I ask
In whose infusing sheen to dream and bask."

Leaves of Hope and Phases of Love. Early Poems. By Stanley Savill. (Provost and Co.) Mr. Savill tells us in his preface just what we are to expect. He says that the contents of his book "may rightly be considered crude and unfinished," that they are "the hasty effusions of very early youth." He craves "the lenity of critics on the plea of youth and inexperience," and "earnestly begs that they may be allowed to die—if die they must—in peace." Without discussing how far such plea is worth any heed, we will only try, like the gardener who finds a dying worm wriggling on the garden path, and gives it in mercy a chop with his spade, to aid in putting these verses out of their misery. This is his notion of an appropriate metaphor:—

"Sad, beautiful, beleaguered Paris lay,
Her beauty basking 'neath the moon,
Her chain of bristling bolts gleams far away,
Like surf around a calm lagoon."

And into the following doggerel he translates some of the most solemn words in the Gospels:—

"Could not ye, said he, watch with me one hour?
The soul is willing but the flesh is weak;
Divine grace, therefore, 'gainst temptation seek,
And lest ye be surprised, watch and pray."

St. Thomas of Canterbury: a Dramatic Poem. By Aubrey de Vere. (Henry S. King and Co.) Like Mr. Tennyson's *Queen Mary*, *St. Thomas of Canterbury* is a drama written with intent to reverse the verdict of history, but we think that Mr. de Vere mistakes the opinion of England in considering that it is averse to Becket. Very many who are far from being Catholic in faith or sympathy yet believe that Becket, representing the Church, stood between the people and the tyranny of a monarch who, but for the Church, would have been almost absolute. Mr. de Vere's drama may first be described negatively. It does not read like a modern historian done into verse, and the title shows that, were a theatre-manager never so rash, the author does not think of producing it on the stage. Next, positively, it is interesting throughout, and, though it never rises to great poetic height, is always melodious and careful in versification. It is plainly the work of one who though Catholic is liberal, and is a scholar and a gentleman.

Vagrant Verses, and a Play. By George Staunton Brodie. (Tinsley Brothers.) Mr. Brodie says of these verses, in a prefatory sonnet:—

"Children of Fancy, favoured of the few,
Enough for me some hearts will welcome you."

As we are not among the few, we are glad to think he can dispense with our praise.

London Lyrics. By Frederick Locker. A New Edition, Enlarged and finally Revised. (Henry S. King and Co.) Mr. Locker's poems have been so long before the world that they scarcely need a word from us. They are sportive and humorous without a tinge of vulgarity, which is saying much. They show tender as well as pleasant thought, graceful fancy, and a smooth facility of verse. The present edition has some new poems, which have appeared, we think, in various periodicals; one to the writer's baby is specially happy.

Joan of Arc. (Kerby and Endean.) The author, who withholds his name, tells us, both on the title-page and in the preface, that his poem did not obtain the Vice-Chancellor's Prize in Dublin University. The announcement is surely superfluous; we imagine that the only readers have been and will be those who have had to adjudicate on or to criticise it.

Sketch of the Life and Writings of Ferdusi. (Williams and Norgate.) This little book, which bears only the initials S. R., is extremely interesting. It is illustrated by translations of specimens of the chief poems, with a *précis* of the whole, which serves to connect the fragments. These are, as far as we can judge, well executed, and the book is just what was wanted to give to general readers some idea of a Persian poet whose name

is on the tongues of so many, but of whom little is known except by a few Oriental scholars.

The Song of the Bell. The Gods of Greece and other Ballads. Paraphrased from Schiller by Arthur Mills, M.P. (Bickers and Son.) Mr. Mills has "attempted to render in English the general meaning," &c., &c. He has not succeeded in the attempt.

Song-Mead. By F. Scarlett Potter. (Provost and Co.) These poems are for the most part from the Norse mythology. Mr. Arnold has shown how well such stories adapt themselves to modern verse, and it is, we therefore conclude, the fault or the misfortune of Mr. Potter, and not of his subject, that his verses are so terribly dull and uninteresting.

A Legend of Poitiers. (Provost and Co.) A poem of some 2,700 lines, written mainly in the metres chosen by Sir Walter Scott, but without any of his fire, force, or narrative-power, will not attract many readers. Those who adventure on it for friendship's sake will find it an innocent tale in fluent verse, of which, when they have read, they will immediately and conveniently forget every line. It is as smooth and as insipid as barley gruel.

The Old Palace, with other Poems. By Lady Charlotte Blount. (Chapman and Hall.) Lady Charlotte Blount calls up before her in verse the aspect of Kensington Palace, peopled with the worthies or unworthies of former courts—William III., Queen Caroline of Brunswick, Talleyrand, Princess Lieven, &c., &c. The portrait of this lady will at once show Lady Charlotte's taste and poetic skill. She is described as "the post of secret spy content to fill."

"Cold and forbidding in her look and mien,
In form and feature angular and lean.
Such the Ambassadors from Russia sent
To Britain's court, and better none could be
Selected that great power to represent—
A seeming friend and subtle foe is she.
Pond'ring o'er animals of every kind,
The stealthy weasel Lieven brings to mind."

We need scarcely quote further to sustain our assertion that the book is not worth the paper on which it is printed.

Anglo-Indian Prize Poems. (Hamilton, Adams, and Co.) This is an extremely comical book. The prizes were offered by the "Proprietor of the Crown Perfumery Company of London;" the subject was "the Commemoration of the Visit of his Royal Highness the Prince of Wales to India;" the result was one hundred and fifty poems written in all sorts of languages, and by all sorts of persons; perhaps also a useful advertisement for the Crown Perfumery Company of London. Spirits, of which, we presume, the Company's perfumes are made, are sometimes good detergents. If the Prince makes plentiful purchases they may remove some of the butter which has been spattered on him by the prize-takers. How to make the best of a bad job has seldom been more excellently exemplified than by these Telugu, Hindi, Tamil, and other writers. For instance, we believe that in India it was hard to speak without a smile of the presents dispensed by the royal traveller. But the Telugu laureate is equal to the occasion:—

"In ancient times, kings scattered coins and wealth
around them uselessly, so as to create great confusion
among the crowds assembled to view them.

"To avoid the blame of wasting the wealth of the
God of riches, the Prince (in conformity with the
spirit of modern refinement and civilisation) has
abandoned that custom, feasting his eyes with the
presence of rich men."

Another poet, who writes in Hindustani, has discovered intellectual qualities in his Royal Highness which have remained undiscovered in England even by the affectionate partiality of his tutors:—

"Were he to exercise his powers of reasoning Aristotle himself would be bewildered."

"Clouds pass swiftly the moon. If his intellect had not harrowed them they would have fled more swift, as if the predicate Major had passed to the subject Minor—there being no consequence of the first figure.

"Now that the Prince has come, no flower complains of the flower-gatherer; the bird is not afraid of the fowler's net, and the candle is in love with the snuffers!"

It is certainly one of the hard fates of modern royalty that Princes are forced to open an aquarium without water or fish, and help to advertise cosmetics and scents. But the book is as funny as *Punch*, or the original advertisements of Messrs. Moses and Son.

Exotica. By George Macdonald. (Strahan and Co.) In this elegant volume Dr. Macdonald has collected the translations on which he has been at work for years. They comprise the spiritual songs of Novalis, the Hymn Book of Luther, shorter pieces from Schiller, Goethe, Uhland, Heine and Claudius, and some of the Italian sonnets of Milton and Petrarch. The author tells us that he has expended twice as much labour over the hymns of Novalis as over the rest of the book together. It is by this section of it, therefore, that he would probably wish to be judged. We have never been able to concede that these latest blossoms of the muse of Hardenberg were comparable for music and poetic passion with his earlier and more secular pieces. It is in such matchless lyrics as "Sind wir nicht geplagte Wesen" and "Was past, das muss sich runden," with their delicious infatuation, tender mystical melody and distinctly morbid sensibility, that we hear the real voice of the lyrist of the Blue Flower. When the death of his first child-love had wounded him, and the passing away of that maturer love in which his romantic theories of pre-existence saw all the qualities of the first had finally shattered him, he was glad to take refuge in the mercies of that serene piety which was so calmly ruling in the little family at Weissenfels. Here the sick and mournful soul of the sweetest of mystics rocked itself to rest to the music of these spiritual songs, which Dr. Macdonald has translated with considerable grace and fidelity. It would not be honest if we praised his versions more than this. We miss the harmonious flow of the original, the flavour of melancholy, the entire bloom of poetical distinction, and without these qualities it seems hardly worth while to present us with the rest in however accurate a form. It may be, however, that our readers may not endorse this opinion, and we quote, for their judgment, one of the hymns entire:—

"When in hours of fear and failing,
All but quite our heart despairs;
When, with sickness driven to wailing,
Anguish at our bosom tears;
Then our loved ones we remember;
All their grief and trouble rue;
And the clouds of our December
Let no beam of hope shine through.
Oh, but then God bends him o'er us!
Then his love grows very clear;
Long we heavenward then—before us
Lo, his angel standing near!
Fresh the cup of life he reaches;
Whispers courage, comfort new;
Nor in vain our prayer beseeches
Rest for the beloved too."

Of the version of Luther's Song-Book, the translator says that he has succeeded if we find it rugged. We may congratulate him on an extraordinary success, for we never read anything harsher. It is a question, however, whether to write

"Now let us pray to the Holy Ghost
For the true faith, of all things the most,
That he take care of us when we are dying,
And are going home from this vale of crying,"
and to rhyme *thanked* with *granted*, and, worse still, *schism* with *besom*, is a legitimate imitation of a rude style, or merely perverse eccentricity. The Italian sonnets are, on the contrary, very

elegantly rendered, and remind us of the author in his forgotten early days, when he wrote "Phantastes" and was still a poet. Considering what Dr. Macdonald's work used to be, we cannot but regard this volume as a melancholy failure.

Lays of Ind. By Aliph Cheem. New edition, enlarged. (Bombay.) "Aliph Cheem" is not without a certain smartness of humour, but he is, unfortunately, a very indifferent versifier. Occasionally, as in the "Tank Tragedy," the feebleness of treatment produces a grotesque effect of blundering impropriety.

The Human Tragedy. By Alfred Austin. (Blackwood.) This is the complete form of a poem the several parts of which have already been discussed in our columns.

We have also received *Lays from Latin Lyres*. By F. H. Hummel and A. A. Brodribb. (Longmans.) *As Life Itself*. By Mrs. Frank Snood. (Smith, Elder and Co.) *Otho's Death-Wager*. By Henry Spicer. (Henry S. King and Co.) *Dmitri, a Dramatic Sketch*. By Major-General G. G. Alexander. (Longmans.) *The King's Sacrifice, and other Poems*. (Smith, Elder and Co.) *Elfinella; Lord and Lady Russell*. Plays by Ross Neil. (Ellis and White.) *Poetic Wit*. By Alfred W. Cole, R. B. Brough, and others. (J. Blackwood.)

NOTES AND NEWS.

THE following is a complete list of the Oriental scholars who have promised to contribute to the *Sacred Books of the East*, edited by Prof. Max Müller:—Dr. Bühler, Mr. Burnell, Prof. Cowell, Prof. Eggeeling, Dr. Jolly, Prof. Kielhorn, Dr. Legge, Prof. Pischel, Rajendralal Mitra, Prof. Thibaut, Mr. West.

THE excellent French translation of Prof. Max Müller's *Lectures on the Science of Language*, by Messrs. G. Perrot and Harris, has just been published in a third edition.

WE understand that an illustrated edition of Dr. Farrar's *Life of Christ* will shortly be published by Messrs. Cassell, Petter and Galpin in serial form. The illustrations of places and customs and habits of the people will be taken from photographs by Mr. F. Mason Good (well known for his artistic reproductions of Eastern scenes), who visited the Holy Land for the express purpose of this work. The copies of coins, medals, and antiquities will be produced under the superintendence of the Rev. S. S. Lewis, of Corpus Christi College, Cambridge.

THE October number of the *Popular Science Review* will contain Prof. Tyndall's paper on the "Parallel Roads of Glen Roy," illustrated with a map and woodcuts.

THE new and corrected editions of Dr. Andrew Wynter's works, *Our Social Bees and Curiosities of Civilisation*, which he had just completed at the time of his death, will be issued in October.

A CONFERENCE of American librarians is to be held at Philadelphia on October 4-6.

THE New York *Nation* announces a forthcoming *Memoir of Lieut.-Col. Tench Tilghman*, an eminent patriot of the Revolution, the *aide-de-camp* and secretary of General Washington. An appendix will contain his private journal of the treaty at German Flats, N.Y., between the Commissioners of Congress and the Six Nations; his diary of the siege of Yorktown; a number of his letters to his father from army head-quarters, 1776-1781; and several of Washington's letters to him never before published.

MESSRS. W. AND R. CHAMBERS have in preparation an *Elementary Manual of Animal Physiology*, by Dr. John G. McKendrick.

A RETURN just issued by the authorities of the British Museum will be found very useful for reference in questions regarding the Government

expenditure on objects of literary and scientific interest. In 1873-4, we learn, the sum spent on manuscripts was 3,074*l.*, and on printed books 9,906*l.*; the year following, the respective sums were 2,948*l.* and 10,201*l.* On antiquities, coins, and medals, including amounts expended on the excavations at Ephesus, 32,822*l.* was spent in 1873-4; a year later the sum only reached 7,233*l.* On prints and drawings the outlay for the two years was 2,521*l.* and 2,724*l.* The cost of new specimens for the Zoological Department reached 1,625*l.* in 1873-4, and 1,344*l.* in 1874-5; for the Botanical Department the amounts were 375*l.* and 405*l.*

AMONG the volumes added to the Manuscript Department of the British Museum since the beginning of the present year the following will be found well worthy of notice:—Cases of Right of Election determined by the House of Commons, 1660-1729; Copy of the Poll-Book for Bedfordshire, Sept. 1, 1727; Correspondence of the family of Swynfen, seventeenth century, and of the family of Jervis, co. Stafford, seventeenth and eighteenth centuries; Correspondence of Mrs. Ricketts and Admiral Sir John Jervis, Earl St. Vincent, 1765-1844; Memorandum Book of Expenses, &c., of Capt. Jervis, afterwards Earl St. Vincent, 1775-1777; a Collection of Poems, Epigrams, &c., from MS. and printed sources, made about 1713; Note-Book of Correspondence of the Agent of the English Factory at Lisbon, relating to the Wine Trade, 1793-1800; Architectural Drawings, Plans of Cathedrals and other Churches, Copies of Monuments, &c., in England, by John Carter, contained in twenty volumes; List of Plays performed at Drury Lane Theatre, 1766-1798, with Notes by Miss Pope; Account Books of Covent Garden Theatre, 1789-1809; Original Letters of Lord Norbury, Dean Hook, and Dr. Barton, Warden of Winchester; Cantatas, Arias, &c., by Benedetto Marcello, Baffi, and other Italian composers; Minutes of Proceedings of the Royal Lodge of Freemasons, London, 1777-1817; Dr. Geo. Milligen Johnston's "Short Description of South Carolina," 1763; Account of Proceedings of the Rebels there, 1775; and Tour in Flanders, 1776; Correspondence of the Family of Pitt of Blandford; and chiefly of Sir William Pitt, Teller of the Exchequer, sixteenth and seventeenth centuries; Notes by S. C. Davison of Lectures by Prof. F. H. W. Gesenius on Genesis, at Wittenberg, 1841-1842; and by Prof. F. A. G. Tholuck at Halle; Political Poems of the Years 1714-1716; Tables of the Gross and Net Produce of the Customs, 1710-1763, a richly-bound volume, with the royal arms; Letters of Sir David Wilkie to Perry Nursey, of Yarmouth, 1814-1824; Memoranda Books, Letters, &c., of the Chevalier d'Eon while in England; Copies of Despatches of Frederic Bonnet, Prussian Ambassador in England, 1696-1699, in four volumes; Visitors' Book of the Farm of Tiptree Hall, 1846-1869; a Collection of Ancient Madrigals by W. Clark, in six volumes; Original Letters of A. F. Kollmann to Dr. Calcott, 1798-1806; Diary of the Siege of Gibraltar, from July 1, 1779, to Feb. 20, 1783, in Spanish; Minutes of the Treasury Board relating to Steam Navigation to India, 1834; Proceedings of Commissioners to settle Disputes between the English and Dutch East India Companies, 1621, 1622; Life and Death of Prince Henry, by John Hawkins (printed under the name of Sir Charles Cornwallis), seventeenth century; a commonplace Book on subjects of Religion and Morals, seventeenth century; Presentation of Persons concerned in the Duke of Monmouth's Rebellion, 1685.

THE *Nation* for August 3 gives the following statistics of the American newspaper press in 1776 and 1876:—

"Upon a single page at the end of the catalogue of the exhibit of the Newspaper Pavilion in the Centennial Exhibition is a 'complete directory' or

bibliographical list of the newspapers published in the thirteen colonies one hundred years ago. Few things so force into sight the enormous physical growth of the United States as a comparison of this page and its little list of 37 papers with the preceding 153 pages cataloguing the 8,129 newspapers published and on file now in the Pavilion. In 1776, New York had 4 newspapers, Massachusetts 7, and Pennsylvania 9; in 1876, New York has 1,088 newspapers, Massachusetts 346, and Pennsylvania 738, while five States unknown in 1776 surpass Massachusetts in 1876—viz., Illinois with 707 newspapers, Ohio with 568, Iowa with 401, Missouri with 378, and Indiana with 375. Thirty-six of the newspapers of the Revolutionary days were weeklies; the sole exception, the *Pennsylvania Evening Post*, was published three times a week. There was no daily newspaper then in this country: there are now 716; but the weeklies still hold their own, numbering 6,139, or more than eight times as many as the dailies."

THE *Revue des Deux Mondes* for August 1 contains the commencement of an essay by M. Vacherot, approving with some further attenuation of M. Janet's already attenuated defence of Final Causes; and a very amusing burlesque novel, by M. M. Achard, entitled "Mon oncle Barbassou." The instalment of M. Anatole Leroy-Beaulieu's work on Russia deals with the peasants and the results of emancipation in a spirit of sober optimism.

BESIDE the very stately, generous, and penetrating article on Lord Macaulay in the *Quarterly Review* for July, which reached us too late for adequate notice, we may call attention to an energetic vindication of Croker from the attacks of Macaulay and his biographer, and to a well-considered little paper on South Sea Islands Mythology, based upon Mr. Gill's book.

THE *Cosmopolitan Critic and Controversialist* is apparently intended to be the organ of the numerous class who feel as if they had something to say and who have nowhere to say it. Most of the articles are sensible, but rather disfigured by a pretentious liveliness; perhaps the best are one on "The Unseen Universe," from the point of view which finds traditional supernaturalism more credible as it stands, and one on University Reform, which states the obstructive argument fluently and effectively. Two articles on Middle-Class Education, and Lady Helps and Labour and Education, repeat thoughts which will bear repetition, though they have been more effectively put in *Fraser*.

THE following Parliamentary Papers have lately been published:—Papers relating to H. M.'s Colonial Possessions, Part III. of 1875 (price 1s. 7d.); Annual Report of Captain Harris on the Operation of the Contagious Diseases Act (price 4d.); General Digest of Endowed Charities for the East Riding, co. York (price 9d.); Return of Persons Irregularly Admitted to the Service of the Post Office (price 10d.); Twentieth Report of the Commissioners of H. M.'s Customs (price 10d.); Correspondence respecting the Attitude of the State towards the Fine Arts in Great Britain and the various Foreign Countries of Europe (price 4d.); Report from the Select Committee on the Toll Bridges Bill (price 3d.); North America: Correspondence respecting the Extradition of Bennet G. Burley (price 4½d.); Further Correspondence respecting Extradition (price 3½d.); Forty-Fourth Report of Commissioners of Public Works in Ireland (price 4s. 9d.); Report of the Fishery Board Commissioners, Scotland (price 4d.); Correspondence respecting the Colony of Fiji (price 7d.); Annual Report of the Veterinary Department of the Privy Council Office (price 1s. 6d.); The Twenty-Fifth Report of the District, Criminal, and Private Lunatic Asylums in Ireland (price 7½d.); Report of Committee on Railway Passenger Duty (price 3s. 6d.); Summary of the Returns of Owners of Land (price 4d.); Correspondence respecting Commercial Negotiations with Portugal (price 11d.); Further Papers and Correspondence relating to the Arctic Expedition

(price 3½d.); Railway Returns for United Kingdom, 1875 (price 1s. 2d.); Memorandum by the Deputy Keeper of the Public Records on the Destruction of Useless Documents now preserved in the Public Record Office (price 1½d.); Annual Report of the Local Government Board for Ireland (price 2s.); Further Correspondence respecting the Determination of the Boundary between Canada and the United States (price 2d.); Report of the Committee of Council on Education, England and Wales, Part V. of Appendix (price 1s. 6d.); Finance Accounts for Year ended March 31, 1876 (price 10d.); Statistical Abstract for the United Kingdom from 1861 to 1875 (price 9d.); Report of the Royal Commission on Fugitive Slaves (price 3s. 6d.); Correspondence in reference to certain Grievances complained of by the Nobility of Malta (price 3d.); Thirtieth Report of the Commissioners in Lunacy (price 2s. 3d.).

WE have received *The Discipline of Drink*, by the Rev. T. E. Bridgett (Burns and Oates); *The Errors of Homoeopathy*, by Dr. Barr Meadows, third edition (Hill); *Through Norway with a Knapsack*, by W. Mattieu Williams, new and improved edition (Stanford); *Buy the Truth*, by Thomas Rain (Watts); *Britannia's Sultors: Part I. The Banquet* (Stanford); *Traité de Droit Français privé et public*, par A. Moullart (Paris: Guillaumin); *The Tree-Lifter: or, a New Method of Transplanting Forest Trees*, by Colonel George Greenwood, third edition (Longmans).

EDWARD WILLIAM LANE.

THE world has lost an English scholar whom even Germany acknowledged to be the unapproachable master of his subject. On August 10, Mr. Lane, the Orientalist, closed a long career of uninterrupted work.

Born at Hereford September 17, 1801, Edward William Lane was the third son of the Rev. Theophilus Lane, LL.D., and Sophia his wife, daughter of Richard Gardiner, of Sudbury in Suffolk, and niece of Gainsborough the painter. Left by the sudden death of his father in 1814 to the guardianship of his mother, a woman of a character at once strong and fine, his early years were passed at the Grammar Schools of Bath and Hereford. In due course, with the object of taking orders, he went to Cambridge, but conceiving a dislike to college life as he found it, and having practically satisfied himself by means of the examination papers that he was able to take high mathematical honours, he came to London, and studied engraving. The taste inherited from Gainsborough's favourite niece, who often described to her family a girlhood very much passed in the artist's studio, did not, however, finally determine his career. He acquired that delicacy of pencil that equally characterised his brother, Richard Lane, and then left art to follow the pursuit of his life. At this time Egypt had become open to European travellers, and their discoveries had been rendered of tenfold interest by the newly-found key to the hieroglyphic inscriptions. Anxious to enter this new field, Mr. Lane, in 1825, sailed for Alexandria.

This first visit to Egypt, 1825 to 1828, was devoted to the study of Arabic, ancient and modern, and to the examination of the monuments of that country and Lower Nubia. During this period Mr. Lane laboured with such assiduity and success that he brought back with him a description of Egypt and Lower Nubia, and upwards of a hundred drawings in sepia, besides many sketches. That this work has never been published, on account of the cost of illustrating it, is to be deplored, as it contains the only clear and accurate account of the monuments of Egypt, written with the same plain fidelity and faculty of saying everything that ought to be told as characterises the *Modern Egyptians*. The drawings are of singular beauty, with a delicacy of tone and a fineness of detail that has been rarely equalled. Executed by

the camera lucida, they have the accuracy of photographs without their violence to the effects of light. In course of time part of this work, describing the manners of the modern inhabitants, was shown to Lord Brougham, who at once saw that it might be expanded into a book of great interest, and it was at his suggestion that the Society for the Diffusion of Useful Knowledge commissioned Mr. Lane to carry out this idea. He never completed work except on the spot; and therefore, on accepting this offer, he at once, in 1833, again visited Egypt, and in Cairo itself, an Arab city as yet untouched by Western influences, he wrote the work by which he is best known in England. The stay in Cairo was only varied by a visit to Thebes rendered necessary by the severe plague of 1835, when Mr. Lane took the opportunity of again studying the ancient monuments for his manuscript description of the country.

After his return to England in 1835, he published, in the year following, the *Account of the Manners and Customs of the Modern Egyptians*, of which a sixth edition appeared quite lately. It need only be said that this work remains unrivalled in its class. Mr. Lane's next work, published during the years 1838 to 1840, was his translation of the *Thousand and one Nights*, the first scholarly rendering of the Arabian tales. Besides the Oriental colouring of this version, it is enriched with notes, each of which is a compact essay dealing with a leading characteristic of Arab manners and thought. In the year in which this work was completed, Mr. Lane married a Greek lady, and not long afterwards lost his mother, to whom he had always shown the most devoted affection.

During his first visit to Egypt Mr. Lane had formed a friendship with Lord Prudhoe, afterwards fourth Duke of Northumberland, which was destined to influence his after life. To him the scholar had confided his project of composing an Arabic-English Lexicon, and in consequence another visit to Egypt was proposed in order to carry it into execution. In consequence Mr. Lane once more left England in 1842, on this occasion accompanied by his wife, his sister (Mrs. Poole), and her two sons. On his arrival at Cairo he at once began with his friend, M. Fulgence Fresnel, to examine the materials for the work. He had hoped that M. Fresnel would have aided him, but, in failing health, that eminent Arabic scholar regretted that his strength could not do what his friendship wished. Mr. Lane, therefore, undertook his labour single-handed, aided only by a sheikh for copying. The enterprise was at once found to be far greater than he had imagined. In the libraries of the mosques of Cairo, lexicons were discovered more numerous, and in the case of two far larger, than had been expected. Though the mountain to be scaled thus grew in height as it was approached, Mr. Lane with his characteristic resolution attempted its ascent by the hardest route. He wished to do something final for science. Accordingly, instead of writing a Lexicon on his own judgment, he wrote one founded on the Arab materials, composing each article from many manuscripts and adding to every signification the initials of the native source. His own opinion was sometimes given, modestly enclosed in brackets. To accomplish his work he laboured in Egypt not less than twelve hours a day, resting only on Sundays. He found time, however, to supervise his nephews' education and give their studies a distinct object.

The materials for the *Lexicon* having been sufficiently collected, Mr. Lane returned to England in 1849, and after a time decided to live at Worthing, as he found its climate suited his delicate health. From that time until the 5th of the present month, when he sent a proof to the printer, Mr. Lane worked at the composition and publication of his *Lexicon*, his labour occupying him from ten to eight hours a day. The first volume of the *Lexicon* appeared in 1863, and was

followed by four others at intervals of two or three years, interrupted in one case by a calamitous fire at the printing-office of Messrs. Watts on the very day of the completion of the fourth volume, by reprinting which two years were lost. The sixth volume is far advanced in the press, and will appear early next year. The whole will be completed from Mr. Lane's manuscript in two more volumes.

Of Mr. Lane's *Arabic Lexicon*, the work by which he is best known on the Continent, it is not possible to give any idea except to Orientalists. To classical scholars it will be surprising that the largest of Arabic lexicons by European writers should not be based on its European predecessors. On the contrary, it is widely antagonistic to them. It is based on native authorities only, with the advantage of Western method. Though the first Arabic lexicon of its kind, it is also the last, for, though many dictionaries may be constructed out of it, nothing in it needs to be done again. The edifice is vast, but every detail is finished with the utmost exactness.

The fourth Duke of Northumberland first encouraged the *Lexicon*, and bore the main cost of its production, and his widow, the present Dowager Duchess, religiously carried on his munificent support. Earl Russell was the first English Minister to give the project official countenance, which ultimately took the form of a pension on the Civil List.

Mr. Lane's private life was that of a learned man. He allowed nothing but the claims of affection to interfere with his work, but his few spare moments endeared him to his family and his friends. His influence in his own circle being that of a noble example was potent, and his sympathies were never narrowed by his almost ascetic life. Public affairs shared with the history of discovery of every kind his warmest interest. A lofty faith and a blameless life added from time to time to the dignity of his form and the nobility of his countenance, in spite of the constant ill-health with which he battled while he did his work. A delicate constitution, enfeebled by severe study, at length gave way, and, notwithstanding the constant and most tender attention of his family, and the unremitting care of his medical adviser, a short illness ended the career of this great scholar.

After the appearance of the first volume of his *Lexicon*, Mr. Lane was unanimously elected a correspondent of the Institute of France in the Académie des Inscriptions et Belles Lettres, and in 1875, at the Tercentenary Festival of the University of Leyden, an honorary degree was conferred upon him.

It would be wrong to end this notice without speaking of Mr. Lane's literary influence in his family, especially over those who were in fact his pupils. His sister, Mrs. Poole, at his suggestion visited the harems of Cairo and wrote the *Englishwoman in Egypt*. His elder nephew, Edward Stanley Poole, became an able Arabic scholar, but his duties in the Department of Science and Art gave little opportunity for public proof of his capabilities in this respect, and the promise shown in his editions of his uncle's works was untimely cut short in 1867. Both Mr. Stanley Poole's sons living with Mr. Lane acquired the same taste for Oriental studies. Mr. Stanley Lane Poole has already produced an Oriental volume in the series of publications of the British Museum, and Mr. Reginald Lane Poole has just published a translation of Prof. Land's *Principles of Hebrew Grammar*. For myself, I owe everything to my uncle. Whatever I have undertaken has been referred to a guardian whose office has only now been laid down. If I have done well, it is his; if ill, my own. May this notice be received indulgently as a weak tribute to the noble heart which beat to the last true to science and to love. Of no man can it be more truly said that he worked, not for gain, nor for honour, but alone for duty and for love.

REG. STUART POOLE.

NOTES OF TRAVEL.

A COMPARISON of the geography of Mr. Stanley's route between the Victoria and Albert Lakes, derived from the last published instalments of his correspondence, with the configuration of the Albert given by Signor Gessi in his sketch-map and descriptions, leads to several important presumptions. First of all, it appears that, if Mr. Stanley's account of Beatrice Gulf is correct, Signor Gessi cannot have seen the southern termination of the lake as he supposed, but must have mistaken a convergence of the surrounding mountains, north of Stanley's high promontory of Usongora, for the closing of the lake, which is now shown to extend at least some miles south of the equator, if not to the enormous distance indicated upon Sir Samuel Baker's maps. Signor Gessi's sketch-map shows no such deep inlet of the eastern shore as that to which the name of Beatrice Gulf has been given by Mr. Stanley, which seems to be part of a southern extension of the lake beyond Gessi's supposed southern shore. It is remarkable also that Signor Gessi, though he indicates several high mountains, obtained no knowledge of the huge snow-clad Gambaragara; had he approached it at all, a landmark of such colossal proportions could not easily have been overlooked. Again, the astronomical position of Unyampaka, the point at which Mr. Stanley touched the shore of the Albert, adds a link to an already existing chain of probabilities that the eastern shore of the lake has been laid down much too far west in the maps prepared to illustrate Sir Samuel Baker's travels, and thence in all others. Stanley says, "our camp on Lake Albert, in Unyampaka, was situated in E. Long. $31^{\circ} 24'$ by observation, and N. Lat. $0^{\circ} 25'$ by account." There is perhaps a slip of the pen here; it is more likely that the latitude was observed, the longitude set down from dead reckoning. However that may be, the observation, if worth anything, brings the eastern coast of the Albert nearly a degree further east, or nearer the Victoria, than it has been hitherto supposed to be. As giving weight to this change it may be noted that the reduction of Sir Samuel Baker's astronomical observations for longitude at Vacovia, his farthest point on the shore of the lake, gave its position as $31^{\circ} 35' E.$, but for some unexplained reason the longitude adopted for this place on his map is $30^{\circ} 52'$; and while Fatiko, farther north, was laid down in $32^{\circ} 4'$ on Sir Samuel Baker's first map, the results of Lieutenant Julian Baker's observations place it more accurately in $32^{\circ} 28' E.$ Thus, the observations made at these three points, on which the remaining geography depends, agree in showing a probability that the Albert Lake has hitherto been placed from half to one degree too far west on our maps. The fact that Signor Gessi has adopted in his map the position and dimensions of the part of the lake shore actually seen by Sir Samuel Baker is of no weight as against this presumption, since Gessi had no means of determining his position, excepting by the rate of travelling by boat.

In his journey southward to Rumanika's capital in Karagwe, Stanley probably followed very much the same line as that taken by Speke and Grant in 1862, and in his latest discoveries, made while travelling along the frontiers of Karagwe, and in exploring the lake chain of the Kagera river, he enlarges, but at the same time confirms, the geography sketched out by Speke from native report. Almost every name in Stanley's description of this region may be found in Speke's map, though the States and kingdoms to which some of these apply—Ruanda, Mpororo, Ankori (Speke's Nkole), Karagwe and Kishakka—acquire much greater definiteness from Mr. Stanley's work.

ADDITIONAL light may soon be expected to be thrown on the Albert Lake, for Mr. Lucas, to whose expedition we have frequently referred,

writing from Lado (Gondokoro) in June, was then about to start with Colonel Gordon for the south end of the Nyanza, with a steamer and boats. Mr. Lucas's latest plan is to continue his journey from the south of the Albert straight across country west and south to Nyangwe on the Congo.

IN continuation of our last account from the Norwegian Exploring Expedition, we hear that it has not been at all favoured by the weather. Since it left Christiansund, June 27, it has met with no less than five storms (wind-velocity forty-five miles an hour)—two in the "Lightning" Channel early in July, one at Thorshaven, one north of Faroe, and one at the Westman Islands (off the south coast of Iceland). It has been only in the short intervals between these storms that any deep-sea work has been done. The last days of June were fine, so the expedition sounded, dredged, and trawled off Christiansund, on the bank called "Storeggen." Here the fauna was quite Atlantic: on the outer edge of the bank the water deepened to 300, 400, and 500 fathoms, and the ice-cold water was met with, yielding an Arctic fauna. Two large specimens of an *Umbellularia* (the same as earlier) were found, with a new starfish and an animal which is quite new to the naturalists on board. Of smaller organisms there were also several new ones. In lat. $63^{\circ} 10' N.$, long. $1^{\circ} 30' W.$, a sounding in 1,050 fathoms gave a temperature under 32° below 300 fathoms. The *Vöringen* had to leave this station to refit, as a sea had carried away the two fore-hatches. The course was shaped for Thorshaven, where the expedition stayed eight days to refit (July 8-15). The stay there was very interesting, especially for the geologists. The formation of caverns at sea-level was an operation visible in all stages of progress. In the Zoolite caverns of Naalis a rich harvest of minerals was secured. The inhabitants of Thorshaven received the expedition very hospitably, and remembered with great pleasure the stay of the *Lightning* and *Porcupine*. After a trip round the main island to Westmanhaven, the *Vöringen* left Faroe July 16, and steered for her last station. Bad weather brought work here to a speedy conclusion; however, a series of temperatures were obtained, indicating ice-cold water at a depth of 300 or 400 fathoms. On the north-eastern corner of the Faroe Bank the depth increases very rapidly. In lat. $63^{\circ} 22' N.$, long. $5^{\circ} 30' W.$, soundings gave 1,180 fathoms. A series of temperatures gave 32.4° in 400 fathoms, 31.8° in 500 fathoms, and the bottom temperature 29.8° . In lat. $63^{\circ} 55' N.$, long. $7^{\circ} 10' W.$, 30.2° in 677 fathoms; in lat. $63^{\circ} 3' N.$, long. $10^{\circ} 15' W.$, 37.2° in 256 fathoms. Further west the bottom temperature was found to be 46.2° . Bad weather prohibited dredging, so the course was laid for Reikiavik, but heavy S.W. winds and sea made the progress very slow. July 22.—Iceland was made in the morning, but in the afternoon the weather got so wild and thick that shelter was sought at the Westman Islands, a group of small islands off the south coast of Iceland. Here a stay of three days was made; during one of them there was a heavy gale, in which steam was kept up. The visit here proved very interesting. The whole of the islands are volcanic: a large old crater, with perpendicular wall 400 to 500 feet high, is visible; one side is standing, the other has been washed away by the sea. Two miles off is a more recent cone, 770 feet above sea-level, in full preservation in a hollow 50 feet deep on top. The base of the cone is lava; the cone itself, whose outline is beautifully geometrical, is composed of loose stones. The sea birds are very numerous, living in the countless hollows in the cliffs, where they were hatching at the time of the visit. Whales, large and small, were about the ship. Westmaney was left July 26, and Reikiavik reached that evening. On the south coast of Iceland the current was very strong to the eastward, and from Cape Skagi to Reikiavik its violence was fearful. The Ice-

landers reported that they have very seldom had so bad a summer as this one—perpetual storm and rain. This has not been favourable to the expedition except as regards meteorology. In this branch hourly observations have been regularly taken when at sea. The expedition was to stay at Reikiavik five or six days for coaling and for magnetic base observations. Hardly any magnetic observations have been obtained at sea, the weather having been so boisterous. It was intended to give up making the circuit of Iceland (the ice on the north side went away in June) and to take up a line south of Iceland, and then straight across to Norway about to Namsa. The scientific staff is very well contented with the results gained, in spite of the bad weather.

PERHAPS we may here most appropriately call attention to a most useful and entertaining little book, published by Messrs. Sampson Low and Co., and entitled *Five Weeks in Greece*, by J. F. Young. It is written by a youthful traveller, who lays no claim to deep classical learning, and professes nothing which he does not perform. He reflects with great freshness and honesty all that he saw and heard, and confesses with much naïveté the sources of his information. Indeed, the whole book, from the dedication to the end, is intensely simple and natural. It will, therefore, be of great service in dispelling the general ignorance about Greece which still prevails among English tourists, and will help to allay the yet lurking apprehension about brigands, for which there has lately been no cause. For those who love the purest air, the most beautiful scenery, the most absolute solitude, the most complete freedom, there is nothing comparable with a ride through Greece, or a cruise about its coasts, even if its splendid history and antiquities were forgotten. It is to be hoped that in a few years a trip to Greece will be as ordinary a thing as a trip to Rome, and the perusal of Mr. Young's book shows how easy a thing it is even now. The author confesses that he did most of his reading on the subject after his return—a clear evidence how useful and stimulating his tour had been, and when he is not too ambitious he illustrates well and to the point. But he is sometimes hazy in his geography, making very odd use of the points of the compass. Modern Athens is not to the west (p. 40) of the Acropolis, nor could the west wind (p. 57) have driven ships from the battle of Salamis to Eleusis, nor is Arachova, on the south side of Parnassus (p. 243), visible from the plain of Orchomenos north of Chaeronea. He repeats the current story about the lion of Chaeronea, for which the writer was taken to task in the ACADEMY by M. Gennadius, and he may expect them to be angry about it at Athens after this correspondence. Indeed, had Mr. Young remembered that English books on Greece are eagerly read at Athens, he would have altered his remarks on p. 85, which are in decidedly bad taste. As Mr. Young describes himself "of Brasenose Coll. Oxford," his tutor might have looked over the following passages. P. 3: "the city [Athens] noted for its hospitality to strangers ('metics,' as they were called)." P. 29: "the marble figures supporting the stage of the theatre are called *bas-reliefs*." P. 39: "to the south [of the Acropolis] extend the *Elysian fields* of the ancients, through which runs Ilissus, &c." P. 42: "the 'asty' or lower city of the ancients." P. 128, note, describes the ancient quoit as thrown with both hands. This does not agree with the posture of the *Discobolus*. He also says (p. 149) that the natives call all travellers "the Lords." This is true in one sense, but so they call all donkey-boys. 'O *kúptos* in modern Greek is simply "the gentleman," or plain Mr., and in Greece everybody is *ó kúptos*. This mistake of Mr. Young's evidently results from the fashion of dosing our undergraduates with the Greek of the New Testament. The perusal of any Athenian newspaper would have set him right. In the passages above quoted we have brought

out the points in italics for briefness' sake. This we mention lest they should be mistaken for Mr. Young's italics, which are already far too numerous through the book. One almost suspects that a friendly school girl, or devoted young sister, must have read the author's proofs, when we find the following gush of emphasis (p. 168): "You must supply the associations; the place itself supplies nothing but the *memory* of antiquity, distorted and obscured by interloping *Mediaevalism*, and represented to-day by *modern* stone houses and one broad street," &c. This is in a description of Thebes; and there is constantly this free use of italics all through. Such faults of form, however, detract but little from a very readable and useful book, which is an excellent guide for those who are contemplating a journey to Greece, and can study history and archaeology elsewhere. The author perhaps has not appreciated Boeotia properly. He speaks of it as foggy and sloppy, whereas the present writer found it (about three weeks before Mr. Young visited it in 1875) a beautiful, richly-watered valley, surrounded by a panorama of mountains, with full streams tumbling down the sides of well-watered Helicon. He regrets bitterly not having seen Arachova, and we can assure him his regrets are well-founded; as it is by far the most interesting place in Greece for those who desire to contemplate the Greek type in its highest beauty.

EXTRACTS FROM SPENCE'S CORRESPONDENCE.

WE have on a former occasion (see ACADEMY, February 20, 1875) given some extracts from the original letters of Joseph Spence, written when abroad, and chiefly addressed to his mother. The few more selections which follow will be found no less characteristic and entertaining. The first of them is dated Lyons, July 30 (August 10), 1731:—

"I ought to let you know the progress of my Dress & by what degrees I creep into the habit of a Gentleman. Ever since we have been at Lyons, my Hair (w^{ch} had six weeks growth on my Forehead & Temples at Dijon) has been com'd back on a light brown natural Wigg. It did not comply so well with y^e Mode at first; but every day my Barber persecutes it with an Ounce of Pomatum; & then plasters it down with half a Pound of Powder. After the operation I walk out with what passes for a Head of Hair very well Frosted. My Coat is a light Camel with Silver Buttons; a Green Silk Wastcoat sufficiently daub'd with silver lace; and I seem upon the brink of having a pair of Stockings to it wth Silver Clocks. With all this I shall look upon myself to be as much a Gentleman, as that half of the Gentlemen in England, who are only so from the Cloaths they wear."

The letter of September in this year, addressed to Henry Rolle, Esq., Member of Parliament, at Stevenston, near Great Torrington, Devon, has the following passage:—

"I shall venture to give you an account of our most entire piece of Antiquity here at Lyons. 'Tis what we call a Tauribole. The most Learned Man in y^e good City is a Jesuite; who has printed an account of it; & to whom I have been introduc'd. There was a particular ceremony of old (he tells me) of making a Priest very terrible & very venerable. A Pit was dug in y^e Earth; y^e Priest went into it; & then it was cover'd with boards, bord full of holes. Over this they kill'd a Bull; so that his blood might fall chiefly on y^e middle of the boards. As it ran thorough, the Priest did his utmost to catch as much of y^e blood as he cou'd on his Robes, his Breast, his Face, in his mouth & in his ears, & when he was well soakt, he came out; walk't majestically thorough the people; & went off sanctify'd, for y^e space of twenty years."

"Florence, Oct. 13, 1732.

"Don Carlos, whose name has been so much mention'd in England of late, went from this place the 6th instant for Parma. I have had the honour of seeing him both at a sett Audience, & at a Rabbit hunting; he was very grave at one and very lively at the other; & I doubt not will make as good a Sovereign, when he comes to be one, as most in Europe."

"Florence, April 21, '32.

"We have here a curiosity of English growth, that I remember to have heard talk'd of ever since I was a child. 'Tis y^e Strong man of Kent, who has liv'd here in y^e Great Duke's pay, above these twenty years. He has show'd often before y^e whole Court; & us'd to make nothing of fixing himself so that four strong horses c'd not stir him out of the posture he had set himself in. He us'd to let them pull & tug & sweat till they were satisfy'd; and then by giving a jerk to y^e Rope by which he held 'em, w'd turn 'em up all four together upon their backs; & leave 'em there sprawling on y^e ground. . . . We have been often mightily diverted with hearing him tell over y^e adventures of his life; which he does with a great deal of honesty & vigour."

"Paris: July 2, 1733.

"Paris is a very agreeable place; and more full of nobility, such as they are, than London; but there's a great deal of difference between a Marquis in England & a Marquis in France. Here to be in possession of such a Mansion House, or such a particular Farm, very often makes all the family Lords; when with us the head of that family wou'd be only a tolerable Lord of a manor. I have often seen the pretty Dutchess of Bourbon, who is one of the three sisters I have talk'd to you of in a former; tho' she's as pretty as an Angel, she's forced to paint here, for there's no being in fashion without it. The Actresses on the Stage and the Ladies of the first quality, in particular, lay on the Red so unmercifully, that in the side boxes they look like a bed of old overblown Piony's."

CORRESPONDENCE.

ASTAKAPRA.

Ragatz, Switzerland: August 11, 1876.

Astakapra is the name of a city in the region about modern Gujerat which appears both in Ptolemy's tables and in the *Periplus* of the Erythraean Sea, and the identification of which is of some importance in the adjustment of the classical geography of India. In the preparation of the map of India for Dr. Smith's *Historical and Classical Atlas*, the present writer, after a good deal of consideration, placed it on the west coast of the Gulf of Cambay, not far below Bhaunagar, where a very ancient site, described by Mr. Burgess in his *Notes on Gujerat*, afforded a fair provisional identification. But I was unable to recover any trace of the Greek name. This is now afforded in a paper on Valabhi inscriptions, by Dr. G. Bühler, in the *Indian Antiquary* for July, which I have just seen.

One of these inscriptions, a copper grant by Dhruvasena I. of Valabhi, confers a certain well and pasture "in the village of Kukkata (situated) in the *Hastakavapra* Aharani" (the last word supposed to be some territorial subdivision), on a Brahman residing at *Hastakavapra*.

Kukkata is identified by Dr. Bühler with the modern Kākād in the Gogo Talukā, and *Hastakavapra* probably with "Hāthab in the Bhaunagar territory, which is held in great esteem by the Bhaunagar Brahmans on account of its temple of Nilkanth," and which is a few miles from Kākād.

I have no maps or other aids where I write, so I will make no further remark. The identification of Hāthab with Hastakavapra may be accepted on Dr. Bühler's judgment: and that which I put forward of Hastakavapra with the Greek Astakapra will hardly be disputed, and I am glad to have made in the Atlas map so near an approximation to the true site. H. YULE.

ASSYRIAN RESEARCH AND THE HISTORIANS.

Queen's College, Oxford: August 15, 1876.

The eminent historical critic, Prof. A. von Gutschmid, has just published a work called *Neue Beiträge zur Geschichte des alten Orients*, which should be studied and meditated upon by all Assyrian scholars. The demolisher of the *Nabathean Agriculture* of Ibn Wahshiya, and of the strange theories that had been built upon it, has now been stirred up by the new edition of Duncker's *History* to come down upon the historical conclusions of the Assyriologists somewhat in the fashion of Byron's Sennacherib, and subject them to a vigorous and unsparing criticism. Whatever Herr von Gutschmid has to say in the matter of historical enquiry cannot fail of being instructive, and I hope my brother Assyriologists will take to heart the lesson he has read us. Rash and crude conclusions are sure to be jumped at in all new studies, though it must not be forgotten that scientific investigation can only progress by the help of provisional hypotheses. The book is not wholly destructive, however, and Gutschmid has made in it some real contributions to our knowledge of the past. His comparison of the deficiencies of the Assyrian writing with those of the Pehlevi, and his acute suggestion that the Pehlevi was moulded upon the model of the Assyrian, are especially noticeable; so also is his explanation of Isaiah vii. 8 ("within threescore and five years shall Ephraim be broken") by a reference to the fact that, whereas we find an Abibal reigning over Samaria in the time of Esar-haddon (681-673), the city was under an Assyrian prefect in 646 B.C., in consequence, it would seem, of its final subjection by Assur-bani-pal or Asnapper in 669. I am also glad to find him agreeing with my view that the name of Hazael's predecessor should be read Rimmon-idri and not identified with Ben-hadad. Indeed, there is not the shadow of evidence for making the first character of the name Bin or Ben. On the other hand, Gutschmid's harmonistic endeavour to find a place for Pul is more ingenious than satisfactory, and it is difficult to understand how so *scharfeinnig* a critic as himself could have overlooked the probability that it was Polyhistor, or rather Eusebius, who introduced the Biblical Phulus into Babylonian history by identifying him with the Porus of Berosus. As for the land of Muzri, from which came the elephant and apes depicted on the Black Obelisk of Shalmaneser, Gutschmid is probably right in transporting it to Baktria; at the same time there was a Muzri north of Nineveh, and it is hard to explain how, in the main body of his inscription, the Assyrian king could have been silent about so distant an extension of his power, as well as about the road by which his forces had penetrated to Baktria. The word *paku*, again, which I am charged with translating sometimes "year" and sometimes "campaign," really seems to bear both meanings. Dr. Hincks long ago pointed out that

it signified "regnal year," but in certain cases it is used in the sense of "campaign," "campaign" and "regnal year" having come to be more or less synonymous in the minds of the Assyrian monarchs. Gutschmid's view as to the use of the sexagesimal system among the Chinese is, I believe, right; but the question is by no means a settled one, and he does not seem to know that the latest writer on the subject (Schlegel in his *Uranographie chinoise*, 1875) more than justifies what Schrader has said upon the matter.

While, however, full credit must be given to the better sides of Herr von Gutschmid's book, it is impossible not to regret the tone and spirit in which it is written. There is a personal *animus* against the distinguished Orientalist, Prof. E. Schrader, which runs through the whole of it and cannot be too strongly characterised, especially when we remember that Prof. Schrader was until lately one of Prof. von Gutschmid's colleagues at Jena. We had hoped that the days were passed when scholars could import the passions and language of stump-oratory into literary discussions, and when it was possible for a man in Gutschmid's position to accuse Schrader of carrying on a "propaganda" without considering whether the means were fair or foul; to reproach E. Curtius with turning the Greek pantheon into "an Assyrian *παντοκράτωρ*;" to stigmatise scholars like Gelzer or Hildebrandt as "young fanatics;" and, finally, after having exhausted the vocabulary of abuse by calling Schrader "an enthusiast," to speak of England and the English in a tone little less than insolent. Indeed, throughout the book we are never allowed to forget what a fortunate thing it is to be a German, and how much more fortunate to be Herr von Gutschmid himself. Considering the way in which the English nation is spoken of, it is strange that Hincks should be marked out as the one man who, "had he lived longer," would perhaps have proved the Assyrian autocrat from whose conclusions there could be no appeal—unless, indeed, Gutschmid draws a distinction between an Englishman and an Irishman—and still stranger that it is in the statements of English Assyriologists like Mr. Smith and Dr. Haigh that Gutschmid finds the only "correct" appreciation of the value of the chronological testimony borne by the cuneiform monuments. In quitting the seat of the critic for that of the partisan, however, Gutschmid has naturally laid himself open to the very charges he has preferred against others. The whole basis of his book is as uncritical as it can well be. It rests upon two assumptions, (1) that the Assyriologists are to be dealt with in a lump, the whole body of them being made collectively responsible for the sins committed by them individually, and (2) that it is the Assyriologists who are to be condemned for putting forward provisional hypotheses and not rather those historians who, without even that knowledge of Assyrian which would enable them to distinguish between what is certain and what is only conjectural, have adopted and "improved upon" the hypotheses suggested. It is not an Assyriologist, but Herr von Gutschmid himself, who ventures to compare the Derketades of Bion and Polyhistor with the Tiglath-Adar of the inscriptions, little knowing that the god, whose name (as I have said some years ago) I follow Oppert and Schrader in calling Adar in despair of a better transcription, is the only deity commonly referred to in the inscriptions whose true title still remains unknown, and that, whatever else that title may have been, it is hardly likely to have been Adar. Another of von Gutschmid's unfounded assumptions is that the Assyrian scholars all follow a certain "praxis" or "tradition" in their decipherment, and consciously or unconsciously work in the same groove and follow like sheep the guidance of their first teachers. Unfortunately, the converse is only too much the case; at all events, up to the last two or three years the several workers in the Assyrian field have started independently, and to a certain degree in antagonism, and the divergences that

exist between them are the best guarantee the outside world can have of the soundness and accuracy of their work. A glance over the literature of Assyriology will convince every one that the Assyriologists have been by no means that happy family which Dr. von Gutschmid imagines. A similar *fallacia compositionis* is committed in the tacit assumption that because some proper names cannot be read with certainty, therefore all, or nearly all, are in the same case; what Dr. von Gutschmid ought to conclude from his premisses is that those writers whose ignorance of Assyrian prevents them from controlling the readings should abstain from spinning historical theories out of them. As a matter of fact, the number of proper names which can only be read provisionally steadily diminishes year by year: variant readings and parallel texts are constantly increasing the number of those of whose pronunciation we may be certain. When Dr. von Gutschmid asserts (p. 23) that "Champollion has deciphered the hieroglyphics as well as ascertained the sense of the decipherment with a certainty upon which Assyriology in its present state can certainly not plume itself," he simply states what is not the fact. The decipherment of the Assyrian inscriptions is at present in a more advanced condition than was that of the Egyptian hieroglyphics before 1832, and an ordinary historical inscription need not present more philological difficulties than a page of the Old Testament. A good many of the differences between the translations of the Assyrian Canon given by Oppert, Schrader, and Smith, which Prof. von Gutschmid parades with such solemnity, are due to corrections of the printed text; and there is no reason why emendations of the text should disqualify an Assyrian document for being used for historical purposes, any more than they disqualify a Greek or Latin MS. for being so employed. Indeed, the discrepancy upon which most stress is laid is due to von Gutschmid himself; Smith wrote "the king (*den* König) slew," not "*der* König," as Gutschmid mistranslates it. As for the "depreciation of the best Greek sources for the ancient history of the East," with which the Assyriologists are charged, here again we have another *fallacia compositionis*, another attempt to predicate of the whole body of Assyriologists what may be true of one or two among them. Speaking for myself, I can only say that I yield to no one in my admiration of the Greeks; only I do not think that their *forte* was foreign history. The Egyptian monuments have informed us how far Herodotus is to be trusted in his accounts of ancient Egypt, and, though I prize the fragments of Berosus as highly as Prof. von Gutschmid can do, yet I do not forget that they come to us through doubtful channels at second and third-hand; that in one case at least the numbers are demonstrably wrong; and that above all Berosus must have taken his information from those very documents which we are now deciphering, and where first-hand authority is accessible I prefer it, even should the second-hand copy be written in the Greek language. I confess that I am a follower of Sir G. C. Lewis, and hold that contemporaneous evidence can alone be admitted as the basis of solid history, and even contemporaneous evidence must be carefully criticised—as I have publicly stated more than once in reference to the Assyrian inscriptions—before it can be accepted and utilised. But then, it is true, Sir G. C. Lewis had the misfortune to be an Englishman, and I, too, suffer from a like misfortune. It is, I own, a misfortune which prevents me from sharing in Prof. von Gutschmid's confidence (p. 132) that the year 2,448 B.C. was the "year in which Berosus placed the beginning of the rule of the first historical dynasty over Babylon," on the ground, solely, of an ingenious but hardly convincing series of conjectures made by Prof. von Gutschmid himself, or from appreciating the argument that the "Assyrian" Deluge story is not older than the time of Assur-bani-pal, because the description of the gods turning them-

self into animals in an earlier portion of the Isdubar Epic could only have been borrowed from Egypt! The latter argument may be specially recommended to the attention of Mr. Tylor and other ethnologists. It is urged, be it remembered, by a writer who while professing at the beginning of his work to deal only with "Assyriology in Germany," contrives before concluding to introduce a gratuitous insult to a country which has at all events produced a Gibbon, a Grote, and a Thirlwall.

A. H. SAYCE.

JACOPO DE' BARBARJ (JACOB WALSH).

Penkill Castle, Ayrshire : August 14, 1876.

Permit me to follow up Mr. Drury Fortnum's admirable letter in your last paper, correcting the statements in M. Ephrussi's re-issue of M. Galichon's essay on the Master of the Caduceus originally published in the *Gazette des Beaux-Arts*.

In the first place I must remind your readers, or inform them, that the native country of this artist—called by the Italians Jacopo de' Barbarj, presumably because he came from north of the Alps, and by the Germans Jacob Walsh or Walsh, because he was, in their opinion, Italianised by his long residence in Venice—is a question subsidiary to another larger and more interesting one: viz., the part played by artists north or south of the Alps respectively in inventing and developing the arts resulting from the invention of printing. These arts—wood engraving, copper engraving, block (*chiaroscuro*) stamping, which we now call, being done in an increased variety of tints from stone, chromo-lithography—have all been transferred by fuller investigation from Italy to Germany and added to the credit of the north-erns as inventors. But any semi-mythical person, like the Master of the Caduceus, is still seized upon by the stubborn partisans of the "Latin races," and, regardless of evidence, made to lend a conditional testimony against the Teutons.

M. Burty presents your readers with M. Ephrussi's "new conclusions" under four heads. Let us say a few words on them, one by one:—

1. "Venice is satisfactorily proved to have been the birthplace of Jacob. In one of the rough drafts of the Preface to his *Treatise of the Proportions of the Human Body*, the MS. of which is in the British Museum, Dürer wrote '*Jacobus, né à Venise, peintre gracieux*.'" The volume called *Four Books of Human Proportion* appeared the year of Dürer's death, 1528. It has no preface by Dürer, but a long one by Chelidonius, if I remember rightly. Away from London, I am precluded from consulting the British Museum, but I can affirm that there was no rough draft of such a preface there a few years ago, and that the French words quoted do not look like a translation from Dürer, *peintre gracieux* being a modern critical appreciation of the style of Jacob. So far from Jacob's birthplace being satisfactorily proved to have been Venice, it is almost certain, from Dürer's early acquaintance with him in Nürnberg; his knowledge of wood-engraving; his production of a large bird's-eye view of Venice, a production totally unlike any other then done in Italy, but closely allied to the views of towns in the *Nürnberg Chronicle*; and from his association with the German merchant Kolb, who brought out his view of Venice, and appears to have brought Dürer again in contact with Jacob during the visit to Venice in 1506—from all these facts it is nearly certain that he was a native of Nürnberg.

2. "Barbarj must have spent some time in Nürnberg when Dürer was young. In fact, Dürer's family papers show him to have been there from May 17, 1494, up to the time of Dürer's visit to Venice, 1506; in testimony of which M. Ephrussi quotes a fragment of a letter of Dürer's to Pirkheimer wherein he speaks of what, as an artist, he admired sixteen years ago, and cites immediately Master Jacob as one who seems to him to have deteriorated." The number

of mistaken statements here is quite bewildering. The "fragment of a letter," or rather the paragraph of a complete letter to Pirkheimer, which has been quoted in this debate years ago *ad nauseam*, only proves Dürer's boyish knowledge of Jacob's art, and the association of that excellent artist with the Germans in Venice when the sentences were written. We must quote it again, and at this moment I can only do so in the words of my translation in my own *Life of Dürer*, although their correctness in some minor points has been called in question. He speaks of eleven, not sixteen, years ago:—

"What pleased me eleven years ago does not give me the same pleasure now, I confess. Then I praised no one but Master Jacob: but now I let you know there are better painters here, though Anthony Kolb swears there is no better in the world than Jacob. They laugh at him for saying so, but still he continues."

It must be evident to every one that Dürer here speaks of Jacob as an early authority with him at home, and that he still finds him in the German connexion at Venice; so that the evidence is not in favour of Jacob being an Italian, but quite the other way.

3. "The similarity of style and execution often noticed between these two masters proceeds, not from the imitation of one by the other, but from a common source of instruction, that source being Wohlgenuth's studio, Martin Schongauer's engravings, or such as Glockenton's of Nürnberg and Wenceslaus' of Olmutz." Exactly so: they were both High Germans, with the same training. But the resemblance is only in the execution, marvelously fine at this early time, as Jacob adopted the Italian Renaissance of classic taste entirely, and hence his German designation, "Walsh." Dürer, moreover, the later of the two, used again some of Jacob's subjects, particularly *The Satyr's Family* and *Apollo and Diana*.

4. "Jacopo is proved not to have gone with Count Philip of Burgundy to the Netherlands in 1506," &c. Nobody ever affirmed that he went in 1506, or passed through Nürnberg in that year. In fact, from the letter just quoted we know he was in Venice part of the year at least. But it is absolutely certain that he did leave Venice for the North again, either with Count Philip or some other *Herzog*, and that he died in the service of Margaret, Governess of the Low Countries, about fourteen years later. Dürer says in his *Journal* in 1521:—

"I have been to see the Lady Margaret. . . . On Friday after, she showed me all her beautiful things in art. Among these were forty small pictures in oil, pure and good; I have never seen finer miniatures. Also, other good things by Johannes, and by Jacob Walsh. I asked my Lady to give me Master Jacob's book, but she said she had promised it to his successor."

Here he speaks of Jacob in connexion with John (Van Eyck), and shows an interest in him only to be explained by the fact of Jacob being his compatriot. The book in question is supposed to have been a book of sketches; the successor mentioned was Bertrand von Orley.

Mr. Drury Fortnum has corrected the glaring mistake of attributing Peter Vischer's works to the Master of the Caduceus. Mr. Reid, the able Keeper of Prints in the British Museum, also corrected a similar error. M. Galichon, in the *Gazette*, attributed a print in his possession to Jacob Walsh, and actually reproduced it in that publication as a unique example. Mr. Reid recognised it to be by Albert Altdorfer. This print was, nevertheless, the subject of a lively competition at the sale of M. Galichon's collection after his death, and was purchased at a high price by Baron Edmund Rothschild, who was a little surprised when Mr. Reid informed him of the true nature of his acquisition. I hope that M. Ephrussi does not re-issue this among the illustrations to his reprint.

WILLIAM B. SCOTT.

SCIENCE.

The Native Races of the Pacific States of North America. By Hubert Howe Bancroft. (London: Longmans & Co., 1875-6.)

MR. BANCROFT has successfully carried through his great undertaking, and anthropologists are already finding the advantage of having on their shelves a compressed library of reference for the interesting Pacific region of North America. It would not be useful to summarise here in two or three columns a work which is itself a summary (in five volumes of about 800 pages each) of all that several hundred authors have recorded as to the pre-European inhabitants of this vast district. The reviewer's task of giving a notion of this literary museum may be best accomplished by calling attention to a few salient points, especially in the last four volumes, the first having been already the subject of a notice in this journal.*

Most of the available information is here to be found as to that curious problem of American ethnology, the connexion between the nations of Mexico and those of Central America. Uxmal, Palenque, Copan, and other Central American cities whose ruins still remain among the wonders of barbaric architecture, were built by the Maya-Quiché peoples, and the evidence is conclusive that these had derived more or less of their civilisation from the nations of Mexico, the Aztecs or kindred peoples. The Aztec astronomical calendar with its cycles of zodiac-like signs combined with numbers to mark out years and days, its 13-day and 20-day periods, and its solar years of 360 days, made up to 365 by the intercalation of five "empty days," is at once one of the clumsiest and most characteristic chronological systems in the world, and it reappears with but superficial changes in Central America. There seems distinct connexion in the religious systems of the two districts. For example, the characteristic Mexican mode of human sacrifice, by cutting open the victim's breast and tearing out the heart to offer to the god, reappears in Central America with its accompanying cannibal feast; the rite of penance by drawing blood with thorns from different parts of the body was also common to the two districts (vol. ii. pp. 688-9). In thorough harmony with these facts is a curious feature of Central American legend. Readers of Prescott's *Mexico* are familiar with the picturesque figure of the white and bearded divine ascetic, reformer, high-priest and king, who bore the name of Quetzalcoatl, or Feather-Snake. Now, this religious reformer appears also in the traditions of Central America, his names there being of equivalent meaning, Cukulcan or Gucumatz (vol. ii. pp. 633, 699, 717; vol. iii. p. 45, &c.). Without going farther into the argument, it is certainly a great step towards understanding the history of North America before the Conquest, to be able with a certain confidence to consider as historically allied the two groups of nations most remarkable for the height to which they had raised a barbaric civilisation.

* See ACADEMY, April 24, 1875.

Mr. Bancroft's fourth volume is in great part devoted to the antiquarian relics, especially ruins of temples and palaces, in Mexico and Central America, with other remarkable architectural remains, especially the walled forts and towns known as the Casas Grandes of North Mexico, and beyond these again the immense earthworks of the Western United States, raised by the mysterious people known as the Mound-builders. Is there, one may well ask, any historical link between the builders of these rude but remarkable structures and the nations of Old Mexico and Yucatan? Did the ancestors of the Aztecs migrate, as is sometimes thought, across the continent from the North-West, leaving these ruder ruins as tokens of their barbarism before they rose to higher civilisation on the plateaus and amid the forests farther south? In this volume, though the sketches of ruins from each district are not so many and complete as in separate works of Prescott, Humboldt, Bartlett, Squier, &c., &c., yet we have specimens of each kind before us, and can form our own judgment. That of most readers will be that the evidence of connexion does not come to much. The earth-mounds and camps of the Western and Southern States (vol. iv. p. 751, &c.) are not so like the mounds and camps of Mexico as to prove anything. The strong-walled house-forts of sun-dried bricks, or of masonry in the New Mexico district (p. 604, &c.), do not resemble the usual architecture either of the Mound-builders, the Mexicans, or the Central Americans. It is of course possible that closer study of the ruined works may show more correspondences between them, but in the meantime there seems little evidence for connecting the nations of Mexico with the North West, beyond Buschmann's well-known proof from the occurrence of Mexican words in the languages of Sonora, &c. Even here, who can say whether these words were left by Aztecs migrating down the continent, or on the contrary were carried out from Mexico and left among the outer barbarians?

Turning from these specially American enquiries, let us glance at some points which throw light on human ways generally. Among the customs noted by our author there are a few of marked peculiarity. It is by no means usual in the world to find a squint admired as a beauty; but it appears that in Yucatan mothers would intentionally produce it by arranging a tuft of hair to hang between the eyes, or attaching an ornament to hang over the forehead (vol. ii. p. 730). Another custom mentioned is a working out of the magical notion (which may be conveniently described by the German term of the *Angang*) according to which the first creature met with, as on rising in the morning, is supposed to have ominous influence or significance to the beholder. This is an idea familiar to students of magic, but it was stretched to an extreme in that Mexican district, where (if the story is true) men were married by *Angang*.

"In Ixcatlan, he who desired to get married presented himself before the priests, and they took him to the temple, where, in presence of the idols he worshipped, they cut off some of his hair, and, showing it to the people, shouted, 'This man wishes to get married!' From thence he was

obliged to descend and take the first unmarried woman he met, in the belief that she was especially destined for him by the gods" (vol. ii. p. 261).

One may imagine comic situations arising from such a matrimonial plan—some light-footed damsel cutting in at the temple-steps, while the stout heiress provided by the family is still panting round the corner. Again, the custom of killing one of twins, practised in so many parts of the world and accounted for by so many divergent explanations, was known in Mexico with an interpretation even odder than usual. "The birth of twins was believed to foretell the death of one of the parents at the hands of their child; to prevent this, one of the infants was killed" (p. 269). The so-called "Chinese" foot-balancing trick, in which a man lying on his back spins a heavy pole on the soles of his feet, throws it up, catches and twirls it, was practised with great skill in ancient Mexico; the Aztec juggler would even twirl the pole with a man sitting at each end of it (p. 295). There is a good picture of this performance in Clavigero, *Storia del Messico*. As every similarity in customs between Eastern Asia and Mexico may be a proof of intercourse, it would be curious to ascertain whether our modern jugglers derived the feat from the Aztecs, or whether there is any reason to give it an Old World origin. It is worth noticing that the "flying game," or giant-stride, as well known to the New Zealanders as now in our Board School playgrounds, was also practised in Mexico. A tall pole was set up in the public square, on the top of which was a revolving frame with four ropes, each wound thirteen times round the pole, by which four men in bird-costumes flew round. It is suggested that the thirteen turns of the rope, with the four flyers, represented the four thirteen-year divisions of the Aztec cycle of years (p. 295). Very likely this was really so. Had it been in England, it would have been interpreted as symbolising the four seasons with their thirteen weeks each, if not the four suits of a pack of cards.

It appears that America, like Africa, has devised a rite of Mumbo Jumbo:—

"Several Northern California tribes have secret societies, which meet in a lodge set apart, or in a sweat-house, and engage in mummeries of various kinds, all to frighten their women. The men pretend to converse with the devil, and make their meeting-place shake and ring again with yells and whoops. In some instances, one of their number, disguised as the master-fiend himself, issues from the haunted lodge, and rushes like a madman through the village, doing his best to frighten contumacious women and children out of their senses. This, it would seem, has been going on from time immemorial, and the poor women are still gulled by it, and even frightened into more or less prolonged fits of wifely propriety and less easy virtue" (vol. iii. p. 160).

Lastly, among these remarks on customs, it is worth while to notice reasons assigned for the practice of confession of sins, which prevailed in parts of North America. Among the Tacullis, savages of the north-west coast, who hold the common belief in disease being caused by possessing demons, the sick, in extreme cases, often resort to confession to the magician, "on the truth

and accuracy of which depend the chances of a recovery" (p. 143). This suggests a reason for confession quite apart from the moral idea of unburdening the conscience. If the patient is being punished by offended demons, it follows that the medicine-man who has to deal with these demons must be informed what sins have been committed, that he may take the proper steps for propitiation in the proper quarters. With this interpretation in our minds, we may see our way into the origin and meaning of the secret confession of sins as preached among the old Mexicans and Central Americans (pp. 220, 380, 494, &c.), without looking to any wonderful exaltation of motive, or fancying that the rite must have come across from some more cultured religion with highly-developed morality.

Mr. Bancroft's wide and critical survey of American Mythology may do real service in bringing some of its perplexed problems to rational solution. Hard to manage as the subject is, many points seem likely to throw light both on American "pre-history," and on the working of the human mind. Take, for instance, the following myth told among the Thlinkets of the north-west coast. In old days they had no fresh water, but Khanukh, the progenitor of the Wolf clans, had it all. He lived in an island east of Sitka, and he kept the precious fluid in his well, having built his hut over it for better security. But Yehl, the Creator and Raven-god, progenitor of the Raven clans, went in his boat to get water for his people. The two gods met, and at once had a dispute, but Khanukh vanquished the other by taking off his hat, which caused a dense fog to enshroud the helpless Yehl, who howled and wept till his adversary put his hat on again, and the fog vanished. Khanukh then invited Yehl to his house, and entertained him with many luxuries, among which was fresh water. Yehl contrived by a dirty trick to send his host down to the sea, and then, having drunk himself full with the fresh water to the very beak, he put on his shape of a raven, and flew up the chimney to escape; but he stuck in the flue, and got well smoked by Khanukh when he came home, so that ravens, which were at first white, have been black ever since. However, the raven got away, and flying back to his own country scattered the water in drops large and small, so that there are springs and lakes there to this day (p. 102). Mr. Bancroft calls attention to the remarkable correspondence between this tale and the Scandinavian story of Suttung's mead, that mystic compound of blood and honey that gave to all who drank it the skald's gifts of wisdom and song. In vain it was that Suttung kept hidden in his cavern the jars that held the wondrous liquor, for Odin got in by guile, sucked it all up, and then in eagle's shape flew off to Asgard, and poured it out among the Aesir. Such a coincidence may well encourage mythologists to search further for stories which may have been brought by the Norsemen to Greenland and thence spread over the continent by the Eskimo. Beside the general resemblance in this case, it is worth noticing that Odin's Raven and Wolf are both here, though on contrary sides, and that the cloud-hat sug-

gests the wide hat with which the heavenly Odin himself shades his face. This same Yehl, the Raven-god, is also the hero of a local version of that world-wide myth, the stealing of fire. In old days the fire was hidden in an island of the sea, but the raven flew there and brought home a brand in his beak, and got home just in time to drop it almost burnt to embers, and its sparks fell among the sticks and stones, whereby it came to pass that men still get fire by striking stones and rubbing sticks together (p. 101). Perhaps the stories of closest resemblance to this belong to Australia. Tribes there believe that fire at first belonged to the old spirits, but the crow brought it down to earth and gave it to the blackmen; or, that the bandicoot at first had a firebrand and kept it jealously till the birds got it away from him, the pigeon making a dash for it, and the hawk knocking it across the river just when it was being thrown in, and so man got fire (Wilson, *Prehistoric Man*, vol. i., p. 139).

It is a good point about such myths as these that they are not suspect of modern introduction by white men. Nothing can be more delusive than the arguments which have not seldom treated as native the stories which have been mixed up with scraps of Christian ideas derived from missionaries. For instance, there has been put on record a belief among some tribes of Lower California that Niparaya, the Great Spirit, would not receive the slain in battle into his paradise, but sent them down into the prison-cavern of his adversary, Wac (see Tylor, *Primitive Culture*, vol. ii. p. 87). We now get from Mr. Bancroft proofs clearer than ever of the historical worthlessness of the religion of these people. They said that Niparaya, the Creator, had three divine children, of whom one was a real man and born on earth, who lived with the ancestors of the Pericues. "The men at last killed this their great hero and teacher, and put a crown of thorns upon his head" (p. 169). Of the deluge-myths of America, again, some are genuine and instructive, and some stupid modern fictions. Mr. Bancroft's collection is extremely full (vol. v. p. 13, and elsewhere), and he weighs them with a critical appreciation. It is satisfactory to find him insisting forcibly (vol. iii. p. 68) on the spuriousness of the famous story of Coxcox, the so-called Mexican Noah, to which, unluckily, even Humboldt lent his authority. The present reviewer takes this occasion of mentioning a point which has for years seemed to him conclusive against the authenticity of this whole tale, but which neither Señor Ramirez nor Mr. Bancroft seems to have remarked. It is this. The best copy of the Aztec picture-writing on which the tale is founded is that of Gemelli Careri in his *Giro del Mondo*. Here, together with the picture of Coxcox and his wife in the boat, and the talking bird above, and the horned mountain which is the picture-name of the kingdom of Culhuacan, there is also the hieroglyph of a hand grasping a bundle of reeds. This, being interpreted, must be seen to stand for the name of King Acamapichtli (i.e., Reed-handful). But by authentic Mexican history it is known that about the end of the thir-

teenth century there reigned in Culhuacan a real King Coxcoxctli, whose son was King Acamapichtli. It is clearly to the modern times of these real people that we are to refer the migrations by land and water which are recorded in the picture-writing; the Deluge-myth which modern commentators have found in it is a mare's nest.

To conclude: it is needless to repay Mr. Bancroft's costs and labours with phrases of congratulation. He has done what he wanted to do. He has raised his Pacific district into higher importance in the educated world, and everyone appreciates his work. By making accessible so much valuable material, and sweeping away so much accumulated rubbish, he has made a great move toward the production of a real system of American anthropology, some outline of which he may even hope to see in his lifetime. We trust his example may lead others to do the like work in regions whose ethnological materials are unmanageable because no student can get them before him as a whole. Especially we want a Bancroft for India, and a Bancroft for Asiatic Russia.

EDWARD B. TYLOR.

Catulli Veronensis Liber. Recensuit et interpretatus est Aemilius Baehrens. Volumen prius. (Leipzig: Teubner, 1876.)

THE theory of this edition of the text of Catullus is sufficiently simple. Of the MSS. extant only two—the Germanensis in the National Library at Paris, and the Bodleian (Canonici 30)—are known to be as early as the fourteenth century. M. Baehrens concludes that all the later MSS. are more or less interpolated, and therefore untrustworthy. He gives therefore a complete apparatus criticus of these two MSS., and considers that all attempts to emend the text must be based on these two only.

This theory is, of course, in direct opposition to my own views, founded, I may say without diffidence, on a long and conscientious study of the MSS. of Catullus. The original codex from which all extant MSS. seem to spring was brought to light about 1300–1330; the two copies of it (*G* and *O*) which M. Baehrens exhibits were both made about 1370–1380. The Bolognese, which comes next, belongs to the year 1411. There is thus between the parent codex and *G* or *O* an interval of at least forty, perhaps of fifty or sixty years; between *G* or *O* and the Bolognese of rather more than thirty years. To say, then, with M. Baehrens, that all truth is to be found within the compass of two MSS. removed from the original by a long lapse of time, and in all probability by several intermediate transcripts; to eliminate as untrustworthy a MS. which belongs to the immediately succeeding generation, one, too, which bears on its face the most unquestionable marks of sincerity, is a procedure *a priori* open to grave doubts and, in the present instance, we believe, demonstrably wrong. There are passages in which neither *G* nor *O* preserves the right reading, in which the other MSS. have preserved it. Thus, in lxiv. 249, *O* has *Quae tamen prospectans*, *G* *Quae tamen præspectans*, most of the other MSS. *Quae tamen aspectans*. Are we then to conclude with M. Baehrens that the right

reading is *Quae tum prospectans*? Is there any critic who could hesitate to prefer *Quae tamen aspectans*? Again, in lxxvi. 11, *G* or *O* give *Qui tui animo offirmas*, most of the later MSS. *Qui tu*. Are we to conclude that because *tu* is right, *tui* wrong, the MSS. in which *tu* is found are corrected and insincere? The very same reasoning might be used against *G* and *O* themselves. In xvii. 25, all my MSS. except two give *delinquere* instead of *dereinquere*, the right reading; *dereinquere* is found in *O* (about 1370), and Burney 133 (about 1460). What is the natural conclusion? Is it that an Italian copyist ventured to introduce this rather rare word into a poem the metre of which was only known to him imperfectly? Surely not. A far more reasonable inference is that *dereinquere* was wrongly copied *delinquere* early in the fourteenth century, and that most of the subsequent copies transmitted the mistake; but that there were also copies which preserved the right reading *dereinquere*, of which two widely-removed specimens still exist.

And if so, I am not wrong, I believe, in asserting that the transmission of the text of authors is not so simple a matter as M. Baehrens and his compeers suppose; that a superior antiquity of thirty years does not give an exclusive claim to preference; that a paper codex often preserves a more incorrupt tradition than a parchment; that a MS. may even have been written late in the fifteenth century, and yet show the same indisputable signs of integrity as MSS. written a century earlier. It is well known that the Datanus of Catullus was not written till 1463; the British Museum copy of the same original (*a* in my edition) is also dated 1460; yet no MSS. of Catullus are more undeniably sincere, taking them from first to last, than these; and this in spite of the fact upon which M. Baehrens dwells with much emphasis that they contain individual cases of interpolation. On this point I agree, not only with Lachmann, but with every other editor of Catullus except the latest; nor can I profess to think that his arguments against this wide-spread delusion are in any way convincing.

But M. Baehrens is not content with his so-called discovery of the unique importance of *G* or *O* as the only fundamental MSS.—a discovery which he trumpets very loudly and vituperates me for not seeing with the same lynx-eyed clearness as himself, though it is obvious that it was made by a careful investigation of my edition—without pressing his point into farther conclusions of a very hazardous kind indeed. Finding in *G* a great number of double readings of the same word, and that one or other of these readings is generally reproduced in all the later MSS., he jumps to the conclusion that all these later MSS. come from *G*. It is little to say of this conclusion that it is impossible; it is grotesquely absurd. If it were true, how is it that these later MSS. often present readings in an earlier form?—e.g. lxx. 4, *Baiulas G*, *Dauilas* the Bolognese and others, *Dauilas* Catullus; lxxvi. 5, *sublimia G*, *sublamia B*, *sub Latmia* Catullus; lxxix. 8, *cui cum G*, *qui cum B* and *a*; xcvi. 5, *dolor est G*, *dolore est* most of the other MSS., *doloreist* Catullus; c. 2, *Veronensum G*,

treronensum al. *ueronensum* B; ci. 8, *munera* G, *munera* B. Or how is it that the words written in the margin of G at lxiv. 322, *Epythalamium thetidis et peleï*, occur in the obviously earlier form *Epitalamium tethidis et peleï* in B? M. Baehrens replies "the later MSS. all come from G—but through an intermediate copy; in this copy some corrections had already made their way." As if one of the most palpable facts in the transmission of Catullus were not this, that many of the fifteenth century MSS. exhibit the text in a more barbarous, less corrected shape than this very MS. G, dated as it is 1375. I hold it to be far nearer the truth to suppose that none of our extant MSS. were copied from the original rediscovered at the beginning of the fourteenth century; that Canonici 30 is the nearest approach to that original (which I trust my edition of 1867 had made sufficiently clear before M. Baehrens announced it in 1874 as his discovery), G perhaps the next, but not so clearly as to prevent some other MSS. coming very near it as representing in different ways the variations which either existed in the original or were caused by the difficulty of reading it. Nor can I place any reliance on the critical sagacity of an editor who fails to see that, if G and the Datanus come from one source, the antiquity represented by the Datanus is, speaking generally, greater than that of G: so barbarous, uncouth, and in every way untampered with, is the text of the Datanus; so much nearer to the period of correction, the period of the Renaissance, is G.

There are a good many emendations in this new Catullus, as might be expected from the well-known facility of the editor. Among these are some that are clever—e.g. *Amarunsia* for *Ramnusia*, lxiv. 394; *quouis quoque carior auro*, cvii. 5, for *nobis quoque*; lxviii. 136, *tutorum more molesti for stultorum*; cxiii. 2, *Moecilla* (Mucilla) for *Mecilia*. Others are indifferent—e.g. lxvi. 59, *Hi dii uen ibi uario* is emended into *Hic niuei uario*, which is no improvement upon several previous emendations of a perhaps desperate passage; xxv. 5, *cum dira uiuulenties ostendit oscitantes*, which I hold to be inferior either to Munro's *Conclave cum uicarios*, or my own *Cum diua muta gavius*. Some are bad, and should be expunged by M. Baehrens in another edition; such are lxiv. 401, *Patruuit funera for Optauit funera* of MSS.; xxix. 23, *Eone nomine, oro uos, leuissimè* for the perhaps hopeless *Eone nomine urbis opulentissimè* of MSS.

The collation is careful, but there are some mistakes: xi. 9, *O has sui trans*, not *sive trans*; in xxi. 1, *exuricionum*, not *exuritionum*; in xxv. 2, *moricula*, not *moricilla*; xxv. 12, *inimica*, not *ininica*; xxxvi. 1, *Anuale suo lusi*, not *Anuale suo uolusi*; xxxvii. 3, *mentualas*, not *mentuales*; in xlv. 1, a renewed and careful investigation confirms me in my original impression that *septimios*, not *septinnos*, is what the scribe meant and wrote; in xlv. 21 similarly the word is *septimius* or *septunus*, not *septimus*.

R. ELLIS.

SCIENCE NOTES.

MR. J. W. JUDD has been appointed to succeed Prof. A. O. Ramsay as Lecturer on Geology at the Royal School of Mines. After having held the lectureship for a quarter of a century, Prof. Ramsay resigned it at the close of last session, in order that he might devote his undivided energies to the superintendence of the Geological Survey. His successor is without doubt the most prominent among our younger geologists, and has already acquired a European reputation by his researches on the geology of the Mesozoic rocks and on volcanic phenomena.

A REMARKABLE proof of the gradual movement of sand-hills with the prevailing wind was afforded during the revision of the triangles of a portion of the great arc measured formerly by Colonel Lambton in Southern India. Search being made for one of his old stations in a group of red sand-hills, it was eventually discovered that the group must have moved 1,060 yards to the east-south-east, being at the rate of seventeen yards per annum in the direction away from the prevailing wind.

THE results of pendulum observation carried on in India since 1865, calculated at Kew as far as they have been made with the invariable pendulums of the Royal Society, "offer incontestable evidence in confirmation of the hypothesis of a diminution of density in the strata of the earth's crust which lie under continents and mountains, and an increase of density in the strata under the bed of the ocean; and it is clear that elevations above the mean sea-level are accompanied by an attenuation of the matter of the crust and depressions by a consolidation."

A MOST important step has been sanctioned by the Government in the re-arrangement and better organisation of the meteorological observing-stations throughout India, the result mainly of a tour of inspection made by Mr. H. F. Blandford; and an admirable plan of grouping the stations in pairs, one elevated, the other low-lying, has been recommended. Of all the meteorological elements, that of rainfall is the one which most deeply concerns the welfare of the country, through the success or failure of its crops; and in this view such a knowledge of the laws governing the meteorology of India as would enable forecasts of droughts to be made, and give time for providing against deficiency, is of the very highest importance.

AN interesting work which lately appeared at Freiburg, by Professor Landois, on the "Voices of Animals," affords additional evidence of the universality of vocal sounds among the lower forms of animals, including the Mollusca. The author considers it as beyond all question that ants possess a vocal speech, inappreciable by human ears, by which they are enabled to exercise those higher mental faculties to which they owe the development of the advanced social organisation which they exhibit in their communities. Professor Landois' work is illustrated by numerous microscopical and other drawings of his own, and forms an interesting addition to our natural history literature.

Does the present Vegetation of the Globe possess any common and distinctive Characteristics by which it might be recognised in the event of its becoming fossilised?—In a pamphlet of some half-a-dozen pages, a reprint from the *Archives des Sciences de la Bibliothèque Universelle* for December, 1875, M. Alphonse de Candolle proceeds to answer this question. The main object of the writer appears to be to show the fallacy of taking certain species or classes of plants to determine geological epochs throughout the world. In the first place, he states that we have no truly cosmopolitan species, for although many are very widely dispersed, immense tracts exist from which they are quite absent. This assertion holds good for all classes of plants down to lichens, mosses, and

other cryptogams. Some genera and certain families are more nearly cosmopolitan in character. Nevertheless, there are regions of vast extent in which, from a variety of causes, they are not represented. Dr. Hooker did not see a single phanerogamous plant on the antarctic continent, though it is possible he might have found some grass or sedge, or cruciferous plant, had he landed on some other point. Supposing a universal catastrophe which should fossilise the vegetation of the whole face of the earth, these vast expanses would present no trace of vegetation, and according to notions prevailing until quite lately their age would be placed anterior to the existence of vegetation. The proportion of species, genera, or families, is a no more decided character of the vegetation of our epoch. Without due consideration one might be led to suppose that the *compositae* form a characteristic feature of the present vegetation, but an examination of the diversity of the proportions of this family in different countries dispels this idea. In Chili and Juan Fernandez, it forms 20 to 25, and even 33 per cent. of the whole phanerogamic floras, whereas in British Guiana only 3, and in Java and Tahiti only 2 per cent. are composites. Grasses and lichens do not exhibit such great disparities, but neither these nor the *compositae* are peculiar to our epoch. Finally the author arrives at the conclusion that no characters exist whereby the vegetation of the present epoch could be distinguished. And the same remark applies with equal force, if we consider the present time as the continuation of an epoch embracing, not only the pliocene, but also the miocene deposits. Local epochs may be distinguished, but the evidence seems to be against the theory of universal epochs. As an illustration, M. de Candolle says, who knows what was going on in Australia, South Africa, North America, or even Spitzbergen, at the very self-same period when conifers abounded in Europe? We may be able to ascertain the order of the deposition of the different strata in these several regions, but even with the same species in the different regions it would be unsafe to assert that certain strata were of the same age.

"On the Study of Zoology."—We have received a pamphlet with the above title (Simpkin, Marshall, and Co.), being an introductory lecture delivered to his class by Dr. A. Wright, Lecturer on Natural History in the Edinburgh Medical School. It is mainly devoted to an argument in favour of the science as a branch of education. Dr. Wright is strongly opposed to the doctrine of evolution, which he denounces as being in its very extent "inapplicable and unworkable."

Distribution of the Sexes of Stratiotes Aloides.—In a recent number of the *Botanische Zeitung* there is a report of a paper on the distribution of this peculiar plant, read by Dr. Ascherson before the Botanical Society of Berlin. This subject was investigated by Nolte half a century ago, and more recently by De Vriese. The point in question is the apparent isolation and different geographical areas of the two sexes, and we call attention to this subject here because neither of the writers named appears to have thoroughly considered the possibility of the plant being sometimes monoecious. In none of the British floras is there any information respecting the distribution of the sexes, though we believe Syme says he has not seen the male flowers. But he describes the plant as dioecious or polygamous, and Dr. Hooker, in his *Students' Flora*, describes them as subdioecious. Should this prove to be the case, there will be an end to the question of the isolation of the sexes. We have, however, abundant testimony that this plant rapidly spreads by offsets. Among all the specimens in the Herbarium at Kew we found only one that we could say was male, and that is from the valley of the Theiss.

In vol. v. of the *Repertorium für Meteorologie* Professor Wild gives the results of his experiments

on the signal scaffolding at Pulkowa observatory, which afforded an elevation of nearly 90 feet. The observations were taken at 8 A.M., 1 P.M., and 8 P.M., in summer, and in winter at 1 P.M. only. The levels were 6 feet 3 inches, 52 feet 2 inches, and 86 feet 3 inches. The results cannot be given in full in this place, but we may say that they show that between the levels of 6 feet and 86 feet the difference of the daily means is not more than $\pm 0.45^\circ$ Fahr. The amplitude of the range decreases with the height, and the amount of this decrease is 1.8° Fahr. for 46 feet, and 2.2° for 80 feet. In consequence of this reduction of range, the true temperature of the air is lowered 0.9° at a height of 80 feet at the time of the diurnal maximum, and appears to be raised to an equal extent, or even more, during the night. Prof. Wild gives the following rules for thermometrical exposure. The instruments should not be placed lower than 6 feet above the ground. If daily means only are required the height may vary between 6 feet and 65 feet, without an error of more than $\pm 0.2^\circ$ Fahr. If, however, the diurnal range is required, the limits of height are between 6 feet and 16 feet; but then the accuracy assigned above will be ensured. The same rules serve for hygrometrical observations. In conclusion, Prof. Wild finds that the humidity decreases with the height (as much as 12 to 26 per cent. for 80 feet) when the observation is taken in the vicinity or during the prevalence of an anticyclone; conversely, it increases very rapidly with the height (10 to 35 per cent. for the same difference of level) when the observation is taken near a cyclonic area.

PHILOLOGY.

THE most important articles in the last number of the *Hermes* (vol. xi., part 3) are contributions to Latin scholarship. The weightiest paper is that of Helbig on the Iapygians, whom the writer by a number of ingenious combinations brings into connexion with the *Γραικοί*. H. Jordan has a valuable essay on the mutual invectives attributed to Sallust and Cicero, including a consideration of the state of their text, their general character, and their authorship. Morawski opens some questions on the criticism of Charisius. Wilamowitz-Möllendorff ("Memoriae oblitteratae") contributes an interesting budget of miscellanies. Greek criticism is represented in this number by Hercher's continuation of his remarks on Greek prose authors, and by some short papers on inscriptions by Kaibel and Neubauer.

THE *Neue Jahrbücher für Philologie und Pädagogik* (Fleckeisen and Masius), vols. cxiii. and cxiv., parts 2, 3, and 4, contain a great number of short papers on the criticism of various authors which we have not space to notice in detail. The most important essays appear to be, in the second part, Herzog's upon the *lex sacra* and *sacrosanctum*, and, in the third and fourth parts, Jordan's "Novellen zu Homeros," in which some acute remarks will be found on the Homeric words denoting colour; Goebel on the shooting scene in the *Odyssey*; the first instalment of an essay by R. Förster on the writings of Libanius; Cuno on two Gaulish inscriptions; and Bergk's contributions to the criticism of Gellius. E. Baehrens, in the second part, has some valuable remarks on the criticism of Ausonius. There are some good reviews in these numbers, among which may be mentioned Wohlrab's criticism of Schanz's Plato and Schumann's of Stojentin on Pollux. In the educational section the question of modern German orthography is touched upon twice, in part 2, by Didolf ("Zur conservativen Reform unseres nationalen Rechtschreibung") and, in part 3, by A. Kohl, in a review of Erdmann's work *Zur orthographischen Frage*. In part 2 F. Koldewey continues his list of the schoolbooks used in the Wolfenbüttel gymnasium till the year 1651. There is an interesting anonymous notice of Rudolph Dietsch in the same number. The

third and fourth parts contain a valuable Life of Wolfgang Ratke (Ratichius) by H. Stool, and a continuation of H. Pröhl's collection of hitherto unpublished correspondence of Lessing, Ferdinand of Brunswick, von Gleim, and others. There are two strictly educational articles in these numbers, one by C. Hermann on the contrast of the Classical and Romantic elements in the modern study of language, the other on the importance of the study of Hebrew and Hellenistic Greek at the Gymnasias.

FLECKEISEN AND MASIUS' *Neue Jahrbücher*, vols. cxiii. and cxiv., part 5, contain an important summary of the most recent literature on the position of ancient Troy, by O. Frick ("Zur troischen Frage"). There is also a short paper on the Scamander, by P. W. Forchhammer. There is nothing of great importance in the short critical notes on various authors contributed by Bobrik, Rauchenstein and Froehde; among the reviews, those of Schreiber on Flasch's *Polychromie der griechischen Vasenbilder* and of Goetz on the first instalment of Ussing's Plautus, deserve special attention. In the educational section there is an essay by Fauth on the psychological aspects of classical education. Pröhl continues his publication of correspondence between Lessing, Gleim, &c., previously mentioned; and Hess continues a very interesting review of the life of Ludwig Giesebrecht by Calo. A short account of the late Karl Wilhelm Piderit is contributed by F. Heussner. There are also some reviews which do not demand special notice.

The Wasps of Aristophanes. Edited by B. B. Rogers. (Bell and Sons.) Mr. Rogers has already done good service in editing with a metrical translation the *Clouds* and *Peace*. Thus he seems to be supplying the gap left by the incomparable Frere. But if his translations are not equal to those of Frere, he gives us a great deal of critical knowledge, and of valuable commentary in addition. His *Wasps* appears to be decidedly the most complete edition as yet published in England. In an excellent Preface he points out with much force (1) the identification of the Athenian Demos with the Dicasteries. This leads him to defend the MS. reading *ἡμᾶς* (v. 593) against the almost unanimous *ἡμᾶς* of the critics. (2) He contrasts the Dicasteries with our jury-system, and shows that Mr. Grote has not been cautious enough in his remarks on the subject. He also suggests (3) that the play was not an attack on the Dicasteries, but an attempt to wrest them from their subservience to the demagogues. Whether this theory will hold water, seems uncertain; if it be true, Aristophanes has much obscured his real object by his incessant attacks upon the dicasts all through the play. There is much sound learning in the notes, a very sensible appreciation of the conflicting scholia, and often a shrewd comparison—as when he quotes Sir Walter Scott's explanation of the Scotch use of *kitchen*, as anything additional to dry bread, and by it explains the meaning of *ἄψων* (p. 47). The translation is very faithful, and at times vigorous, but the main value of the edition is its scholarly and practical exegesis. We earnestly hope Mr. Rogers will not rest till he has given us the less-known plays with equal completeness.

FINE ART.

A Descriptive Catalogue of the Fictile Ivories in the South Kensington Museum. By J. O. Westwood. (London: Chapman & Hall, 1876.)

UNTIL very recently there was no manual in existence by which a collector of carvings in ivory could make his catalogue, or judge of the comparative value, the country, or period of any specimen. Now there are several books on the subject, Mr. Maskell's

treatise, with his list of the carvings in the South Kensington Museum, standing easily at the head. Ivories are full of interest in the history of art. They occur among the remains of the most ancient cities, and represent the most opposite styles. It would be difficult, indeed, to name any other living art which can trace an unbroken succession from the days of the Assyrians to those of Queen Victoria. The great drawback to its careful study consists in this very fact. It is not easy to turn with the same pleasure from a consular diptych to a Madonna of the thirteenth century, or from a Cupid by Fiammingo to a Runic casket. And of late years, too, an entirely new field has been opened by the discovery of bone carvings among the *débris* of the Stone Age. But the whole number of carvings of any one school is so small that it would be almost useless to make a study of a single period; and it is impossible to consider the different kinds of work as coming under the same denomination except because they are executed in the same material. There is nothing else in common between many classes of specimens; and the immense range which would have to be traversed by a complete work on Ivory is well illustrated by Mr. Westwood's volume.

It may be well to understand clearly, at the outset, what is meant by a "fictile ivory." Mr. Westwood tells us all about it in his Preface. A mould made of gutta-percha mixed with a little wax is taken of the carving; from the mould casts in plaster dipped in warm fluid stearine can be obtained of a colour and appearance deceptively like real ivory. Mr. Westwood himself, with Mr. Nesbitt, Mr. Franks, and other gentlemen learned in art have for years lost no opportunity of obtaining such casts from accredited examples in this country and on the Continent, the result being the accumulation of a series of nearly a thousand in the South Kensington Museum, where they form a valuable supplement to the ivories already obtained, and for purposes of comparison and criticism make the whole collection extremely complete. And not only is this fine series of casts to be seen at South Kensington, but any person may purchase at a moderate cost a duplicate of any specimen he requires.

That the present catalogue, though only a list of casts, is a work of value will be easily understood. Half the objects described are casts from carvings made before the thirteenth century, and a very large proportion of these are of a religious character, thus forming an important addition to our means of studying Early Christian iconography. But, besides this catalogue of the specimens in the museum, Mr. Westwood has added in an appendix the result of an inspection of the great Continental collections, undertaken, "first, with a view to learn the extent and nature of their contents; and, secondly, with the view of pointing out by careful description the most important pieces of which it would be desirable to obtain copies." In some respects this appendix is the most interesting part of the book. Mr. Westwood is not satisfied with making a mere list of the contents of these foreign collections: he gives full de-

scriptions of the chief examples. In one respect, however, we are disposed to quarrel with this part of his book. He does not give us a line by way of summing up. He does not tell us his opinion as to the comparative wealth in ivory of the different museums, nor does he afford us any information as to the history of the collections he has visited, the best way of obtaining admission and casts, or, in fact, any of that kind of entertaining and often useful knowledge which we usually call gossip. Mr. Westwood sternly represses any leanings he may privately cherish towards anecdote or conjecture, and the result is a book which only an enthusiast can sit down to and read through in cold blood. On the other hand, neither is this a book for ordinary criticism. There is no use in finding fault with Mr. Westwood because the authorities at South Kensington adhere to their complicated and silly system of numbering, especially as Mr. Westwood adds numbers of his own in brackets; nor yet because the illustrations are one and all very poor, and might better have been omitted and the place of the twenty-four pale photographs supplied with half a dozen good woodcuts. Three cuts, indeed, are given of the Continental series, and are of some value; but we have more to say about these. A few others—for example, of the ivories in the Hôtel de Cluny—might have easily been obtained at second-hand, and would have been useful. We do not want pictures of casts, when we can easily procure the casts themselves; but we do want pictures of specimens in distant places, to which we have no convenient access, and of which no casts have reached this country. The three examples given only make us wish for more.

The most important cut is that of the so-called Chair of St. Peter at Rome. This seems to be the third, at least, of the same object issued by the authorities of the South Kensington Museum. As the other two—one in Mr. Maskell's manual and one in Mr. Pollen's—do not agree, this third and later one may, perhaps, for the present be accepted as sufficiently trustworthy. Mr. Westwood says of the decorations of the chair that they represent the Labours of Hercules, and six of the constellations, Pisces, Hydrus, Scorpio, Lepus, Eridanus, and Cetus; and adds his opinion that "in the style of their workmanship these little plaques correspond with the Byzantine caskets of the tenth and eleventh centuries," mentioning particularly a casket in the sacristy of the Cathedral of Volterra, and one in the Church of St. Peltrudis at Cividade, in both of which several of the Labours of Hercules are introduced.

Another chair of which Mr. Westwood gives a very full account is that of Maximian at Ravenna, which dates from the middle of the sixth century. Whatever may be the history of the "Chair of St. Peter," there cannot be any serious question as to the identity of this example. Carved on the back is a monogram in which letters are found to make the words "Maximianus Episcopus." The front of this chair is quadrangular, the back being concave on the inside, the top of the back rounded, and the chief decorations occupying the front below the seat. Among them are five figures,

representing St. John the Baptist and the Four Evangelists, surrounded by arabesque borders. The figures are nine inches high, that of the Baptist occupying the centre. Mr. Westwood thus identifies the style of one of these figures:—"The head of the Evangelist with the pointed beard is so exactly like the head of St. Paul in the grand Berlin diptych, while that of the left-hand Evangelist is quite like St. Peter in the same piece, that I could only arrive at the conclusion that they proceeded from the same sculptor's hand. The fine figure of St. Peter in the Archiginasio of Bologna is also evidently by the same hand." Identifications of this kind are very interesting. An eye capable of discrimination of styles is sadly wanted for the same purpose in the study of illuminated manuscripts. We ought to be able to distinguish the art of St. Alban's from that of Canterbury, and to know at sight a work from the school of Hyde or of Glastonbury.

Of another kind of identification, too, we find some examples in Mr. Westwood's book. In his account of this Ravenna chair, he notices the loss of some of the plaques, and recognises them in other places. One, representing the Meeting by the Well of Samaria, is in the museum at Naples. Another is in the Brera at Milan. A third is preserved in the Trevulzi collection in the same place. In the collection of M. Spitzer, exhibited at Frankfurt last summer, he finds "the other leaf of the Ricciardian diptych, of which one leaf is in the Imperial Museum of Vienna." The Vienna tablet is considered to represent the Emperor Justinian, and M. Spitzer's represents a Byzantine empress. In the same collection is a leaf the companion of which is at Frankfurt in the Public Library. Mr. Westwood gives an engraving from part of this remarkable work. It represents a priest in the act of performing mass by blessing the chalice placed in the centre of the table before him. He faces the spectator. The ivory is of the ninth century, and on M. Spitzer's piece, which evidently formed the other leaf, is the figure of a priest or archbishop preaching.

One great advantage of the method of taking casts is the possibility which it gives to collectors of bringing the several parts of a composition together for comparison. As to the success with which the "fictile ivory" imitates the real we have strong testimony from Mr. Westwood:—

"When properly made, and carefully coloured by hand from the originals (the steamed surface allowing the application of common water-colours), it is next to impossible to distinguish one of these casts from the original. I have treated my own copy of the great British Museum Archangel in this manner, and the late Dr. Waagen, one of the most consummate judges of ancient art, could scarcely believe that my specimen was not an original ivory, and the late Count Pulszky was surprised to see in my collection what he considered to be one of his own specimens belonging to the Fajervary Museum, which I had, in like manner, coloured up to the original."

One subject connected with art in ivory Mr. Westwood does not touch. It would be worth while to inquire how far such artists as Aldegraver and the Bohams were engaged in making designs for ivory. It seems very probable that they worked on copper primarily with some such object.

Examples of carvings occasionally occur in which the carver has closely followed the engraver; but the most common form in which such examples are found is that of engraving in black on flat plaques, for the ornamentation of arms and furniture. This art, which is at least as ancient as the invention of engraving on copper, and is in some respects analogous to *niello* work, has hitherto been neglected by writers like Mr. Westwood. It is not unusual to meet with plaques engraved in this way after Dürer, and not long ago an ancient ebony table inlaid with ivory tablets engraved with the Labours of Hercules after Aldegraver was sold by auction in London.

We have one or two faults to find with this valuable book. Setting aside a long list of errata, most of which Mr. Westwood corrects himself in the appendix, we are inclined to quarrel with the insufficiency of the indexes. There are, in fact, three in all, but one good one would have been far better. First we have, what is so needful in all these South Kensington treatises, an index of numbers. Then comes a so-called "Index of Museums:" but it is only a list of the museums noticed, the greater part not being in alphabetical order. It is quite as easy to find a collection in the text as in this apology for an index: that is, when a name occurs in both, but in this respect there is a discrepancy on the very first page. Lastly, there is an alphabetical list of subjects, with which we have no fault to find, except that there would have been no occasion for it had the book contained an ordinary general index.

W. J. LOFTIE.

THE "BLACK AND WHITE" EXHIBITION.

Paris: August 11, 1876.

I referred in a recent letter to an attempt which was being made here to organise an exhibition similar to your Black and White. Such a one, called like yours "L'Exposition des Ouvrages exécutés en Noir et Blanc," has now been opened.

Very few of the papers have taken any notice of it. People still find it difficult to understand what possible practical and aesthetic interest can attach to drawings and engravings. They are matters which, according to our academical education, are not "noble." And yet the *Gazette des Beaux-Arts* devotes several pages to them every year on occasion of the wretched exhibition of engravings, drawings, water-colours, &c., which accompanies the yearly Salons. It is clear, as the writer of the article points out, that, in the ill-lighted rooms of the Palais des Beaux-Arts, after the exhausting process of looking at the paintings, the public cannot bring any critical interest to bear on works which essentially need quiet and attentive study. We do not pretend that the collection now on view in M. Durand Ruel's rooms is perfect. It is confused and too numerous. Far too many beginners, or people who delude themselves as to their capabilities, have seized this opportunity of appearing in public; while the official engravers—members of the Institute, for instance, or their well-known pupils—have kept aloof, and thereby deprived this attempt at a free exhibition of the prestige which their name, their works, and their high position would have given it in the eyes of the public. Everything tends to prove that we are not yet used to associations of this kind. Our new political ways will probably lead us on in that direction.

But nevertheless, such as it is, the present exhibition has already been productive of one

good result—that, namely, of having brought over a certain number of English artists to the Continent. Of late years those who draw for the *Cornhill Magazine*, *Punch*, and more especially the *Graphic*, have exercised considerable influence on our designers, engravers, and publishers. A skilful and refined draughtsman, M. Edmond Morin, whose name deserves to be mentioned in connexion with the present movement in popular art, that which most directly addresses itself to the mass of the people by the multiplication of artistic reproductions, is the promoter of the movement. He spent several years in England at the beginning of the Empire, and worked with Sir John Gilbert. The dash he introduced on his return into the composition of domestic scenes, regattas, public ceremonials, hunting episodes, &c., struck our artists very much. Besides covering much larger blocks than we were accustomed to see in our illustrated papers with the most extraordinary ease, M. Edmond Morin added immensely to their effect by the admirable sense of light he evinced in the distribution of his blacks and whites. He possessed in the highest degree the feeling for what we call “*taches*”—i.e. for black parts in bold contrast with large spaces of white, and the suppression of intermediate grays.

One advantage of this system, economical as well as ingenious—since it allows the wood-engraver to proceed more rapidly, and to preserve more accurately the character of the artist's pencil—was that it brought Gustave Doré's method into disuse, a method which consists in concentrating the light under all circumstances upon some single point of the composition, and bringing all the rest into subordination to this brutal and tiresome effect.

With reference to Edmond Morin, for whom I have a great esteem, and whose natural modesty has been the only bar to his becoming more famous—to his receiving a decoration, that is to say, which is the dream even of the wisest among us—I would further remark that he is an excellent water-colour painter.

Your English artists are represented by the drawings of Mrs. Allingham (Helen Patterson)—much admired for the delicate feeling shown in her figures of women and children—of Messrs. Du Maurier, Herkomer, Woods, Hopkins, Marks, Gregory, Green, Linton. Your artists in general, we notice, aim at brightness more than ours do; then at natural attitude; next, truth of scenery or furniture; and lastly, at expression of feature: whereas ours, with their more classical education, give their figures a better equilibrium, and draw hands and feet more correctly. Also, our wood-engravers have, in some instances at least, made studies from the life which enable them to make their figures look like real men and women, and to draw the nude with greater vigour and suppleness.

With these few reservations as to technical qualities and defects, I do not hesitate to own how useful it is for us to study the general conditions of your art. We have no such thing as political caricature left in France, or as caricature of domestic life. Everything has become brutal or stupid in conception, inadequate in the rendering. Our press laws have, it appears to me, produced just the opposite effect to what the legislator expected: the artist who feels a sentence of condemnation perpetually hanging over him never rises to the level of his thought, and either remains obscure or grotesque or else oversteps his mark, and, having lost the habit of struggling with ideas, attacks his personages with strokes of unparadonable violence.

The *Eclipse*, a paper illustrated from the first by André Gill with large coloured drawings, sometimes highly ironical, has now been obliged to change its original form for a more economical one, because the public demanded caricatures of political celebrities, and it was impossible to furnish them sufficiently severe to satisfy

them. With you public opinion serves instead of police. At the house of my friend Mr. Edwin Edwards last winter in London, I turned over several hundred sketches or studies of Charles Keene for his drawings for *Punch*. In treatment they are most interesting, but far more interesting to me was the truth of observation, the sincerity of criticism, the delicate insinuations, the moderate form which the fun invariably took when the subject to be represented was one of those popular dramas the scene of which is laid either in a ball-room, at the sea-side, beneath a window, or on a bench in the park.

Mr. Bradley, of Florence, and M. Buckman, of Brussels, are the only other foreign artists to be met with here. Our own illustrated papers have sent nothing, but our Reviews are here: the *Gazette des Beaux-Arts*, *l'Art*, *Paris à l'eau-forte*; also, Cadart's monthly publications and Durand Ruel's enormous and most interesting illustrated catalogue.

The lithographs, which are as interesting when they are the work of a painter as an original drawing in black chalk, are attracting the attention of our amateurs. Fantin has sent his *Anniversaire de Berlioz* and his highly poetical scenes from *Tannhäuser*; Manet, some bold and singular sketches; Amand Gautier, a portrait; Chauvel, a proof of a *Marine* of Méryon's, which has never been in the market. Méryon, a retired officer of the navy, with an accuracy which is the admiration of all seamen, and a poetical feeling which enchants all poets, drew a corvette executing her *abbatie*, which, it appears, is a difficult and complicated movement, as creditable to the captain in command as to the crew who are able to execute it well and quickly. The drawing is in chalks. Méryon had a defect in his vision which made it difficult for him to distinguish differences of colour—for instance, he took red for green. I only know three chalk-drawings by him, and a little bit of oil-painting, painted in great part with the finger for a brush. The sea-line is dark and gloomy. The vessel is seen, with her sails puffed out by the wind, heeling over to the right, like a swan turning round in the water. The tops of the masts and the rigging are cut off by the frame, and this gives the vessel, which just skims the surface of the waves, almost fantastic proportions.

MM. Léopold Flameng, Edmond Hédonin, and Charles Waltner were the devoted organisers of this attempt to introduce a new and hitherto unsuspected source of enjoyment to the public. The pleasure of hunting after and securing a fine proof of a fine work, of an etching, a dry point, a lithograph, or even a coloured woodcut, is a more attainable one than that of becoming possessed of a painting by a master, and, in the hours either of solitude or of intimate companionship, is a source of charming reflection and conversation to the amateur who is really enamoured of the endless varieties of the art. There is no doubt that the taste for modern etchings and lithographs, now beginning to show itself with us and with you by the high prices attained originated, with the group of amateurs who, in 1859, founded or kept up the *Gazette des Beaux-Arts*; thence also arose the need for newer publications, such as the *Portfolio* and *L'Art*, to present their subscribers with more and more perfect works.

M. Legros has sent some pen-and-ink drawings from London, very splendid in style. Mr. James Tissot contributes some dry-point studies of figure-subjects and landscape which have awakened lively curiosity. The dry-point process, which Mr. James Whistler has treated with great superiority, has for the last two years again become the fashion here, through the able portraitist M. Desboutsin.

I cannot dwell more at length on this exhibition: it is sure to be succeeded by a similar one next year, arranged on a better system, if the artists who have taken part in the present one have the good sense to combine and elect a committee of management, to consist of modest and

devoted workers, together with artists and amateurs.

The Union Centrale des Beaux-Arts Appliqués à l'Industrie is holding its fifth exhibition in the Palais de l'Industrie. Like the three preceding ones, it is a double exhibition—that is, the rooms on the first storey are devoted to a retrospective exhibition of Flanders, Beauvais, and Gobelins tapestries; and the nave to the industrial productions of modern art.

In spite of the heat, which is cruelly intense, the public come and are interested. I shall tell you more about it hereafter. Noticeable in the modern department in point of number, quality, and originality, is the ceramic collection.

I must confine myself to a few brief notes on the several competitions for the “Prix de Rome.” We must not judge of the works of the competitors as we should at the Salon. We must recollect that the competitors receive a special education, and at the decisive moment would lose all their advantages if they did not restrict themselves to obeying traditions. The painting is mediocre, and holds out no promise of either a good draughtsman or a good colourist to come. The subject was “Priam asking Achilles for the Body of Hector.” The sculpture was better. The subject was “Jason carrying off the Golden Fleece.” A prize is given every half-year for line-engraving—that art which is dying of old age. The subject set for the students of architecture was “Un Palais des Beaux-Arts.”

PH. BURTY.

CHRISTIAN ANTIQUITIES AT ROME.

Not long ago another link in the chain which unites the earlier Mediæval with the later Christian art in Rome was secured through the identification of a small and obscure building near the Appian Gate as an ancient oratory, dedicated to the Archangel Gabriel and the “Seven Sleepers” of Ephesus—the now much dimmed but still valuable and interesting frescoes on its walls (figures of the Saviour and St. Gabriel, besides other archangels; also of sainted Doctors and other canonised persons) being, as may be inferred, of some period in the eleventh century. Recently there has been discovered another long-forgotten—indeed, totally buried—chapel for the worship of the primitive Church (apparently of much higher antiquity than that on the Appian Way), under a mound of earth near the railway station on the Viminal Hill, and precisely in that part of the heaped-up soil where the remains of the Agger of Servius Tullius are obscured by, or rather confounded with, later adjuncts, the gradual growth of centuries, that have so much altered the modern as compared with the ancient level of Rome. Here was lately brought to light, in the course of labours for clearing away the soil on railway premises, first the roof, and gradually the whole upper part of a building, recognised by its terminating member in form of a vaulted apse, and still more clearly by the paintings on its inner walls, as a Christian oratory. The subjects of those fresco paintings are such as the traditions of primitive sacred art prescribed for church walls: the Saviour on an elevated throne, dressed in a tunic and pallium, the face beardless, the aspect youthful, seated in the midst of the twelve Apostles, who are also seated, and in similar costumes, with sandals on their feet, each holding a volume in the left hand; the Divine Master having two caskets filled, not with volumes, but scrolls (the books of the Old and New Testament) placed beside His feet; His head alone being encircled by the nimbus, which the others are not distinguished by. The style of these figures, and of some accessory ornaments introduced in the painting, suggests dates within either the later years of the fourth or the earlier of the fifth century. When we have the benefit of Chevalier de Rossi's elucidations and comments on this recent discovery, which may be expected in

the forthcoming *fascicolo* of his *Bullettino di Archeologia Cristiana*, we may arrive at more definite conclusions with respect to the merits and the presumable period of these long-lost paintings.

In those hypogea called "Catacombs" not much has been done of late, excepting some works for the further excavation of the south corridors in the cemetery of St. Callixtus, on the Appian Way; also certain labours, now suspended. I am sorry to learn, owing to want of funds, in that range of the St. Agnes Cemetery entered below the extramural basilica of Sant' Agnese on the Nomentan Way. That part of the hypogeum in question was first re-opened about eight years ago by the monks—Lateran canons—established in the long-deserted cloister adjoining the same basilica, by desire of Pius IX. Their discovery was but slowly followed out. We may infer that a great part of the subterranean corridors and chapels, connecting this with the others, the previously known section of the St. Agnes "Catacombs," has yet to be cleared out. But what those monastic canons have already discovered below and around their church is indeed most interesting. The excavated *loculi* (or tombs cut in the solid tufa, rising tier above tier) are, at least in the great majority, still closed and intact. The epitaphs—among the many Latin a few being Greek—are, in several examples, of such fine orthography and good Latinity as justify the inference of very early date, within the second, if not actually (as the directors of these *scavi* themselves assume) within the first, century of our era. Two small chapels containing those more honoured tombs called *arcosolia*, which were undoubtedly used as altars for Eucharistic rites, are the latest discoveries of importance obtained before the want of means obliged labours here to be discontinued, about the beginning of the spring. Near an angle in one of these ancient oratories there are two sepulchres, each with a glass vase and a terra-cotta lamp set into the tufa below the bed of death, and nearly at the level of the floors. The glass vase, though broken, is still marked by those dusky reddish stains believed to be blood, and therefore to be classed among those records which, when thus placed beside the tomb, ecclesiastical authorities in Rome have determined to be the recognisable signs and tokens of martyrdom. Other objects found in this section of the subterranean cemetery are noticeable. Beside one tomb is set in the tufa a cameo, apparently of dark-hued agate, with a female figure riding on a lion in *intaglio*—this serving, no doubt, as a mark of recognition for a not otherwise distinguishable sepulchre; clumsy objects similarly used for the identifying of the graves are fibulae and ivory dice. A monogram of the Holy Name—X P—in bright-tinted mosaic, found in the soil with which one of the corridors was filled, is an almost unique specimen of such formation of the sacred letters among the ornaments of the Roman "Catacombs." The following brief epitaph implies in symbolic phrase an artless testimony to the belief in the Divinity of Christ, with such retrospection of the life as seems to preclude all notions of prayer for the departed one: "Heracius qui vixit in pace X P. annis LV." None of that pictorial decoration which abounds in the other parts of the Sant' Agnese Cemetery is seen here; neither painting nor sculpture, save in one sole instance, on a tombstone, the incised figure of a female *orante* in the usual attitude of prayer. The massive brick walls, in good preservation, which cover some of the tufa surfaces, and in some of the chapels form fronts that conceal the tombs, are evidently of later date, perhaps thrown up for support to the buildings of the church when the St. Agnes basilica was restored by Pope Symmachus, about A.D. 500, or for the other rebuilding of it by Pope Honorius I., 625-638. It is to Christian epigraphy, not to Christian art, that the acquisitions in this newly-discovered hypogeum are important.

I am sorry to report what seems to me a most unsuitable attempt at restoration—that, namely (ordered by ecclesiastical authority), of the long-buried basilicas discovered about two years ago between the Ostian and Appian Ways, and in communication with a section of the vast cemetery called "Catacombs of SS. Nereus and Achilleus." This interesting example of early Christian architecture has been styled "Basilica of St. Petronilla," because supposed to have been dedicated to the martyred daughter—either the real or spiritual child—of St. Peter. It was found all roofless, with some scattered columns and their basements *in situ*, the apse partly preserved from decay, and the *Confession*, or Crypt Chapel, under the high-altar still discernible, though ruinous. De Rossi believes it to be so ancient as the fourth century; but there seem to be grounds sufficient for assuming that it is mainly the restoration or enlargement of a primitive chapel, dedicated to the above-named saint and to the SS. Nereus and Achilleus, whose bodies lay in the contiguous cemetery—the original building, perhaps, of that early date, the restored one of a period towards the end of the eighth century. Descending into this disinterred church, at a depth considerably below the surrounding Campagna, we may enter a dark corridor, behind the apse, and thus reach one of the small oratories of the adjacent "Catacomb," where over an *arcosolium* we see the figures, painted within the arched recess above the altar-tomb, of Petronilla and another saint named Veneranda, each with name inscribed, the former youthful, the latter more matronly in aspect, and with a veil over her head, her (Veneranda's) attitude being that of prayer, with extended arms.

The works now in progress—which I must regret, as they threaten, not truly to restore, but to alter and mask over the antique—have already gone so far as almost to renew the original apse of this basilica, and surround its chancel, its nave, and aisles, with high modern walls, indvidiously withdrawing from view what is venerable, and detracting from the picturesque in the long-buried structure. It is, I believe, the intention to roof over the entire building. Something similar, though fortunately not carried so far as essentially to alter the antiquities now provokingly concealed, has been effected in the case of two other ancient, and alike disinterred, basilicas, both long hidden by accumulated earth, and both rescued from oblivion in the time of Pius IX.—that of St. Stephen, founded by a matron named Demetria in the fifth century, near the Latin Way, about two miles from the Lateran Gate (Porta S. Giovanni), and that (probably of much earlier origin) on the site of the martyrdom of Pope St. Alexander (A.D. 130), whose body was laid under its high-altar, at about the eighth mile from Rome on the Via Nomentana.

O. I. HEMANS.

NOTES AND NEWS.

MESSRS. HUNT AND ROSKELL (New Bond Street) have had on view lately a service of silver-gilt plate manufactured by them for the Mikado of Japan. Certain elements of Japanese design—the dragon and stork in especial—are largely utilised in the decorative forms of this plate, which is, of course, handsome, sumptuous, and what not, so far as material and workmanship are concerned. However, if we substituted the word "spoiled" for the word "utilised," we should not be far astray from the truth; for, in fact, there is no genuine designing capacity shown in the service. We wish that the Japanese could only be persuaded that, in matters of decorative art, they are now committing an act of national *barakiri*, and that competent people in Europe mourn and groan over the replacing of the magnificent and unmatched Japanese work by the stunted, stunted, and incapable European work of our epoch.

We understand that the elections at the Royal

Academy of the three Associates to fill the places vacated by Mr. Poynter, Mr. Leslie, and Sir John Gilbert, will not take place till January of next year. At that time there will be a further addition to the associateship, in accordance with a determination already announced. Some little time ago, when reform in the constitution of the Academy was being discussed, there was talk of a very salutary rule to the effect that no vacancy in either rank should be allowed to remain for more than three months; but, if the above-named date for the election is correct, we are forced to suppose either that the rule was never finally adopted or that it has been since rescinded.

THE awards of medals in the Fine Arts Department of the Philadelphia Exhibition have been made, and the report of the jury will shortly be published. Thirteen medals have, we believe, been awarded to English artists, and sixteen to the French. The jury was composed of representatives of all nations, Mr. Cope, R.A., acting on behalf of England. Among the successful English competitors, Mr. Fildes and Mr. Holl take a prominent position. The former was represented by his picture of the *Casuals*, and the portrait study called *Betty* exhibited in last year's Academy. The show of English pictures, thanks to the energy of the Fine Arts Commissioner, turned out, on the whole, a good one. Mr. Leighton, who is, without doubt, among the medallists, was represented by his beautiful picture called *The Summer Moon*, and Mr. Millais by a less important work called *Early Days*. Mr. Millais, we believe, does not occupy a foremost place among the successful competitors.

MR. WALTER PARIS, a pupil of the late Mr. Rowbotham the water-colour painter, has lately returned from the United States with a very interesting series of sketches of American scenery.

AMONG the artists who will contribute to Sir Coutts Lindsay's new Gallery in Bond Street is Mr. Richard Doyle, whose water-colour paintings, highly valued wherever they have been known, have but rarely been brought within the knowledge and appreciation of the public. The peculiar character of Mr. Doyle's invention has always secured for him a unique place in modern art, but to many it will be a surprise to find how happily that invention can express itself in delicate and graceful schemes of colour. It is rare to find a fancy so free and unrestrained associated with a regard for nature that is both searching and intense. Sometimes the artist allows himself to realise the beauty of an actual scene without the intervention of any fairy incident, and sometimes the choice of weird or mysterious landscape seems naturally to demand the presence of the little fairy people who inhabit his pictures. In the first class we may mention a view of the river Nith in Scotland, and a powerful study of the village of Haworth, Charlotte Brontë's birthplace, with the large churchyard half obscured by the grey light of evening. In the range of fanciful subjects Mr. Doyle's invention seems inexhaustible, and yet remains always delicate and graceful. He has completed two exquisite little drawings in illustration of the legend of La Dame Blanche. Larger designs represent *The Dragon Slayer's Return* and the *Return of the Fairy from the Christening of the Sleeping Beauty*. Both of these are elaborate compositions brim-full of a humour that never forgets the claims of beauty.

AMONG the coins and medals collected by the late Mr. Robert Younge, which were sold by Messrs. Sotheby, Wilkinson and Hodge on the 9th and 10th of this month, were the following noteworthy lots:—a Mysore war-medal, 1791-92, 7l. 10s.; a St. Patrick's halfpenny, 1l. 15s.; a Philip and Mary shilling, 1l. 6s.; a noble of Edward IV., 1l. 16s.; an angel of ditto, 1l. 7s.; a five-guinea piece, William III., 6l. 17s. 6d.; a quadruple dollar of the Genoese Republic, 1697, 1l. 5s.; an Anne farthing, 1l. 5s.; an Oxford pound piece, Charles I., 1643, 4l. 6s.; a ten-

shilling piece, ditto, 1644, 2l. 6s.; another, 1642, 1l. 14s.; a Charles I. crown, 1l. 2s.; five Commonwealth crowns fetched from 1l. 2s. to 1l. 15s.; a set of crown, half-crown, and shilling of Cromwell, 1l. 8s., and an oval silver Dunbar medal, with bust of the Protector by Simon, 1l. 8s.; a double stater, Panormus, 3l. 18s.; a gold macrinus, 14l. 5s.; a denarius of Didius Julianus, 1l. 10s.; a Legion of Honour, Napoleon, First Consul, 15s.; a Legion of Honour, Henry IV., 16s.; a gold cross, Louis, 2l. 6s.; ditto, Louis XV., 1l. 12s.; ditto, St. Stanislas of Poland, 1l. 11s. A collection of about 2,700 tradesmen's tokens, in copper, of the seventeenth century, including 300 varieties not mentioned by Boyne, sold for 43l.

THE splendid collection of china and faience in the Museum Johanneum at Dresden has just been opened to the public. It consists of more than 20,000 pieces, and will drive collectors to despair. It is hoped that the keeper of the collection, Prof. Graesse, will soon publish a catalogue.

It is announced that a Photographic Exhibition, organised by the Edinburgh Photographic Society, will be held in the galleries of the Royal Academy next December. The exhibition is to be international and competitive, and medals are to be awarded for separate classes of reproductions, the cost to be defrayed from a fund especially subscribed for this purpose. It is likewise intended to illustrate the historical development of photography from its earliest beginnings to the present day, and to show some of the many processes now in use. The exhibition will be opened on December 15 and closed about the middle of January.

A LARGE and carefully-executed wood-engraving of Albrecht Dürer's great painting of the *Trinity*, in the Belvedere at Vienna, has just been finished by Josef Schönbrunner for the German Society for the Reproduction of Works of Art. It will be interesting to compare this modern effort of xylographic art with Dürer's own magnificent engraving of the same subject, which is considered one of the finest works that German wood-engraving ever produced. The Dürer woodcut is not identical in design with the painting, although executed in the same year, but it bears a close resemblance to it. The modern engraving exactly reproduces the painting, and has at all events the advantage of being considerably larger than the old. It measures more than two feet high.

SOME interesting Roman antiquities, such as terra-cotta vases, lamps, and small glass hour-glass, &c., have been discovered by some workmen at Capua, while digging the Traforo Canal. In the neighbourhood of Francolise also, on some property belonging to Signor Pietro di Rosa, seven tombs have been excavated, which were found to contain bronze bracelets, lamps and coins. One can hardly, indeed, take up an Italian newspaper without finding records of discoveries of this sort, not only in Rome and its neighbourhood, but all over Italy.

THE articles on the Salon by M. Charles Yriarte and M. Louis Gonse are finished in this month's number of the *Gazette des Beaux-Arts*. It cannot be said that the illustrations to these articles have been distinguished by any particular merit; indeed, many of them have been so poor that it is difficult to understand how they found place in such a journal. It is to be feared that this long-famed Review will lose its well-earned position in the artistic world if it goes on much longer lowering the standard of its artistic excellence. It would be sad to see it superseded by a younger rival. One illustration, however, in the present number is a little gem. It has nothing to do with the Salon, but is etched by W. Unger, from a drawing by Rembrandt of his charming young wife, Saskia van Ulenburg. An inscription underneath tells us that it was taken by the

master three days after his marriage. The original is in the Cabinet of Prints at Berlin. It has evidently been rendered with the utmost fidelity and sympathy by Unger, and is almost as good as a real Rembrandt. The only articles beside notices of exhibitions in the number are a description of the bed of Castellazzo, under the title of "Art et Industrie au XVI^e Siècle," by the Marquis Girolamo d'Adda; a short account, by A. Racinet, of Virgil Solis, the Nürnberg engraver, who, however, is not usually reckoned as one of the Little Masters of Nürnberg, this term being more correctly limited to seven of the more immediate pupils and followers of Dürer; and a catalogue of the furniture and other objects from the Château of Versailles which were sold during the Reign of Terror. This catalogue is taken, strange to say, from a Dutch contemporary newspaper, but the description of the "unheard-of luxury of the richest Court in Europe, of the grandeur of which there is now no trace," is most probably derived from a French paper. The sale does not seem to have taken place in Holland.

THE STAGE.

"ARRAH-NA-POGUE."

Arrah-na-Pogue, the Irish drama reproduced at the Adelphi on Saturday, is an overpraised piece. Its characters share the lot of most of Mr. Boucicault's *dramatis personae*, in that it is a difficult thing to have any serious care for them or for their fortunes. Here, as elsewhere, strong human interest is wanting to the work of Mr. Boucicault. The lack of it was atoned for in the earlier and more ambitious literary essays—notably in *London Assurance*—by a glitter of dialogue and liveliness of intrigue. *Old Heads and Young Hearts*, which is likely some day to be allowed to be about the best piece by its author, had something of the true ring of human interest wanting to the rest. The great quality was not so much as sought in *Babil and Bijou*—which London accepted as a display of barbaric splendour in dresses, lights, and women—and in the popular Irish pieces of which the *Colleen Bawn* was the first and the *Shaughraun* the last the lack of it was atoned for by the adroit presentation of the virtuous puppets of the stage, dancing in the accustomed places at the bidding of the accomplished hand.

The first-rank puppets here—the hero of humble life, the hero of an upper class, the gushing heroine of the cabin, the stalwart soldier, the cringing informer—are types as familiar and habitual as those of the still more popular entertainment to which the cheerful drum is wont to beat the summons in every London street. Shaun the Post, Beamish Mac Coul, Colonel O'Grady, Michael Feeny, and Arrah Meelish are conventional embodiments of the vices and the virtues, or genial mixtures of the two. Their fortunes are too well known for us to need to follow them in detail, and one can but enquire how it is that they and the work in which they appear continue to be welcome to a large public. For not only are the characters themselves the conventional and common properties of the stage, but those that are held to be most winning are here occupied in setting authority at defiance, and sympathy is given, not to the English suppressors of insurrection or allayers of discontent, but to the Irish in rebellion or unrest. But this is easily explained. London has forgotten Clerkenwell, and a London audience, far from the island washed by a "melancholy ocean," does not trouble itself in the least with the vexed questions of local politics, even when they become large and threatening. It sees an artless heroine, unjustly accused, and a spirited hero, bearing a charge he would be proud to suffer for; and it sees in these the generosity and geniality of the Irish character—recognises in them the fine and pleasant qualities really much rarer, to its thinking, on this side of the Channel

than on that; and its applause of Mr. Boucicault's Irish dramas is an unconscious tribute to our English need of the Irish gifts of humour and fascination. The Irish blitheness and cheeriness which play through Mr. Boucicault's pieces are elements of national character, the value of which we instinctively recognise. Ireland may have been troublesome to Britain, as France to Europe. That goes for nothing. We can no more do without the Irish spirit than the Continent can do without the French. There is a sort of personal charm that is a very real force; and something of the strength of it is shown in the reception of Mr. Boucicault's dramas, when most things in them but the national humour may be either wearisome or repellent.

But of course Mr. Boucicault is too artful a playwright to give even a long-suffering or easily-pleased public his work in a crude form. If he gives his Irish popular humour, he does not give it alone. He had had thirty years' experience when he wrote *Arrah-na-Pogue*, and like a physician skilled to treat his patient, he had learnt, not only the ingredients of the draught to be liked as well as swallowed, but the proportions in which these must be mixed. The ingredients of the Irish melodrama, as it is everywhere administered, are easy to discover. There is popular humour, and there is a faction fight; there is a sunset in Wicklow, and there is a grouping of red petticoats; there is a song with a chorus; there is a cabin which is the home of suspected virtue, and there is a mysterious stranger striding in a long cloak. These are the ingredients; but how to mix them? That is indeed Mr. Boucicault's art, which Time has perfected; so that he can put together a piece any serious human interest in which, as I began by saying, it would be difficult to discover, but which somehow holds the attention of Adelphi pits and galleries on our weariest summer nights, and does so, too, without any exceptional display of the craft of the actor.

For the opportunities of acting, not being great to begin with, are indeed but sparsely taken. Mr. Williamson succeeds Mr. Boucicault himself as Shaun the Post, and he, though without the variety of the older favourite, has the saving quality of genial humour. Unknown in England twelve months ago, the Adelphi has now adopted him. Miss Moore, his companion in these Irish pieces, is likewise fully accepted. She is not without pathos, and she can sing a song with intelligent expression. Her patriotic ditty "The Wearing of the Green" is justifiably repeated. Mr. Terriss is accustomed to characters in which it is chiefly important to appear comely, and, though without much force at present, he has sufficient grace. Mr. Shiel Barry, succeeding Mr. Dominick Murray as the informer Feeny, gives to the part more individuality than its conventional attributes would seem to allow. Miss Hudspeth brings to the not-pleasant part of Fanny Power but little air of reality. Mr. Emery, for the time being, can hardly be said to be wasted as Colonel O'Grady, for the part, albeit mostly insignificant, is of so totally different an order from that of those Dickens-portraits which have brought to this most sterling actor his latest fame that the faultless and grave care with which he goes through the poor task is only another proof of his good claim to be ranked very high in his profession. It gives added value to the fine things he has done before. FREDERICK WEDMORE.

A VERSION of *Bleak House*, different from that in which Miss Jennie Lee has acted so successfully, is announced for production at the Globe this evening. Miss Lee will afterwards return to the theatre with the version to which she has accustomed the public. This will be under the management of Mr. Edgar Bruce.

WE regret to announce that the Duke of Meiningen has now finally decided *not* to send his dramatic troupe to England next year.

Abel Druce, Mr. Gilbert's new play for the Haymarket, will be produced there on the re-opening of the house early in September. Mr. Hermann Vezin will act a principal character, and Mr. Howe and Miss Marion Terry will appear in the piece.

THE re-opening of the Court Theatre on September 9, by Miss Helen Barry, is already largely announced. The experiment of a drama which promises to be sensational being acted in a little playhouse hitherto devoted to the airiest comedy will at all events be a curious one.

MR. IRVING is about to appear at Manchester, after a holiday of unusual length.

M. PAUL FERRIER has read to the actors at the Gymnase a three-act comedy to be called *Compensations*. The piece had already been accepted at the Théâtre Français, from which, however, it was by arrangement withdrawn. M. Saint-Germain, the admirable comedian, will now appear in one of the chief characters, and he will be supported by Mlle. Jeanne Bernhardt, the younger sister of the celebrated actress, and by Mlle. Dinelli, who brings from the provinces as good a reputation as youth can acquire.

PREPARATIONS are being actively made by M. Ballande for the opening of the "third Théâtre Français," for which purpose, as our readers have been told, he has taken the Théâtre Déjazet. No one has done more than M. Ballande has already done at his morning representations to encourage a new dramatic literature in France, and it is of course his intention to give, at his new theatre, every possible chance to the young and unknown writers. Aware of this, they are already taking advantage of him. In one month of preparation he has received between two and three hundred manuscripts; and he has taken upon him a task which the most active of London managers would certainly shrink from—the task of recording with each piece which he refuses his reasons for refusing it. Manuscripts therefore come up to M. Ballande somewhat in the light of examination-papers, and he bids fair, if he continues his method, to establish a school of dramatic writing as well as of acting. The beginning of October is the time fixed upon by M. Ballande for opening the "third Théâtre Français," as to which we shall then probably speak from personal observation.

M. THÉODORE BARRIÈRE, one of the most prolific writers for the stage, is busy in editing his *Théâtre complet*. Each piece is to have a preface, and, as there are more than a hundred pieces, his task is not a light one. M. Barrière may be said to be in reality writing his reminiscences of the theatre, of the actors and authors with whom he has worked.

M. SARDOU is making his arrangements for the winter. He has not yet, it is said, given names to the pieces he has promised for the Vaudeville and the Porte Saint-Martin, but the pieces themselves are in a very forward state. The first, for the Vaudeville, is a five-act comedy-drama (as they now style it)—a study of modern manners, of the nature of the *Famille Benoiton*. The chief character has been written for Mlle. Blanche Pierson. The hero of the piece for the Saint-Martin is to be acted by Dumaine.

EVEN a manager active and keen as M. Montigny of the Gymnase is not above the managerial weakness of trying to make a second success out of exactly the materials that have produced a first. Thus *Le Salon au Cinquième Etage* now played at the Gymnase is played as the result of the success last summer of the *Galerie du Prince Adolphe*. Both are slight pieces which exist for the sake of introducing *tableaux vivants*—of "realising," as the English word is, the pictures that have appeared at the Exhibition. The little piece itself is of course not without satire; the critical opinions of a Prudhomme of the provinces, the art-critic of the *Echo of the Dubs*, giving some amusement. He is a critic who has admired

little since the work of Horace Vernet and the great school, and he finds himself at issue with most of the things that are highly thought of today. Malard plays the part gaily, and the literary framework of the *tableaux vivants* is beyond doubt laughable. But it is perhaps a mistake to have so closely repeated a success of last season, and it is certainly a mistake to have introduced for the most part pictures little noticed, and to have omitted for the most part the pictures that were talked about. The piece is of a kind that affords admirable opportunity for the introduction of one of the best and subtlest "puffs" enumerated by Sheridan, and there are practitioners of modern art who are by no means inappreciative of the use of such advertisement.

M. JOUAUST has just published the first volume of the selected works of Regnard. There are many editions of the comic poet, but this is distinguished in the first place as forming part of a collection—*Nouvelle Bibliothèque Classique*—and in the second as being at once a cheap book and a luxuriously printed one. The volume of Regnard now issued is the first of two, and it includes the *Joueur* and the *Distrain*—two pieces which the Comédie Française may probably take up. In the *Distrain's* leading character Delaunay, it is conjectured, would be excellent. Paul Deshayes played it a dozen years since at the Odéon. The *Retour Imprévu*, which concludes the volume, reminds the reader that Regnard was the Labiche of his generation.

MUSIC.

WAGNER'S THEATRE.

Bayreuth: August 12, 1876.

It is by no means easy to give any clear account of the preparations for the great festival which commences to-morrow, in the midst of such general excitement as pervades the entire town of Bayreuth. At ordinary times it must apparently be a quiet enough, old-fashioned German town, clean and less malodorous than many, very pleasantly situated, with the picturesque old gables of the houses turned toward the street. At present, however, if old it is certainly anything but quiet; and at almost any hour after 7 A.M. the streets remind one of Rotten Row in the afternoon. It is not only the number of people to be met which renders the place just now so exciting. Greater crowds have often been seen at musical gatherings in London; but probably never in the whole history of the art has such a representative assemblage of musicians been brought together. There seems, unfortunately, to be no such institution here as a "visitors' list," and I am therefore unable to name more than a few of those who are here. First must certainly be mentioned Franz Liszt, one of Wagner's earliest and most ardent adherents. It was he through whose instrumentality *Lohengrin* was first heard in Germany; and it was therefore only appropriate that he should assist at the first representation of the great work which develops to their full extent the theories of which *Lohengrin* may be regarded as the first exposition. Here also are Edvard Grieg, from Norway, and Peter Tschaiikowsky, from Moscow—both of whom will be known, at least by name, to the readers of the ACADEMY. Of musical critics the number present, as may be imagined, is very large; there is probably hardly a German writer of any eminence but is either already here or will be here before to-morrow afternoon. England will be fairly represented. Of our musical reporters, those of the *Times*, *Daily Telegraph*, *Standard*, *Examiner*, *Guardian*, and *Weekly Dispatch* are, I understand, already in Bayreuth, and I am informed that the musical critic of the *Athenaeum* will come next week for the second performance; while among musicians from England not connected with the press are Sir Julius Benedict, Mr. G. A. Osborne, Signor Randegger,

Mr. Dannreuther, Mr. Walter Bache, and others too numerous to mention. On the other hand, there are some musicians, both German and English, whose non-appearance here is a cause for some little surprise. Dr. Ferdinand Hiller is so thoroughly a disciple of the old rather than of the new school that his absence will probably astonish nobody, as it is well known that he has but little sympathy with Wagner; but one might have reasonably expected that such men as Anton Rubinstein, Johannes Brahms, and Joachim Raff (none of whom will, I understand, be present) would have attended to do honour to their distinguished brother in art. It is a cause for regret also that two of our best English musical critics—the representatives of the *Daily News* and *Morning Post*—should be conspicuous by their absence. Yet, after all deductions are made, it may safely be asserted that no such audience has ever been assembled within the walls of a theatre as that which during the coming week will witness the first performance of what the Germans most appropriately describe as an "epochmachendes Werk."

The warm interest which the King of Bavaria has taken from the first in Wagner's project is well known. Unfortunately, his Majesty has such a morbid dislike to publicity that the hopes which were expressed that he would attend the first performances will not be realised. He has, however, been present at the beginning of this week at the last full rehearsals of the *Rheingold* and *Walküre*; and (as was announced some little time since in the English papers) he has written an autograph letter to the German Emperor inviting him to attend. His Imperial Majesty has accepted the invitation, and arrived here this afternoon shortly after five o'clock amidst very hearty popular demonstrations. Among other distinguished visitors who have arrived or are expected are the Grand Duke of Weimar, Prince William of Hesse, the Grand Duke and Duchess of Baden, the Grand Duke of Mecklenburg, Prince Vladimir of Russia, and the Emperor of Brazil.

That the inhabitants of Bayreuth are fully alive to the importance of the occasion is evident from the festive appearance of the town. Even in the smaller streets there is hardly to be seen a single house which is not decorated with flags and garlands, while to-day workmen have been busily planting rows of trees along the principal thoroughfares, thus adding much to the picturesqueness of the scene. In all the booksellers' shops in the town the counters are loaded with books of every conceivable size and style, but all upon the same subject—the "Ring des Nibelungen." Within the last few weeks there have been at least a dozen works published, either on the old "Sage," or on Wagner's treatment of the same; and the study even of the chief only of these treatises would involve a larger expenditure of time than is possible at present.

This morning I took the opportunity of walking up to the theatre to see what I could of its external and internal arrangements. In his choice of a site it must be allowed that Wagner has shown a true poet's instinct. The building is situated on the side of a hill about half a mile outside the town. The platform in front of the building commands a lovely view. In the foreground is the town of Bayreuth, and beyond is a beautifully undulating and well-wooded landscape, bounded by the gray heights of the Fichtelgebirge. The exterior of the theatre is of the plainest possible description, of red brick, in no way striking in design, but constructed with the greatest regard to convenience, there being at least ten entrances to the auditorium. On passing through one of these, we come at once into what would in ordinary theatres be called the pit, but may more accurately be described as the amphitheatre. Wagner's theatre differs from all others in that it contains no tiers of boxes, and no gallery in the ordinary sense of the term. This peculiarity

of construction has arisen from the fact that in order to increase the scenic illusion Wagner has resolved that his orchestra shall be entirely invisible to the spectators. The instrumentalists are therefore placed so far below the level of the stage as to be quite unseen from the pit. It would, however, have been impossible to preserve this arrangement had the customary tiers of boxes been retained; they have, therefore, been altogether dispensed with, and the house may be said virtually to consist of pit only. This pit, or amphitheatre, contains thirty rows of seats, each so far raised above that in front as to afford to every spectator an uninterrupted view of the stage. Behind these seats is the Royal box, which contains accommodation for one hundred persons, and over the box is the gallery for the holders of free tickets, which is so far removed from the stage, and so little raised above the level of the pit, that the orchestra is no more visible than in the rest of the house. There are no seats of any kind at the sides of the theatre.

Though the whole building will accommodate only 1,650 spectators, it must not be imagined that the house is a small one. The amphitheatre contains 1,345 spacious seats, and the auditorium must therefore be considerably larger than that of either Drury Lane or Covent Garden. What will be the acoustic effect of the invisible orchestra it is difficult to say without hearing it. Through the courtesy of one of the officials of the theatre, Herr Krapf, I was allowed to enter the orchestra, and examine the arrangements for myself. The floor is sunk several feet below the level of the stage, and also extends beneath it for some little distance; the hinder walls are, so to speak, concave reflectors which throw the sound forward towards the audience. Herr Krapf also took me over the stage, and through the property-rooms; and it was very evident, even from a necessarily very cursory examination, that the *mise-en-scène* of the work will be of the most remarkable kind.

It may help my readers to form some idea of the enormous labour which the preparation of the music has involved to say that with the exception of an occasional day's rest, the rehearsals have been in active progress ever since June 3. In the preliminary rehearsals the wind instruments were first taken by themselves, then the strings by themselves, and afterwards the full orchestra alone. Each scene was meanwhile twice practised by the soloists with piano, and then lastly, the voices and orchestra were tried together. These preliminary rehearsals alone lasted till July 12, and then succeeded others, with more and more completeness of stage effect, up to within the last few days. The final rehearsals came to an end on Wednesday, three clear days being allowed for rest before the first performance. Those who have been present at these rehearsals speak in the highest possible terms of the perfection of the orchestral playing. On this, however, some remarks can be made next week.

It will be hopeless to attempt any notice in this number of the performance itself, because it will not conclude till Wednesday, and the work is pre-eminently one which must be judged as a whole, and not in isolated portions. I shall therefore conclude this notice by giving the complete cast of the work for the four evenings:—

1. *Das Rheingold*.—Wotan, Herr Betz; Donner, Herr Gura; Froh, Herr Unger; Loge, Herr Vogl; Alberich, Herr Hill; Mime, Herr Schlosser; Fasolt, Herr Eilers; Fafner, Herr von Reichenberg; Fricka, Frau Sadler-Grün; Freia, Fr. Haupt; Erda, Frau Jaide; Rhine-daughters, Fr. Lilli Lehmann, Marie Lehmann, and Lammert.

2. *Die Walküre*.—Siegfried, Herr Niemann; Hunding, Herr Niering; Wotan, Herr Betz; Sieglinde, Fr. Schefzky; Brünnhilde, Frau Materna; Fricka, Frau Sadler-Grün.

3. *Siegfried*.—Siegfried, Herr Unger; Mime, Herr Schlosser; The Wanderer, Herr Betz; Alberich, Herr Hill; Fafner, Herr von Reichenberg; Erda, Frau Jaide; Brünnhilde, Frau Materna.

4. *Götterdämmerung*.—Siegfried, Herr Unger; Gunther, Herr Gura; Hagen, Herr Siehr; Alberich, Herr Hill; Brünnhilde, Frau Materna; Gutrune, Fr. Weckerlin; Waltraute, Frau Jaide; the three Norns, Frau Jachmann-Wagner, Fr. Schefzky, and Frau Sadler-Grün; the three Rhine-daughters, Fr. L. and M. Lehmann, and Lammert.

The chorus in *Götterdämmerung* consists of twenty-eight male and ten female voices, and it is characteristic of the enthusiasm of the principal performers for their work that such men as Vogl, Eilers, Reichenberg, and Niering have volunteered to sing in the chorus, to add to the general effect.

EBENEZER PROUT.

It is arranged that the second Silesian Festival shall be held on July 8, 9, and 10 next year, at the same place as on the first occasion (Hirschberg), and with the same soloists and conductor. The programmes will include the oratorio *Samson* and Beethoven's ninth symphony.

The story of "Francesca da Rimini" supplies the groundwork of the plots for three operas by composers of different nationalities: the subject being treated in German by Götz, in French by Ambroise Thomas, and in Italian by Cagnoni.

THE *Musikalisches Wochenblatt* states that Giulio Ricordi, formerly publisher in Milan, has been invested with the order of Charles III. by the King of Spain, in consideration of his services rendered to the Musical Conservatoire at Madrid.

Le Baiser is the title of a new opera written by Félix Pardon, the Belgian composer.

A SERIES of four Chamber Music Concerts will be given at the Langham Hall by Herr Hermann Franke in October and November next. The programmes will consist chiefly of new compositions by Brahms, Rubinstein, Raff, &c.

EMANUEL CARRION, the well-known tenor, died at Milan on July 24 last.

No. 225, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The History of the Norman Conquest of England. By Edward A. Freeman, M.A., &c. Vol. V. (Oxford: Clarendon Press, 1876.)

MR. FREEMAN'S fourth volume brought the tale of the Norman Conquest to its natural end with the death of the Conqueror; the fifth and last traces its influence on "our laws and constitution, our social and religious history, our language and our architecture." To do this effectually, it was necessary to give some account of William's successors; and, accordingly, the history is carried on as far as the time of Edward I., when "the Angevin King, the Norman baronage, the English commons, had forgotten that they sprang from three stocks which had once been such deadly enemies," and every outward sign of foreign conquest had finally disappeared. This history, forming the narrative portion of the volume, as distinguished from the chapters in which the political and other effects of the Conquest are severally discussed, easily divides itself into two periods, including respectively the reigns of the Norman and the Angevin kings. As, however, the author confines himself throughout almost entirely to such matters as bear upon his immediate subject, and the relations between Normans and Englishmen, even the earlier and more fully treated period is not given in anything like the same detail as the reigns of Edward the Confessor, Harold, and William the Conqueror. Although, therefore, within its proper scope the volume is no less characteristically exhaustive than its predecessors, it is satisfactory to learn that the author himself regards it as "in some sort provisional." The fulfilment of his expressed intention of treating more at length the reign of William Rufus will be looked forward to with the keenest interest, and with the hope that he will be enabled to continue his invaluable labours at least to the end of the Norman period.

Before entering upon his masterly sketch of the character and reign of Rufus, Mr. Freeman fitly devotes a chapter to the great Survey, the immense importance of which to the historian he was the first to adequately recognise. Among the endless purposes which Domesday serves as the record of the most direct and immediate result of the Conquest, the settlement of the Normans in England, not the least valuable is that it incidentally enables us better to understand those results which were more complex and remote. The spirit of legal fiction, which

makes itself so conspicuously prominent on every page of it, primarily illustrates the system of outward formal legality with which the actual Conquest was carried out; but, beyond this, it goes far to account for that continuity of English history in general which is the great lesson Mr. Freeman has set himself to teach. How far the Conqueror, with all his political sagacity, really looked beyond his own interests in assuming himself to be the legal successor of Edward the Confessor, it is impossible to say, but it is certain that

"the course of our history at home and abroad, for the last eight hundred years, has been the direct result of the fact that our Crown was claimed and won by a foreign prince, who gave himself out as the lawful heir of England, but who had to cut his way to the English throne by the help of the swords of strangers."

In so far as this claim brought the Conquest about, it was the source of the darkest temporary evil; but its subsequent effect on the destinies of the nation was distinctly beneficial. If under cover of it, and the confirmation it received by his election by the Witan and consecration by Ealdred, the Conqueror was enabled with some show of outward legality to treat all who opposed him as rebels, and all the soil of England as forfeited to the Crown; on the other hand, it was because he professed to be king, not by conquest, but by regular succession and election, that it became his object to preserve intact, as far as circumstances would allow, the old English laws and institutions upon which his supposed rights were grounded. Fortunately, too, the fiction served him equally well in his relations with his own followers. He still had to reward them; but it made a real difference, as between grantor and grantee, that the lands transferred from English to Norman holders were formally regarded, not as the spoils of a joint conquest, a share of which might be claimed by right, but as the strictly personal property of the king, to be bestowed at will upon those who had earned his gratitude by aiding him in its recovery. And this leads to the great question, how far William can be said to have introduced into England the so-called Feudal System. Mr. Freeman's arguments on this point, which are expressed with singular clearness and force, tend to show that with regard to feudalism, as in so many other respects, the effect of the Conquest was mainly to further and strengthen pre-existing tendencies, and not to introduce a new element into the national polity. But, although the system of tenure by grant from a lord was no innovation, the impulse it received at the Conquest was enormous. What before was partial and incidental assumed a totally different character when all lands whatever in lay possession were taken into the king's hands and partitioned out in new grants either to the former owners or to Norman strangers. After this "there was no longer such a thing as an *edel*; all was bookland, bookland, too, held only by the actual gift of the reigning king or by his confirmation of some earlier gift." Viewing feudalism, however, in its political aspect, William's legislation was as distinctly anti-feudal as it well could be. The single act, by which

at the famous *Mycel Gemot* on Salisbury Plain he required, as common overlord, not only the tenants-in-chief, but every freeman through the descending scale of under-tenancy to plight him personal fealty, cut at the very root of the feudal principle that the allegiance of the under-tenant was due, not directly to the head of the State, but only to his immediate lord. Wherever, as in France, this pernicious doctrine obtained, its fruit was seen in a weak central Government and more or less chronic anarchy. By checking it, by refusing "to sink from the national king of the whole nation into the personal lord of a few men in the nation," William opposed feudalism in one direction as much as he had promoted it in another. Even as a form of land-tenure, however, as Mr. Freeman points out, feudalism under the Conqueror lacked what was afterwards its most distinctive feature. Neither in Domesday nor elsewhere is there a trace in his reign of land being held directly on condition of military service. The fact, therefore, that, only thirteen years after his death, in the charter of Henry I., the existence of military tenures, with their concomitant obligations of wardship, marriage, and relief, is taken for granted suggests the obvious inference that they came into existence in the time of William II. Mr. Freeman, indeed, following Mr. Stubbs, goes farther than this, and sees in the organised system of oppression, into which feudalism had developed, evidence of the logical deductions and unscrupulous craft of a single mind, that of the notorious Flambard. Thus the conclusion to which he leads us on the whole question is that, so far from William the Conqueror being the introducer of the feudal system, "it would be more accurate to say that all that we are really concerned with—that is, not an imaginary Feudal System, but a system of feudal land-tenures—was not introduced into England at all, but was devised on English ground by the malignant genius of the Minister of Rufus." On this question we shall doubtless hear more when Mr. Freeman returns to the reign of William II.

Another theory, that the Conquest resulted in a deliberate substitution of Norman in place of English laws, is shown to be equally unfounded:—

"The way in which the law, or rather custom, of Normandy really affected the law of England was of quite another kind. Few or no new institutions were substituted for old ones, but several new institutions were brought in alongside of old ones. . . . Our institutions, in short, are in no sense of Norman origin, but they bear about them the trace of deep and abiding Norman influence. The laws of England were never abolished to make room for any laws of Normandy: but the laws of England were largely modified, both in form and spirit, by their administration at the hands of men all whose ideas were naturally Norman. . . . During the reigns of the two Williams and of Henry the First, the old laws went on, whatever might grow up by the side of them. The law was still the law of King Edward, with the amendments of King William."

Nor did the anarchy of Stephen's reign really break the continuity. For, although the great Angevin lawgiver, for whose work it cleared the way, was an innovator, he was no more a destroyer than the Conqueror

himself, or than his own grandfather, Henry I., with whom, by the way, Mr. Freeman most instructively compares and contrasts him. His claim to be called the founder of modern English law is perfectly just; but it rests, not so much upon the new and apparently foreign elements which his legislation introduced, as upon the fact that he gathered up and systematised the old laws and customs, reconciling them where they were discordant, and adapting them to the changed circumstances of a time when, by the silent drawing together of Normans and English, it was possible to legislate for a united people.

As with the laws of England, so too with the *Witanagemot*, its National Assembly. After the Conquest, seemingly as a matter of course, the meetings of the Witan still went on without a break. When three times a year the king wore his crown and gathered round him his *Magnum Concilium*, it was but a *Mycel Gemot*, under a new name, but attended by the same class of members and with the same deliberative functions. But here again, although there was continuity, there was silent and gradual innovation. Thus even so early as the *Salisbury Gemot* Mr. Freeman sees the germ of the two modern Houses of Parliament in the distinction between those who were summoned personally and those who were summoned in a body. In the Great Charter of John these two classes, the Witan and the Landsittingmen, reappear, with the same distinction, as the Prelates, Earls, and greater Barons, and the King's tenants-in-chief; and there can be little doubt that, as the Lords are the direct successors of the former, the latter, as personal attendance gave place to representation, are to be recognised in the Knights of the Shire. But the greatest change effected by the Conquest in the constitution of the Assembly, one which carried with it, too, most important changes in its spirit and working, was the change in the nationality of its members. Least of all, however, was this the result of any law excluding Englishmen; for it naturally and silently followed the gradual transfer of the greatest estates and offices to Normans.

"At the beginning of William's reign the inner circle of the Assembly, those whose attendance was habitual, the Witan, as distinguished from the Landsittingmen, were a body of Englishmen, among whom a few places here and there were filled by strangers. By the end of William's reign, without any formal enactment, without any sudden change, they had become a body of strangers among whom a few Englishmen kept their places here and there. . . . But here again time did its work. Without any formal enactment, without any change of established custom, the Assembly of foreigners changed back again into an Assembly of Englishmen. As the distinction of Norman and Englishman was forgotten, places of honour and authority were again opened to men of Old-English birth, and the descendants of Norman conquerors and settlers gradually became as truly English as the men of Old-English birth themselves."

Although Mr. Freeman characterises the Angevin period as especially the period when this fusion was effected, the process, as he shows, had begun long before. In one of the invaluable appendices, in which, as in the previous volumes, special subjects are exhaustively worked out, the notion, so

eloquently elaborated by Thierry, that for generations after the Conquest there existed a strongly-marked antagonistic distinction between Normans and Englishmen is conclusively disproved. In spite of arguments drawn from rhetorical passages of Henry of Huntingdon and others, the truth seems to have been that, when once the bitterness of the immediate conquest was past, "whatever distinction was drawn soon became a distinction of rank and not of race." And between the highest class of Normans and the lowest class of Englishmen—that class of *villains*, namely, in which *ceorl* and *theow* were confounded—there were important classes in which almost from the first the two races must have been largely intermingled. In these classes, among the small landholders and traders, the fusion was doubtless proportionately rapid, as common class-interests were sure to develop themselves; and in the towns especially, according to the unimpeachable evidence of Orderic, Normans and English were already in the time of the Conqueror living peaceably together, and, what is still more important, had begun to intermarry. In the next generation the ameliorating effects of time were at once more powerful and more extended, with the natural result that "the Norman settled on English ground, holding his estate by English law, not uncommonly the son of an English mother, soon came to look on himself and to be looked on by others as English rather than as Norman." Thus the work had really advanced far towards completion before the end of the Norman period; and the policy of Henry I. especially (not so much, however, by any special favour shown to his English subjects, or by any such direct action as is attributed to him in a remarkable passage by Walter Map, as by the despotism which reduced Normans and Englishmen of whatever rank to a common level of subjection to the royal authority) is credited by Mr. Freeman with having done more than anything else to blend the two races together. How the personal character and position of each of Henry's successors, and every event of their reigns, tended silently and surely to carry on the work till the Great Charter of John and the Parliament of Edward I. gave the noblest evidence of its absolute completion is admirably traced out by Mr. Freeman in the latter part of the volume. His enthusiasm over the perfected union and the advent of a king, in the person of Edward I., who in feeling as in name was wholly English, is, however, not unalloyed. As the one exception to the ultimately beneficial results of the Conquest in every other respect, politically and socially, its effect upon the English language he considers to have been "purely evil." His lament over "the abiding corruption" of the English tongue by the strong infusion of Romance will probably appear to many to be too strongly worded; but the whole chapter on language and literature is pregnant with interest and deserves the most careful study. We have no space, however, to do more than direct attention to it, as well as to the equally interesting chapter treating of the effects of the Conquest on architecture, a subject on which Mr. Freeman speaks with the authority of long ex-

perience and unrivalled critical knowledge. To do, indeed, anything like justice to a volume of this kind, each main division of which involves within it a multitude of subordinate subjects, is well-nigh impossible within the limits of a single review. Like the volumes before it, it contains a mass of information that is really prodigious; while it exhibits the author's learning and vigour, his scrupulous accuracy and fearless independence, if possible, even more conspicuously. From every point of view, in short, it forms a fitting conclusion to a work which, if it has not entirely superseded the brilliant compositions of Thierry and Palgrave, is more indispensable to the student than either as the standard history of the all-important period of which it treats.

GEO. F. WARNER.

BARNABEE'S JOURNAL.

Barnabae Itinerarium; or, Barnabee's Journal. By Richard Brathwait, A.M. With a Life of the Author, a Bibliographical Introduction, and a Catalogue of his Works, by Joseph Haslewood. A New Edition, by W. Carew Hazlitt. (London: Reeves & Turner, 1876.)

It requires an ample digestion and not too sensitive appetite to enjoy all the collected editions of old minor poets which are foisted upon us so abundantly nowadays. Not every learned and laborious editor knows how to select the object of his researches, and the little circle for whom he caters does not like to blame his taste for fear of checking his ardour. We have almost, however, reached the limit of endurance with regard to "complete works" of seventeenth-century versifiers. There is much, doubtless, to be wished in the form of handy and cheap editions; there are one or two notable lyrists still uncollected, such as Lodge and Stanley; but, speaking roughly, there are no longer any non-dramatic poets of that period at once of intrinsic value and inaccessible to the student. There is now the dread upon us of having to make room upon our shelves for the poetasters. Already the garrulity and rubbish of John Taylor, misnamed the Water Poet, has been magnificently collected and reprinted; and we are in daily expectation of a circular announcing a reprint of the entire works in prose and verse of poor old lamentable Churchyard. While thus we "buy at vast sums the trash of ancient days," we leave it for posterity to judge whether the antiquarian interest this generation shows in poetic matters is or is not a mere fashion, and guided by tradition more than taste. Among the poetasters of the Elizabethan age Richard Brathwait was not the least obscure; but he wrote one book, out of forty-seven, which has attained a distinct celebrity as a work of humour. Oddly enough this dreary Brathwait, as very a "poor sixpenny soul" as ever lived, inspired the late Mr. Joseph Haslewood with an absorbing enthusiasm. The result was the learned bibliographical monograph, in the midst of which runs a slender stream of text, which Mr. W. C. Hazlitt has once more reproduced in the volume before us. The book, however, is to be praised as highly as the "complete

editions" above spoken of are to be blamed, in that it inflicts but one, and that the best, work of its author upon us, with such a biography and study as suffice to satisfy all possible curiosity about the author. So, if at all, but only so, should these poetasters be reprinted.

Richard Brathwait was born, as it is believed, near Kendal, in 1588. He died at Catterick on May 4, 1673, being therefore in existence from the prime of Spenser's life until after the birth of Addison. He became a commoner of Oriel College, Oxford, in 1604, and, if we may believe his own words, about that time began the work that he was all his life polishing up, the *Barnabae Itinerarium*. Removing afterwards to Cambridge, he became a pupil of Lancelot Andrews, but distinguished himself more as an inveterate lover of dissolute company than as a student or a thinker. He married in 1617, became the captain of a foot-company of trained-bands, deputy-lieutenant of the county of Westmoreland, and a justice of the peace. The only other noticeable fact of his life was that he became the father of the gallant and unfortunate Sir Strafford Brathwait, who died fighting the Algerines. His works range from *The Golden Fleece*, published in 1611, to a sort of commentary on Chaucer, which appeared in 1665, and thus his literary life embraced more than half a century. His serious poems, elegies, odes, madrigals, and the like, are unredeemed dulness, the very flattest ditch-water imitations of such rare poets as Breton and Daniel; but he had a genuine vein of boisterous humour, and this gives some doubtful value to a few vivacious pieces. The *Barnabae Itinerarium*, however, is worthy of rather more definite praise than this, if only on the score of its novelty and oddity. It was printed in Latin and English, in a six-line rhymed stanza, the Latin on one side, the English on the other. As a feat of versification the English version is distinctly remarkable, being written throughout in double rhymes. The meaning is usually more obvious and expressed more naturally in the Latin, and one may therefore surmise that this is the original text. The poem is divided into four books, each describing a distinct journey, and each probably composed at a different part of the author's life. All are ribald, but the first and youngest is peculiarly profligate and reckless. Inasmuch as we may take the recital as being autobiographical, it gives us the undisguised portrait of the poet as a drunken ruffian. Praise of liquor is the great inspiring theme, and he worships Bacchus with the fervour of a devotee. "Jamais homme noble ne hayst le bon vin: c'est ung apophthegme monachal," says somebody in *Gargantua*, and Brathwait might have taken this axiom as his text.

"This way, that way, each way shrunk I,
Little eat I, deeply drunk I,"

he says, and his *Itinerary* is distinctly unedifying. Unamusing it is not. On the threshold we meet with a famous morsel of burlesque:—

"In my progress travelling Northward,
Taking my farewell o' the Southward,
To Banbury came I, O prophane one,
Where I saw a Puritane one,
Hanging of his cat on Monday
For killing of a mouse on Sunday."

At Nottingham he finds highway riders still imitating the great deeds of Robin Hood and Little John; at Wakefield he is disappointed not to meet with the veritable Pinner, George-a-Green:—

"Veni Wakefeeld peramoenum,
Ubi quaerens Georgium Grenum,
Non inveni."

At Ingleton, some women threw half a brick at him, in quite the modern manner. At Hodsdon he is prevailed on to play cards with some coney-catchers, who fleece him of everything; he has them up before a justice, but he is only jeered at for his pains. At Wansforth Briggs he has an odd adventure, which he thus recounts in his terse fashion:—

"On a hay-cock sleeping soundly,
Th' river rose and took me roundly
Down the current; people cried;
Sleeping, down the stream I hid;
'Where away,' quoth they, 'from Greenland?'
'No! from Wansforth Briggs in England!'"

His constant complaints of the accommodation he meets with are pathetic:—

"Inns are nasty, dusty, fusty,
Both with smoke and rubbush musty."

These quotations do not give an unfair idea of the best humour of a poem that never drags or becomes dull, but which is generally indecorous and always doggerel. It does not belong to literature at all, but it deserves a place in every library that admits what is dedicated to whimsical humours.

EDMUND W. GOSSE.

Holidays in Tyrol. Kufstein, Klobenstein, Paneveggio. By Walter White. (London: Chapman & Hall, 1876.)

TWENTY years ago, as he reminds us in his preface, Mr. White published a little volume entitled *On Foot through Tyrol*. At that time the Eastern Alps beyond the few valleys traversed by the high roads to Italy were strange to the English public. Now, when Mr. White speaks of the region he describes as "comparatively unknown," the expression, though justifiable if the comparison is with the Oberland or Zermatt, strikes us at once as somewhat forced.

It is true that the programmes of our travelling agents do not as yet recognise the attractions of South Tyrol; but in other literature they have been adequately dwelt upon. After Gilbert and Churchill's charming volume, and Mr. Ball's exhaustive Guide, it is difficult for later writers to plead seriously the novelty of their subject. The names which head Mr. White's chapters are mostly familiar to the readers of Alpine books. It is not, however, as a discoverer of unknown valleys that he comes forward. He seldom, taking his map as guide, penetrates into the side glens, far from roads and pensions, in which the Dolomites often conceal their most characteristic scenery. Nor does he yield to the fashion of the day, and seek incident by climbing peaks and passes. He disbelieves in beauty near the mountain-tops—except one or two he has visited himself—and has invented, accordingly, for his banner, a new motto, "Pulchritude better than Attitude" (*sic*), before which, if the strangeness of the device has any influence, "Excelsior" must surely go down. He is still faithful to the traditions of the time when Alpine travellers tested their

muscles by carrying weight instead of by scaling crags: in place of increasing the list of "New Expeditions," he has earned gratitude from many by the invention of a new knapsack-frame.

It is only by a rare exception that in this volume we are taken off a mule-path. Such a determined adherence to beaten tracks involves, I think, a certain incompleteness in the traveller's survey. Sometimes he misses the most noteworthy scenes, as when he passes round the Rosengarten, leaving unvisited the glens of Vajolet and the Tschaminbach, or stirs heedlessly past the mouth of Val Travi. In other cases he carries away an incomplete idea of the region visited. No one can thoroughly understand the Primiero country who has not gained at some spot the crest of the great rock-reef—it is only two-and-a-half hours' easy walk from a good inn—and thence told its towers and contrasted the desolation of the white table-land they enclose with the blue and purple glories of the world below. Mr. White refers to Mr. L. Stephen's walk up Val Pravitale with an expression of surprise that anyone should care to climb so far. If he will compare Mr. Stephen's vivid account of what he saw on that walk with his own experiences, he will, I think, admit that the toil was amply repaid.

Mr. White's habit of returning again and again to the same spot has gone far, however, to make up for some of the defects to which his want of enterprise exposes his book. He has at once an appreciative eye for the beauties of Nature, and a practised pen with which to describe them. We are, it is true, seldom arrested in his pages by a studied word-picture or a sketch which by a few touches leaves a vivid and distinct impression on our minds. But we feel throughout as if a pleasant and varied diorama of hills and forests was being unrolled behind the groups which fill the foreground. For it is rather as a *genre* than a landscape painter that he presents himself in this volume. He summons us to listen to "gossip over daily experiences." From an ordinary tourist such an invitation would be far from attractive. We know only too well the dull detail about dinners, inns, and insects, the perpetual flow of weather-foolish remarks, the repetition of a few conventional adjectives as to scenery which form the ingredients of most *table d'hôte* conversation. But our author is very far from being an ordinary tourist. He takes pleasure in travelling alone and finding his company among the people of the country, learning of their modes of thought as much as may be picked up in roadside encounters or round the inn fireside. He has thus gathered quite enough of South Tyrolese character and customs to make his book entertaining, and if, as each subject is touched on and dropped, he rather stimulates than satisfies curiosity, this was probably in his plan. Still, the slightness of treatment throughout the book seems carried to excess. One cannot help wishing that Mr. White had sometimes consulted other volumes than strangers' books. The omission by Miss Busk of the legends of central Tyrol left him an opportunity of which he might well

have taken advantage. Writing out of fuller knowledge, he would, I think, have given us a book of lasting value. As it is, we have to thank him for a collection of pleasant and lively sketches, which all who take an interest in the districts described may turn over with pleasure and profit.

Two or three important facts are very clearly indicated. First, we find that the Italians are slowly pushing back the German invaders into the Alps. At Brixen "Tyrolese become every year fewer as owners and more numerous as tenants." The dwindling of the German element is thus explained: "Your German-speaking Tyroler is slow and dull, likes to eat five times a day, and is easily outwitted by his active neighbour from the south, who eats moderately, but has an insatiable appetite for land, and knows how to captivate a German-speaking widow."

From the south, and to some extent together with the movement of races, liberal ideas are advancing. The peasantry are still, as a body, devoted to the Church and to Church-festivals, which they celebrate with all the good old rites of processions, petards, and beer-drinking. But the influence of the clergy is no longer unchallenged, even in remote valleys: at Innsbruck the Liberals are an influential minority; at Botzen they are in a position to be intolerant, and arches erected in an Archbishop's honour were lately pulled down, I believe, on the ground that permission for their erection had not been sought from the municipal authorities. Our favourable impressions of Botzen are considerably shaken, however, by the account of its "five Wine Factories," where red stuff is manufactured in thousands of gallons, and sold as wine.

Predazzo is an important village in Val Fassa, and Mr. White's description gives us a very fair notion of its inhabitants and their mode of life. In a country where a summer seldom passes without a village being destroyed by fire from heaven, it sets a good example by maintaining an efficient fire-brigade. Winter, when the men who have been earning money, some as labourers, some as *unternehmer* or gangers, come home, is the gay season. Then the theatre—a large barn—is open, with young men to personify the female characters.

"In February, 1875, a scriptural play—the history of Nebuchadnezzar—was acted in the Piazza. Snow lay on the ground, but the sun shone brightly, and in the clement temperature the people sat through the performance from noon till four o'clock on two successive days. Some of the incidents excited roars of laughter, particularly the representation of a little forest, in which the monarch was seen eating grass as an ox."

Primiero boasts a "Teatro Sociale," with boxes, pit, and gallery, and regular "subscribers;" but the performers are only life-sized puppets.

Kufstein, the first of the three places which figure on the title-page, is soon dismissed. Klobenstein, above Atzwang and under the Rittnerhorn, the panorama from which is given in the *Alpine Guide*, does not seem very attractive. It is cut off from the Dolomites by the deep trench of the Eisack, and the visitor's opportunities of imbibing fresh air are seriously interfered with by the tyranny of the German guests.

The solitary hospice of Paneveggio (5,160 feet), on the new road to Primiero, in the centre of a great forest belonging to the State, is Mr. White's favourite resort. Its situation is thus described:—

"Very striking is the scene that meets the eye every time you look forth from the stoop, or the balcony on the first floor.

"To begin with the tallest: leftwards rises the peak of the Cimon della Pala, with a consort of lesser height but greater breadth; both naked rock, reddish yellow, which looks lustrous at times in the sunshine. They peep over the topmost edge of the great forest through which we descended yesterday: a mighty slope of trees stretching down to the level of our resting-place and up the valley on the left, beyond the green shoulder of Giuribello, and down the valley on the right far as the eye can see. The height and breadth of that solemn expanse of wood invest the mountains that stand behind with a quality which they did not seem to possess when we could measure them with one glance from base to summit. We now imagine them higher than ever."

Of the paths and scenery of the neighbourhood, as well as of the inmates of the house, we have an excellent account. Mr. White tells us how he sang bass in the chapel choir, and how he dined with the "Wirth," and composed a song in many stanzas in honour of Paneveggio, which was duly sung at the hearth to the tune of "Yankee Doodle." The music was copied out for subsequent use in the church of Predazzo! The guest of the rustic inn was once disturbed by an Erzherzog and his Duchess, who had come to visit their neighbouring Alp, Giuribello; on another occasion, by the arrival of a band from Predazzo to celebrate the Emperor's birthday. It is amusing to hear that Garibaldi's hymn was sung up to the chapel door on this occasion. Such an incident is a singular proof of the liberality which has succeeded to the old harshnesses of Austrian rule.

I have said enough to show the kind of fare Mr. White offers his readers. *Holidays in Tyrol* makes no pretence to be a guide-book, but the practical information as to places which the author has himself visited is, so far as I can test it, uniformly accurate. Mr. White deserves special praise for the pains he has taken to go behind the too-often careless and arbitrary decisions of the compilers of the Austrian map, and to discover the names in use in the country.

Whether his respect for local usage is not a little exaggerated may perhaps be questioned. Native writers do not imitate the abbreviations common in the speech of the peasantry. They write Campidello, Castello della Pietra, San Pellegrino, not Campidel, Castel Pietra, Pellegrin: they would not, I think, turn the national hero into Garibald. Moreover, abbreviation may sometimes sacrifice meaning. "Boche" and "Venigia" standing alone are unintelligible. "Pian" or "Monte di Boche;" "Passo" or "Coston di Venigia," have a meaning for those who care to look for it. "Cozon" should be Coston (= French *coteau*), as in Costonzella; "Val-assa" (p. 154) is, as shown by the inscription quoted (p. 145), Vallazza, "the valley." The same inscription seems to prove that Valles, not Velles, has local sanction as well as that of the map. On p. 297 "Coston de di Venigia" and "Pala di San Martino," and on p. 255 "Passo di Cre-

nelli," are obvious misprints. I notice also several slips in the spelling of foreign words—e.g. "briefsammlung," "edelweis," "er-rärisch," and (p. 72) "strick" for strich. But as a whole the book has been carefully prepared and revised.

A route-map, useful as showing the position of the different valleys, accompanies the volume. Its value would have been greater if half the carriage-roads had not been left out.

DOUGLAS W. FRESHFIELD.

German Home-Life. Reprinted from "Fraser's Magazine." (London: Longmans & Co., 1876.)

HERE is another book about Germany and German home-life, but in this case one well worth reading. Not that the work is free from faults of exaggeration and a tendency to caricature, nor can the author be acquitted of a persistence in looking at the dark side of things. The more agreeable features of daily existence in Germany are steadily kept in the background, some are left out altogether, yet on the whole we have not had so valuable a contribution to our knowledge of Continental manners and customs for many years. The author's style, moreover, is lively, and she trusts mainly to her own experiences, which is a virtue seldom met with in writers of travel. Under the circumstances, *German Home-Life* is sure to find many readers, and, being a book with a *raison d'être*, is a decided novelty.

The subjects treated of are these:—Servants, Furniture, Food, Manners and Customs, Language, Dress, Amusements, Women, Men, Marriage and Children, Religion, the Church. The first three, to which may be added that of Dress, may be briefly dismissed. We have all the comfort on our side with regard to domestic arrangement generally, but the Germans have all the economy on theirs. This point must never be left out of sight. If our English households were regulated on German models they would be just as homely and devoid of anything like luxury. But the strictest economy—an economy which it is impossible to understand without personal observation—rules the German housewife. She has only a certain sum to spend upon the necessities of life, and it is eked out with an ingenuity, laboriousness, and good nature, quite unknown here. We find it detestable, for instance, that a young German lady kills the chicken we are bidden to partake of at her father's table; we find her washed stuff gowns and general appearance dowdy in the extreme; we compare the slatternly maidservants to our own tidy servants with disgust. If the young lady did not kill the chicken, she would be occupied in some other equally menial way; if she did not wash her stuff gowns, she would have to wear them dirty; and if slatternly maids were dismissed, no better could be had for the poor wages offered them. Thus the homeliness, the shabbiness, the hardships of ordinary domestic life are explained satisfactorily enough. Elegance, nay, comfort, are only to be purchased at a high price, and the large bulk of German society cannot afford a high price. Elegance

and comfort are to be found in German as well as English homes, but they are those of the rich or, at least, the *ditiores*. Admitting that middle-class life among our neighbours is less refined, less agreeable, more homely than among ourselves, it must also be admitted that it is less snobbish, less artificial, and, without a doubt, more honest. People do not try to appear better off than they really are, they are not ashamed of their narrow circumstances, they practise what in England would be called degrading little economies with a cheerful face. It is a necessity of daily life, and is no more rebelled against than the habitual servitude of the weaker to the stronger sex. And, after all, the very servitude of the women arises more from the necessities of the case than from want of chivalrous feeling. Englishmen are shocked beyond measure when custom compels them to remain seated in German drawing-rooms and be waited upon by the ladies of the house. Did it ever occur to them that they do this because they have neither footmen nor parlour-maids as is the case with us, and that they could not dispense hospitality at all if compelled to adopt more pretentious principles?

Thus, look at it whichever way we may, the simplicity, sordidness, or whatever else we may call it, so severely condemned by the author of this book, has a logical reason and a meaning. With the best intentions in the world, the mistress of a German home could no more remodel her household upon an English pattern than she could change her husband's income into that received by his insular neighbour in precisely the same position of life. The standard of comfort is reduced by inexorable necessity, if by nothing else.

With regard to hygiene it is not so, and it is certainly strange that the best-educated nation in the world should be sadly in the dark respecting soap and water. Even in France, you hear educated people calmly affirm that the mania for washing accounts for the prevalence of consumption in England, and that, like other hobbies, it will pass away. It is considered unsightly and indecent to suffer a wash-hand basin and jug to be seen. The toilette apparatus is made to shut up and look like something it is not, while to splash the polished floors with water would be desecration. Still, a German bedroom is worse off in these respects, and if the Frenchman uses soap and water scantily, the German uses it least of all. Ablutions in the proper sense of the word take place at rare intervals and in public baths.

But when our author treats of marriage and the effects of consanguinity, she brings such startling statements before us that we can only regret they have not been backed by facts and figures. The subject is too grave to be treated except scientifically and at length, which doubtless the author's wide experience would have enabled her to do.

"German physicians will tell you," she writes, "with jeremiads prolonged and sonorous, that the women of their country—the women of the upper classes, that is—are totally unfitted for the fatigue and duties of maternity. By inheritance, by education, by prejudice, by continued inter-marriage, by defective diet, poor nourishment, horror of exercise, hatred of fresh air and cold

water, the German lady has persistently enervated herself from generation to generation. Look at our prettiest girls, cried an eminent physician to me, they are like those flowers that bloom their brief hour, fade and fall to make room for fresh blossoms, who in turn will bloom, fade, and fall also. They are all *bleichsüchtig*, they cannot fill the functions that nature intended every mother should fulfil—not one here or there, but all; they have no constitution, no stamina, no nerve, no physique, no race."

And elsewhere she says:—

"In the upper classes marriage is determined, if not chiefly, yet decisively, by means. It is part of that peculiar prosaic, practical (and yet how fatally unpractical!) programme which seems the law of the modern German nature—that money, if in a family, shall not be allowed to go out of it. Hence, both in the case of gold and lands, marriages and intermarriages go on generation after generation, the relationships growing ever nearer and nearer, more and more confused; and the results, as may be readily imagined, ever more and more disastrous. In no other country does one meet with the same number of goitrous throats, scarred necks, spinal diseases, bad teeth, and generally defective bone-structure as in Germany."

And the following stories are given to bear out the statement:—

"In a family where cousins had intermarried with cousins apparently since the flood, the sole heir to a vast property was a delicate, spineless boy, a child whose bones had a cruel tendency to work their way through the skin, and so to slough away to the agony of the little sufferer. It was not possible that he should live, and when, after twelve years of terrible existence, death came and mercifully set him free at last, the childless father, looking round, picked out another cousin, took her to wife, and lived to have three more children, whereof two were grievously afflicted in body and mind, but the third, a hectic boy, survived to inherit the estate.

"In another family where the estates were considerable, and where the same immemorial marriage-customs between near relatives had obtained (uncles marry their nieces in Germany), the representatives of the last dwindled down to five. The son and heir blew his brains out; the second daughter drowned herself; the third became a confirmed hypochondriac; the second son, tormented with a terrible complaint (*Flechte*) akin to the leprosy of the ancients, after washing in all the waters that the wells of Germany afforded, unable to find even in religion and good works the consolation he sought, put an end to his miserable existence. Only the eldest daughter remained. The estates went in the male line and devolved upon a distant cousin, a mere *Namensvetter*, she said, but the old feeling prevailed; it was a pity to take her fortune away from her name, and when the *Namensvetter* proposed, he was accepted. I saw her some years later, she was a widow with one idiot child."

We repeat, such statements amount to nothing unless borne out by unquestionable evidence. Either this treatment of the subject should have been adopted, or it would have been wiser to say nothing at all. On the topics of Church and Religion we find some matter for thought, and throughout the whole volume plenty of entertainment, which is sure, nevertheless, and not without good cause, to affront our German neighbours.

M. BETHAM-EDWARDS.

History of Hertfordshire. By John Edwin Cussans. (London: Chatto & Windus; Hertford: Austin & Sons, 1876.)

THE man who undertakes the compilation of a County History enters upon no easy task,

and often a thankless one. There are so many persons who think that he might have done his work better, or that they could have done it better themselves, that in the end he usually finds what he regarded as his *chef d'œuvre* pretty much in the position of the fabled picture which cavilling critics had painted out altogether. That this is no random suggestion the results of a recent experiment will abundantly prove. The very work before us was selected as a test. The question was put to a dozen or more intelligent men, all of antiquarian tastes, and all more or less eminent in the various branches of archaeological science, as to which portion of the work they objected to, or would like to see omitted. The answers were as various as the subjects which they had made their special hobbies. One objected to the tabular pedigrees, another to the monumental inscriptions, a third to the lists of incumbents of the numerous parishes, a fourth to the biographical sketches of eminent persons of the county, a fifth to the documentary evidence concerning the descent of the manors, and others to the other peculiarities embraced in the work, until, after all the portions so denounced had been mentally erased, there was nothing whatever left of poor Mr. Cussans' book except the bare covers and a quantity of blank paper. As a matter of course, the converse result would have been obtained if each had been asked which particular feature of the work he would insist upon retaining to the exclusion of all the others. This experience fairly shows the true value of the hasty or careless criticisms of works which have involved the labour of years, and an expenditure of time and money for which no subscription lists are likely ever to afford an adequate compensation. Indeed, it may be safely asserted that none of the ponderous County Histories of the past have ever produced a pecuniary balance in favour of either their authors or publishers. And yet, what should we do without them? It is highly creditable to the enthusiasm and public spirit of such men as Nichols, and Ormerod, and Clutterbuck, and Hutchins, that they have cheerfully bestowed their time, and labour, and money, upon such vast literary enterprises, whose results remain as imperishable monuments to their memory; and those who now avail themselves of their researches should avoid, in very charity, the thoughtless comments upon their fancied shortcomings or excesses, so often flippantly made, because they sometimes fail to find in their pages what they want, or find a great deal which they do not want.

It is a subject for congratulation that the day is apparently over for the ponderous folios into which the earlier County Histories shaped themselves. It is somewhat trying to one's physical capacities, if one has frequently to consult such books as Nichols's *Leicestershire*, or Manning and Bray's *Surrey*, or Hoare's *Wiltshire*, or Clutterbuck's *Hertfordshire*. The editor and publishers of the new edition of Ormerod's *Cheshire* have wisely consulted the convenience of purchasers by greatly reducing the size of the volumes, so that one can handle them with some degree of comfort. Below the small folio, or royal quarto, it would be incon-

venient to descend, on account of the importance of displaying the tabular pedigrees on one page, or, at most, on opposite pages, and these sizes also afford ample space for the engravings, without which no County History appears to be complete. Mr. Cussans, in the work before us, has adopted the imperial quarto, perhaps the most desirable of all shapes for a history of this kind.

More than fifty years have elapsed since the publication of Clutterbuck's well-known *History of Hertfordshire*, which still deservedly takes high rank among similar works, and renders comparatively useless the former productions of Salmon, Chauncy, and others, as well as the minor topographical volumes confined to special localities. But Clutterbuck and his predecessors did not enjoy the facilities for investigation which are vouchsafed to archaeological students of the present generation, to whom are freely opened rich fields for original research which were either unknown to or else hermetically closed against them. The consequence is that, although Clutterbuck may be still accepted as a standard authority so far as he goes, it was high time that his great work should be continued or supplemented, his often incomplete details perfected, and the family history of the county brought down to the present time. Mr. Cussans did not propose a new edition of his valuable history, or a mere continuation of it, but it was impossible not to go over precisely the same ground. In doing so, however, he has, from sources not accessible to Clutterbuck, made most valuable additions to the manorial history of the county from the earliest period downwards, cleared up many doubtful points, and given original details concerning various subjects untouched or imperfectly treated by that writer. The same may be said as to the lists of incumbents and the monumental inscriptions. Clutterbuck's errors and omissions have been carefully corrected and supplied, and the occurrences of the last fifty years added, so that we have these important features of the work complete. Particular attention has also been paid to the heraldry of the county. Mr. Cussans has not thought it requisite, except in a few instances, to reproduce Clutterbuck's tabular pedigrees, which are readily accessible, to those who do not possess his volumes, at any of the public libraries, but has chosen instead to furnish those of other families which have come into note or become connected with the county since his time. These seem to have been constructed with great care, and are a valuable addition to the genealogical history of the county.

Mr. Cussans appears to have done his work conscientiously, and to have spared neither time, labour, nor expense to render his volumes worthy of ranking in the highest class of County Histories. The typography is entitled to unqualified praise, the paper, type, and illustrations being unexceptionable. He has, moreover, more than kept faith with his subscribers, for whereas he only engaged that each part should comprise seventy-two pages, the last two parts just issued contain double that number. Six more parts will complete the work, ten having already appeared.

The only questionable feature is the arrangement of the *History* in eight separate divisions, each treating of a distinct hundred, with separate paginations and indexes. It is difficult to understand how the complete work is to be bound so that it can be consulted with perfect convenience. We are promised, it is true, a general index, but it is doubtful whether it was worth while, for the convenience of the few persons who may care to purchase only the *History* of their respective hundreds, to adopt the system of Hoare's *Wiltshire*, issued in the same form, which has always been a standing grievance with those who are compelled to consult it. Still, with the work bound in three or four volumes, and the names of the hundreds displayed on the backs, with the proper references in the index, one need not lose very much time; and Mr. Cussans may perhaps yet hit upon some plan to obviate the only serious objection to his important undertaking.

JOSEPH LEMUEL CHESTER.

AUSTRALIA.

Sketches of Australian Life and Scenery. By one who has been a Resident for Thirty Years. (London: Sampson Low & Co., 1876.)

The Queen of the Colonies; or, Queensland as I knew it. By an Eight Years' Resident. (London: Sampson Low & Co., 1876.)

South Australia; its History, Resources, and Productions. Edited by William Harcus, Esq., J.P. (London: Sampson Low & Co., 1876.)

THE author of *Sketches of Australian Life and Scenery* preserves a strict incognito, and represents himself to be a medical man who, some thirty years ago, left England to seek his fortune in Australia; he settled himself among the gold-diggers in Victoria, and became what one of Miss Austen's heroines calls "an absolute old bachelor." From this state he is awakened by having to undertake the guardianship of two orphan half-nieces; one of these young ladies marries, and he himself becomes engaged, and so the book ends. We are assured in the preface that "although the names are fictitious, the scenes and facts may be relied on as correct, with no more variations than the few sentences required to connect the various incidents," and we marvel that any one can be found to inflict so uninteresting an autobiography on the public. The author's style is no better than the story; nevertheless it is impossible for one who writes after living thirty years in a colony not to have observed some things worth telling, and the reader who has patience to extract them will find a few interesting facts scattered through this book.

The author first sees Melbourne in its early days, and after many years returns to find it the splendid city it now is; yet he evidently has a lingering longing for the town he first knew, when good houses and huts of wattle and dab stood side by side, and tents were pitched in the main streets; when every one knew every one else; when the era of *at homes* had not arrived, and there were few dignitaries in Church or

State; when there were "a good English clergyman and a genial Roman Catholic priest, who might be seen walking amicably in Collins Street together."

The doctor tried gold-mining, but before any profits were made a sudden flood inundated his "claim," destroyed his machinery, and put an end to his speculations. He bears out what has been so often repeated, that thrift and industry prosper in Victoria as elsewhere, but there is no room for the idler or the drunkard—they had better remain at home than go to a country where there are fewer restraints and greater temptations.

The author describes the squalor in which Irish settlers live, and their wretched farming, in a very fertile part of the colony; their miserable huts, with a stagnant pool in front, the receptacle for all sorts of filth, are never free from fever:—

"Year after year the same exhausting crops are put in. The land gets no rest. Rotation of crops is not thought of. Manuring is neglected; what comes out of the soil is never repaid. If the present system of farming be not changed, it must end in destroying the productiveness of this most fertile portion of Victoria. The large land-owners see this; some who formerly let their property in farms have resumed it, laid down the land in grass, and put in sheep, to give it time to recover. Doubtless ill-managed farms must be the result of encouraging people to take up land without sufficient capital to work it, persons, too, ignorant of agriculture."

We turn with pleasure to the work of the Eight Years' Resident in Queensland, but wish he had given his book a more rational title. Doubtless, this title was suggested by the name of the colony, and he amuses himself with playing on the word "Queen," but he ought to have remembered that Queensland has before now suffered from being unduly cried up, and that to exalt it above all our other colonies is consistent neither with truth nor good taste.

The author, who also writes anonymously, tells us in his introduction that his book was written at the end of 1871, and that various causes, among others his diffidence as to the value of his work, have delayed its publication. This is, we think, to be regretted; four years make a long period in the life of an Australian colony, and many great changes have taken place in that time—these are, indeed, mentioned in notes, and a concluding chapter brings the state of the colony up to last year, yet we fear the reader who seeks for present information may be tempted to lay the book aside as too old.

Queensland, the youngest of the five Australian colonies, stands third in extent and fourth in population, fourth also in the amount of its exports and imports. The Tropic divides the colony into nearly equal halves, but the southern portion includes nearly all the agricultural and mining population as well as every town of importance. The part within the tropics which, from the configuration of the country, possesses a very much greater extent of sea-coast, consists, so far as it is settled at all, of squatting districts, and was not visited by the author.

We propose to touch on some of the most important points connected with the southern portion of the colony as treated

by the writer, who is evidently a shrewd observer, shows a thorough knowledge of his subject, and writes with vigour and authority.

He describes the climate as singularly temperate for a country lying so close to the tropics; this is owing to the sea-breeze that invariably blows inland every day in the summer season.

"It usually begins to be felt about 9 A.M., before which time it will be hot. But as soon as the toiler feels the cooling breeze playing about his forehead he is sensible of a wonderful change. Although the sun rises higher and higher, until he shines down the chimneys into the pots on the fire, the cool breeze tempers his rays and makes him bearable. Were it not for this breeze, we believe it would be almost impossible for the European to do much manual work in the Queensland summer. As it is, he can work with as much comfort and more safety than in the more southern colonies, or even in the fields of Upper Canada, or on the prairies of the Western States. We are aware that many will be inclined to doubt this statement. But we have found the summers of Queensland more endurable than those of Upper Canada, frost-bound region as many suppose that to be. As to safety, it is only necessary to compare the number of deaths from sunstroke in those places to prove the truth of our assertion" (pp. 184, 5).

During the eight years the writer spent in Queensland the hot wind known by the southern colonists as the "brick-fielder" blew but once. The rains continue, as a rule, from February to April; then begins the Queensland winter, than which it is scarcely possible to conceive a more lovely season: slight frosts occasionally occur, sufficient to injure the sugar-canes and bananas in exposed situations. The great scourges of Australia are drought and flood; our author inclines to believe that the settlement of the country may in great measure modify these evils: old inhabitants observe that the weather is now more showery than formerly. A vivid description of floods will be found at pages 170-1.

Queensland is favourable to the produce both of temperate and tropical climates. Barley, oats, maize, lucerne, tobacco, arrow-root, potatoes, yams, bananas, sorghum, vines, pine-apples, ginger, several fibre-producing plants, and all sorts of vegetables and fruits are successfully grown; the wheat is of the very finest quality, and we cannot doubt that sugar and cotton will become the great staple of the colony; coffee, tea, madder, and silk will also probably succeed. An absurd notion has been started that the less a man knew about farming the better he would succeed in the colony, but common sense teaches us the reverse—that a practical farmer will always have an advantage over others, both from his experience and his habits of life. Capital too is necessary here as elsewhere, and we gather both from this book and the *Sketches of Australian Life and Scenery* that small farmers with some capital are the class most likely to make fortunes in the colonies of Victoria and Queensland. In no colony can good land be bought so cheap as in Queensland; a farm one mile square can be purchased in fee simple at the almost nominal price of 6*d.* per acre for five years. The climate is so favourable to our bees (there are inferior native sorts) that instances have been known

in which a hive has increased thirty-fold in one year—swarms are thrown off all the year round; they are advancing westward, and

"in a few years will have penetrated into the great unknown interior. When that time arrives the explorer may push out with confidence as to a supply of food, for no one need be hungry when the bee can be seen humming among the grass and flowers" (p. 274).

The author's experience of the Chinese immigrants is very favourable to their industry, honesty, morality, hospitality, and domestic virtues. The Chinaman never holds himself at a cheaper rate than a white man, and accepts with great reluctance a lower rate of wages. This would seem to be an important element in the labour question. The chapter on the aborigines is particularly interesting: the writer passed two or three years in a part of the country into which few whites had at that time penetrated, and had thus an opportunity of studying them in their primitive simplicity; he corrects some misrepresentations concerning them, and altogether forms a higher opinion of both their physical and mental powers than the one generally received. They have a curious superstition, which dates from a time anterior to the first visits of Europeans, that after death they rise up white.

A highly important industry is the dugong (*Halicore Australis*) fishery; these strange mammals frequent in immense herds the shallows of the Queensland coast, in which grows the sea-grass on which they feed. The oil of this animal is equal to cod-liver oil, with the advantage of being pleasant to the taste. The bones are valuable as ivory.

We have no inclination to enter into the politics of the colony, or the land question which has caused such heart-burnings and dissensions, though we must think there is something to be said on the side of the squatters, and we cannot but feel some sympathy for a man who, having occupied and probably improved land for years, sees strangers come and select and, as he thinks, deprive him of portions, and those probably the best. In any case, it is not to be wondered at that the squatters should use the influence they possess to keep the land in their own hands; the real fault probably rests with the system of granting vast tracts for a time limited, without a sufficiently well defined and considered right of pre-emption.

Our author modestly disclaims for his work the merit of being exhaustive, but there is hardly anything relating to the colony that may not be found in his book, which we heartily recommend to all those who either contemplate emigration, or desire to obtain information respecting Queensland.

We have only space left for a brief notice of Mr. HARCUS's *South Australia, its History, Resources, and Productions*, published by authority of the Government of that colony as a handbook for the commissioners appointed to collect specimens for the Philadelphia Centenary Exhibition. Mr. HARCUS is editor of the whole and author of a considerable portion, and has produced a work as comprehensive as that of the *Eight Years' Resident in Queensland*, and brought down to the latest possible date. He gives

us a complete history and general account of the colony both past and present, and evidently writes from his heart; but, while we admire the progress and prosperity of his favourite country, we must be permitted to doubt whether it is in every respect as perfect as he represents it to be.

The prosperity of South Australia (the largest of the five Australian colonies) is likely to be hampered by its enormous and unwieldy extent; indeed, South Australia has now become a misnomer, inasmuch as the colony contains a larger portion of the north of Australia than either Queensland or Western Australia. Should this northern part ever be peopled, a separation of the colony into two divisions is inevitable. It now stretches from lat. 11° S. to lat. 38° S., about the same distance as Gibraltar is from the Farøe Islands, and that without any water communication. The capital, moreover, is at the extreme south.

This colony may justly be proud of its overland telegraph, traversing the centre of Australia from Adelaide to Port Darwin, a distance of nearly 2,000 miles. It might naturally be supposed that the natives would have injured the telegraphs and appropriated the iron posts and wires to their own use. This danger has been ingeniously removed:—

"They seem to have a wholesome dread of the telegraph. During the process of building, the operators gave several of the curious blackfellows electric shocks, which alarmed them beyond measure, and vividly appealed to their imagination. They learned to associate the peculiar sensation caused by the shock with the line, and this has prevented them interfering with it. The terror caused by reports of 'whitefellows devil' spread like wildfire amongst the timorous savages. They have attacked the operators at the stations, and sometimes with fatal consequences, but they fight shy of the wires" (p. 107).

Wheat is one of the great staples of South Australia, and the quality is described as excellent, but the tables furnished show, what we have before noticed in the produce of other recently-settled countries, that the quantity per acre is very much less than is produced in England. In no case has the average for the year amounted to fifteen bushels per acre, and in two years it was below five. In this country thirty-five bushels per acre is no extraordinary yield.

Chapters on special subjects from the pens of other writers are added to Mr. HARCUS's more general account of the colony, and among these we would call attention to the able treatise on the flora of South Australia, by Dr. SCHOMBURGK, the director of the Botanic Gardens at Adelaide, who extends his observations to those vegetable productions which, though not yet forming articles of export, or of much colonial consumption, might be raised with advantage in the colony. His account of the troublesome foreign weeds now naturalised is remarkable.

The book, which is well got up, is profusely illustrated and furnished with useful maps.

WILLIAM WICKHAM.

DR. A. WILSON, not Dr. A. Wright, is the author of the pamphlet *On the Study of Zoology*, mentioned in our Science Notes of last week.

NEW NOVELS.

Jennie of "The Prince's." In Three Volumes. (London: R. Bentley & Son, 1876.)

Playing for Love. In Three Volumes. By E. C. Clayton. (London: Tinsley Brothers, 1876.)

Captain Fanny. In Three Volumes. By the author of "John Holdsworth, Chief Mate." (London: R. Bentley & Son, 1876.)

The Three Brides. In Two Volumes. By Charlotte M. Yonge. (London: Macmillan & Co., 1876.)

Jennie of "The Prince's" is written professedly with the object of showing that a right-minded woman can, in the words of the author, "hold her own bravely even on the much-abused stage." We should be very sorry, and very much surprised, if any one asserted she could not; but we fear that the book before us would be very far from convincing such a sceptic of his error. It would, indeed, be pleasant to believe that the life of every actress ran in such smooth grooves. No sooner has Jennie made up her mind to take to the stage (of course, on the strength of some amateur theatricals, where she has been pronounced "a born actress") than she meets with Mr. Favor, the star of the "Royal Magenta Theatre." This gentleman, whose cultivated daughters afterwards become her great friends, introduces her to Mr. and Mrs. Hazel Browne of the same theatre, and of equally irreproachable character. With these she boards and lodges; and they, in their turn, introduce her to the manager of the theatre, and then to the proprietor, Mr. Bothwell, who is discovered to be a distant cousin of Jennie's. By the aid of these kind friends she studies under another delightful lady, Miss Gordon, and eventually a small engagement is procured for her at a town called "Forrester," the description of which bears a strong resemblance to Exeter. Here a sister of Mrs. Hazel Browne—an author—is kindly waiting to receive her into her house; and, after a short interval, Jennie is of course afforded an opportunity of distinguishing herself. The leading lady is to take her benefit, and chooses the *Colleen Bawn* in which to shine; but with truly remarkable taste reserves the part of Ann Chute for herself, leaving Eily O'Connor to a subordinate. The subordinate sprains her ankle, and Jennie plays the part to perfection with only twenty-four hours' preparation. Another London manager and his wife—Mr. and Mrs. Jonas Belfoy—if possible still more highly gifted than our previous acquaintances, present themselves that very evening, and the result is that Jennie is offered the position of leading lady at the "Prince's"—a theatre which is described to us as the most fashionable in London. For an account of the wonderful play entitled *Lady Undine*, written by Mrs. Jonas Belfoy herself, which achieved such a conspicuous success, we must refer our readers to the book; we do not think it likely that a dramatic author of the present day will be tempted to pirate any portion of it. In this way, at the age of eighteen, within a year of her first decisive step in the

direction of the boards, did the fortunate Jennie win for herself a place in the foremost rank of her profession—and all this without a mishap, with hardly one of the disagreeables incident to the life she had chosen: certainly having incurred less rudeness than she had submitted to in the previous year from the hero of the story, whom she afterwards married. But, as the following is the author's description of that gentleman's *modus operandi*, this is scarcely to be wondered at:—

"Frank addressed the ladies he liked in a certain bantering tone peculiar to himself, lectured them mercilessly on little weaknesses that other men would have passed over in silence, and gravely called the ladies to order on subjects of taste, dress, and manners."

In spite of an unhappy straining after smart writing in the first volume, and an immense deal of carelessness and sheer nonsense all over the book, *Jennie* is readable enough, and the author's next attempt will probably be better. She would do well, however, to abstain from using Latin phrases in future, as "in multo terrorem" is a blunder that should not be repeated.

Playing for Love is a very colourless book. The characters of the men in particular are thoroughly wanting in life, and through two volumes of small print no action whatever takes place. In the third volume, to be sure, we have a will stolen, and an attempt at murder and suicide, but the experienced reader well knows that all these efforts to disturb the course of true love will in the end be frustrated. There are three couples respectively ready to start in life if only sufficient funds are forthcoming, and accordingly an old gentleman, who has up to this point been absolutely notorious for his excellent health, in a few weeks fades away by a species of atrophy, and very conveniently cuts up into three six-thousands a year, which are bequeathed to the right people. The book is perfectly harmless, and may be interesting to those who like long descriptions of dress, and what are supposed to be pictures of society.

It is difficult to conceive an author who is clearly capable of better things writing such a book—or, when written, giving his book such an odious name—as *Captain Fanny*. The heroine is a certain Miss Fanny Rogers, who has an admirer in the person of a rich but elderly Colonel, the owner of a beautiful yacht. Conveying his admiration by no very roundabout method, he declares that she shall be his and his yacht's captain, and ultimately Miss Rogers takes the same view and marries him. She is described as a young lady who "honestly says what comes into her head; some vulgar words are expressive, and she outs with them, and cares so little about opinion that she never troubles to think that her talk may be very ungraceful, not to say even low, at times." As is the heroine, so is the book: we are entertained with a long description of a regatta, and of the heroine's delight at witnessing what is called "the greasy-pole business;" further on, of a pic-nic, where a young man sits down in the salad bowl; and other incidents occur of a like character. Colonel Swayne is a gentleman, and it is incredible that he should have tolerated for a

moment Miss Rogers or her belongings, still less that he should have accepted her at her own invitation, on the very day that the man for whose sake she had previously refused him had jilted her.

It is characteristic of Miss Yonge that she loves to deal in numbers. Novelists in general find moderate families more manageable; but Miss Yonge insists on the mental effort which is required to grasp the names and individualities of a perfect phalanx of brothers and sisters. The reader might approach one of her books with the hope that there might be a reduction on taking a quantity; but we can assure him that in the present case the two portly volumes of rather small print are fully equal to the conventional three. It is true that here the family consists of a mother with only five children; but the five children are all sons, and three of them have wives when the story opens. A feeling of bewilderment and despair creeps over one when on page 2 we read: "Raymond and his Cecil will be at Holford's Gate at 5.30," "Julius and Rosamond by the down train at Willansborough at 4.50," and that Mrs. Johnson is to drop "that poor wife of Miles's by the express at Backsworth at 3.30." We cannot attempt a description of the differences that take place between the squire's wife and the rector's, nor of the curious discussion on Woman's Rights which is introduced. There is no want of incident, of excellent morality, or of long conversations. The whole does not seem to us very interesting; but we suppose that those who have liked Miss Yonge's novels before will like the *Three Brides*, and we are sure we hope they will.

F. M. ALLEYNE.

CURRENT THEOLOGY.

The Humiliation of Christ, in its Physical, Ethical, and Official Aspects. (Cunningham Lectures for 1875.) By Alex. B. Bruce, D.D., Professor of Divinity, Free Church College, Glasgow. (T. and T. Clark.)

Christianity as Taught by St. Paul. (Bampton Lectures, 1870.) By William J. Irons, D.D., Rector of St. Mary Woolnoth, and Prebendary of St. Paul's. Second Edition. (James Parker and Co.)

The Doctrine of Retribution. (Bampton Lectures for 1875.) By William Jackson, M.A., F.S.A., formerly Fellow of Worcester College. (Hodder and Stoughton.)

Priesthood in the Light of the New Testament. (The Congregational Union Lecture for 1876.) By E. Mellor, D.D. (Hodder and Stoughton.)

THE Free Church of Scotland has not in general the reputation of a very learned body, but its representative among these specimens of theological teaching is unquestionably entitled to precedence over all the rest. There are many men in the English Church who are not supposed to be in any wise ignorant of theology to whom Dr. Bruce's volume will be the opening of a new region of thought, as well as an illumination and vivification of what knowledge they had. It is true that recent controversy in England has broken up the state of mind, produced by the unacknowledged influence of Gibbon, to which the Nestorian and Eutychian controversies seemed mere logomachies; the discussion as to the value and the origin of the Athanasian Creed has even familiarised men with the fact that the formula of Chalcedon was by no means the last word spoken on the subject. But the isolation in which the English Church

or Churches have lived since the seventeenth century has made English theologians, and not those of the National Church exclusively, apt to lose sight of the progress of religious thought in other countries, except so far as it could be appealed to in direct illustration of the controversies they themselves were concerned in. The age from the Council of Chalcedon to that of Frankfort is well called by Dr. Bruce "the dreary period of Christology," and anyone who has mastered the history of the earlier period may be allowed to content himself with a cursory survey of the latter. But few have thought of, though some may have vaguely felt, the difference of mediæval language from Scriptural and even Patristic on the one hand, and from that of modern Christianity on the other: and while no one can help knowing that theological thought has been active in Germany from the sixteenth century to the nineteenth, few Englishmen probably conceive its activity to have been engaged on the same questions as that of the primitive Church. The controversies which Englishmen have heard of and shared in, on the nature of grace, of justification, of the sacraments, and more recently on the reality of the supernatural in Christian history and literature, seem to average students to contrast with those about the natures and person of Christ as practical questions with speculative: it will be a surprise to such to learn that the one class of questions was found to involve the other. We sometimes hear Hooker praised for the profundity of his conception that "it seemeth requisite that we first consider how God is in Christ, then how Christ is in us," before enquiring "how the sacraments do serve to make us partakers of Christ." No doubt the conception is truly profound as compared with the empirical or verbal controversies of our day on sacramental grace: but the praise of it is by no means exclusively to be ascribed to Hooker personally. Dorner's *History of the Doctrine of the Person of Christ* has done something, and ought to have done more, to teach men that that doctrine has a history which, instead of ending 1,400 years ago, is not ended yet: but Dorner is a dull and difficult writer—not a man to put life into the questions he discusses technically, scarcely even a man to make his readers realise that the questions are vital. Now, Dr. Bruce's book is not one to supersede Dorner's, but in these respects it may do what Dorner's fails to do. He opens with some technicality of statement, which suggests that his hearers or readers, as well as himself, are expected to have some familiarity with a literature in which the tradition of scholastic method has never been broken: but in the main substance of the work, he constantly, and on principle, treats the questions under discussion in the light of their relation to practical Christianity. And thus he brings out the virtual doctrines—not always formulated in express terms, and never confessed to be inconsistent with the received Catholic dogmas—characteristic of different ages and schools of thought. Tracing the Catholic tradition in East and West down to Damascene and Aquinas, he points out the Monophysite, not to say Sabellian, tendency of Mediæval theology; which he might have illustrated, but does not, by the popular English oaths "sdeath," &c., and their analogues in other languages. This is followed by a comparison of "the Lutheran and Reformed Christologies"—with an avowed preference, as was natural, given to the latter, and a just observation of the pantheistic tendency of the former. It is a slight deduction from the credit due to this part of the work, that it is not noticed that the Reformed doctrine has historically shown a tendency, at least equally pronounced, to Socinianism: Dr. Bruce, without mentioning the fact, shows its causes sufficiently plainly. Perhaps disproportionate space is given to what are called "Modern Kenotic Theories"—the semi-Apollinarian speculations of so-called orthodox German and Danish theologians of our time. And there is not much

of original value, though there is not a little of suggestiveness and devout insight, in what is said on the doctrine of the Atonement. Here, more than anywhere through the volume, the reader feels that Dr. Bruce's theological reading, large as it is, is still one-sided—that he is too little familiar with Roman Catholic and even with Anglican writers on the subject. He acknowledges the difference between the doctrines of St. Anselm and of the Reformers, and, while repudiating the painful language of the latter, gives in his adhesion to the substance of their opinions. But he seems not to see the inadequacy of the term "redemption by sample" which he applies to the doctrine of the pre-Anselmian fathers, and (if general terms may be used) of modern Catholic and Catholicising theologians: when he rejects this as coming short of the teaching of Scripture, they may fairly contend that their own teaching as well as that of Scripture is misconceived. But they are able to speak for themselves, to at least as many in England as are likely to hear Dr. Bruce's censure.

Dr. Irons's volume of Bampton Lectures has reached a second edition, owing to its possessing all the merits which an exegetical work can have when executed by a man totally destitute of the exegetical faculty. In nearly every difficult passage in St. Paul's Epistles where it can be affirmed that one explanation is right, Dr. Irons adopts a wrong one—often not the wrong one which is obvious or popular, but one excogitated with more ingenuity than might have guided another man right. What is to be said of the critical capacity of a believer in the Apostle's release from Rome and second imprisonment, who dates the First Epistle to Timothy between the two to the Corinthians, that to Titus shortly after the Romans and the Milesian address, and makes the Second to Timothy to be followed in order by the Ephesians, Colossians and Philemon, Philippians and Hebrews? In this case Dr. Irons not only mistranslates, but entirely evacuates of meaning the sublime passage which, more than any other evidence, seems to establish the genuineness of the Pastoral Epistles to those who in such matters give weight to their affections; the Apostle is made to declare that "the time of my release from prison is at hand," when it was not, and to be as jubilant in the prospect as if it were indeed his final triumph. But this sort of mistake is exceptional in the book. Speaking generally, Dr. Irons has a real insight into the spirit of his author, greater than can be secured by the merely critical faculty. There are few, if any, writers of our day who could have ventured, without far more entire failure, to express the Apostle's thoughts in modern language, as is done in the "Continuous Sense" appended to the Lectures; it is really clearer than a translation would be, and only further from being exegetically right because it is forced to be wrong when a translation could afford to be ambiguous. Both from it and from the Lectures, a well-informed reader will derive many valuable suggestions as to St. Paul's real attitude on the main questions he dealt with; and a reader even not well-informed may find the elevation that comes from intercourse with a spirit trained under St. Paul's influence. Dr. Irons is too anxious to show that St. Paul was not a Protestant to do full justice to the side of his teaching out of which Protestantism has developed; but it is sufficiently true that that is only one side of his teaching to allow a commentator who minimises it to be far from valueless in his view of the whole.

Either Mr. Jackson's method is obscure in explaining his subject, or his title misleading in expressing it. Two or three passages may, with difficulty, be found in the volume, where "the Doctrine of Retribution," understood in its plain sense—something approaching the spirit of

ἐκ κατὰ τοὺς ἄλλους ἐρεξε, δικη καὶ ἰδὲα γένετο—

is not enunciated or defended, but assumed. But

the real subject of the book is the Reality of Moral Distinctions, as taught by Kant and denied by Hume—a perfectly legitimate subject, no doubt, for a course of University Lectures, and perhaps not as entirely beyond the range of ideas of an undergraduate audience as it would have been eight or ten years ago. But if it is possible and desirable that the ethical doctrines of Kant shall be taught as an intellectual basis for Christian virtue, there is a right and a wrong way of teaching them. Kant is no doubt a difficult writer, but his difficulties are not solved by encouraging the student to drift past them on a flood of emotion. Mr. Jackson tries to be an emotional preacher, and gives the impression that his emotion is itself somewhat strained, as well as the utterance of it out of place. No one who did not know Kant well would learn much of him from these lectures: anyone who did know him, and admired him, would feel little sympathy for his eulogist.

Dr. Mellor is scarcely successful in maintaining the position which the Congregational Union Lecture promised to hold in the theological literature of the day. He really need not have troubled himself to prove that the word *ιερεὺς* and its cognates are seldom used in the New Testament of Christians, still more seldom of Christian ministers as distinct from the body of the Church, and never of Christian ministers in regard of what are now considered their especially sacerdotal functions. If it was worth while pursuing this argument at all, it would have been necessary to meet those that have been, or may be, advanced on the other side—e.g., that *λειτουργεῖν* seems to have as distinctly sacerdotal associations as *ιεροῦργεῖν*; or, that functions which confessedly are ascribed to the whole Church may by a legitimate use of language be ascribed to the "differentiated" members, by which, as an organised body, the Church discharges them. But a more serious fault than this omission is the total want of moral sympathy with his opponents, which degrades his tone to that of a religious newspaper. Sacerdotalism may or may not have roots in the Christian Revelation: but if not, it is all the more certain that it has roots in human nature, and that those roots strike in some less corrupt soil than the corporate vanity of the clergy, or the moral indolence and cowardice of individuals among the laity.

L'Exode et les monuments Égyptiens. Discours prononcé à l'occasion du congrès international à Londres. Par Henri Brugsch-Bey. (Leipzig: Hinrichs.) A brilliant and all but successful attempt, after Schleiden, to revolutionise the interpretation of the route of the Israelites at the Exodus. Our readers are already familiar with its main features from the very full report published in these columns on September 26, 1874. The hypothesis that the "yam süph" of the original tradition meant the Sirbonian lake, and that the scene of the Pharaoh's catastrophe was the narrow strip of land which separated the "yam süph" from the Mediterranean has not met with general acceptance either among Egyptologists or among Biblical scholars. Apart from the philological difficulties to which Dr. Birch has alluded, it is not easy to see how the women and children of the Israelites could have been collected in a single night at a place so far to the north of Phakussa (Brugsch-Bey's Goshen) as Tanis (our author's Rameses), or how the proposed line of march can be reconciled with Ex. xiii. 17, which says that "God led them (the Israelites) not on the way to the land of the Philistines." But to these and other objections we may expect some answer in the work of which a prospectus has been circulated called "Bibel und Denkmäler," by the same eminent explorer of the hieroglyphic records. Is it too much to hope that the self-assertion which pervades the London address, and the almost fulsome language towards the Scriptures, may be mitigated in Brugsch-Bey's next publications? The map of ancient Egypt which accompanies the address will be found

highly useful by historical students; it sums up the author's main geographical results.

A Retrospect of the Religious Life of England. By John James Tayler, B.A. Second Edition, re-issued with an Introductory Chapter on Recent Developments, by James Martineau, LL.D., D.D. (Trübner.) The late Mr. Tayler was one of the most accomplished theologians of his day, one whom an Ewald or a Dorner would not hesitate to call "scientific," but amply endowed with English sense and reverence for the historic past. Of the latter quality his *Retrospect of the Religious Life of England* is a beautiful monument. It may be doubted whether there is any single book which covers such a wide extent of ground and offends so few prejudices. It is, indeed, not only a History of Theology, but a *Culturgeschichte*, as Dr. Martineau most truly remarks, in so far as it surveys the national culture in its religious aspect. There are few subjects of general interest which may not be illustrated historically from these well-filled pages—among others, academic reform. Cromwell's interest in learning, and his own and the Puritans' services to Oxford, deserve to be more widely known. The liberal theological spirit of the old Dissenting academies contrasts favourably with the depressing system which is not yet extinct in the universities. The academy at Warrington numbered among its professors one of the most learned Hebraists of the day, Dr. John Taylor, to whom is due a *Paraphrase on Romans* which has, we happen to know, extorted the admiration of the most cautious and learned of living German theologians. The Introductory Chapter by Dr. Martineau contains some weighty criticisms on recent religious developments; that on *Ecce Homo* is specially remarkable for its penetration.

Studies Biblical and Oriental. By the Rev. William Turner. (Edinburgh: A. and C. Black.) A volume of essays, some of which have already appeared in the *Journal of Sacred Literature*. The first contains a description of the method of cuneiform decipherment, with plain directions how to verify its results. This is extremely opportune, as sceptics like Dr. Kay continue to throw doubt on the trustworthiness of the decipherers, generally without having taken ordinary pains to learn their method. There is also an elaborate examination of Brugsch's theory of the Exodus, and a very careful summary of the Assyrian notices of invasions of the Land of Israel. But the most valuable article is probably that on the Hebrew Tenses, in which the writer, after examining other views, propounds a distinction between the first or factual and the second or descriptive verbal form. A slip on p. 289, note 1, may be corrected in a second edition.

Messianic Prophecy: its Origin, Historical Character, and Relation to New Testament Fulfilment. By Dr. Edward Riehm, Professor of Theology, Halle. Translated by the Rev. John Jefferson. (Edinburgh: T. and T. Clark.) It is a pleasure to meet an old friend (we refer to the original articles here re-issued) in a new dress. In an extract from a letter to the translator, Dr. Riehm states that "many believing theologians in Germany, who were suspicious of criticism and severe historical exegesis, have testified [after reading this book] that they are reconcilable both with faith in divine revelation . . . and the acknowledgment that all divine prophecy is Yea and Amen in Christ Jesus." A statement like this necessarily disarms criticism. All that need be added is that the method of exegesis is, not dogmatic, but grammatical and historical. The first two sections explain the origin and historical character of Messianic prophecy; the third, its relation to the New Testament.

Biblical Commentary on the Prophecies of Ezekiel. By C. F. Keil, D.D. Translated by the Rev. J. Martin, B.A. (Edinburgh: T. and T. Clark.) The merits and defects of Dr. Keil as a commentator are too well known for us to

do more than call attention to this useful and laborious work.

A Concordance of the Hebrew and Chaldee Scriptures. Revised and corrected. By B. Davidson. (Bagster.) The size and costliness of Fürst's *Hebrew Concordance* has prevented many Hebraists from acquiring this indispensable aid to their studies. Messrs. Bagster deserve warm thanks for their enterprise in publishing this convenient and beautifully printed volume, the publishing price of which is, we believe, three guineas. Each word has its meanings given in brief, and is furnished with a condensed but complete analysis, so that the learner of Hebrew may from the first familiarise himself with this great storehouse of linguistic facts. Every exertion appears to have been made to ensure accuracy.

The Antiquities of Israel. By Heinrich Ewald. Translated from the German by H. S. Solly, M.A. (Longmans.) Purchasers of Ewald's *History of Israel* will welcome this translation of the supplementary volume. Nowhere, perhaps, is the author's architectonic ability more conspicuously displayed than in this bold attempt to systematise "the heterogeneous and bewildering mass" of the Jewish laws, both civil and religious (but Ewald rightly ignores the distinction). No criticism of details would be of any use to the reader. Ewald is always interesting and suggestive; but the views formulated in this volume were arrived at many years ago in a now-antiquated stage of Pentateuch-criticism, and must not be regarded as final. The great point in this, as in other subjects, is to get a definite principle of arrangement; this Ewald gives us, and, whether right or wrong, we may be thankful for it. Unarranged matter is worse than useless. The translation is simply excellent; no correction of any moment occurs to us. One only regrets that such good abilities were not more productively employed. A tithe of the trouble involved in turning Ewald into English would have taught most people German. Perhaps in future editions of the *History* and the *Antiquities* we may hope to get the misleading Jahveh corrected into Yahveh. The horror of the sound of Jehovah was nothing to this new abomination.

The Psalms, with Introductions and Critical Notes. By the Rev. A. C. Jennings, M.A., and the Rev. W. H. Lowe, M.A. Book V. Psalms cvii. to cl. (Macmillan.) We have nothing to add to our former notice of this useful introductory work, except a more decided eulogy of the Rabbinical acquirements of the editors. The untrustworthiness of the quotations from Jewish works in Raymond Martini's *Pugio Fidei*, and even Schoettgen's *Horae Hebraicae*, is shown by several examples. Among the best notes we may mention that upon Psalm cxix. 54, where it is shown that "everlasting house" merely means "the grave (cf. *domus aeterna*, in *Inscr. Orell.* 1174, &c.), not, as has been supposed, the state of continued existence after death." This has an important bearing on the doctrine of the pessimistic, though (in spite of himself) theistic, writer of Ecclesiastes (see Eccl. xii. 5, and comp. iii. 21).

Mivah; a New Translation with Notes for English Readers and Hebrew Students. By John Sharpe, M.A., Rector of Gissing, Norfolk. (Cambridge: J. Hall & Son; London: Whittaker & Co.) It is difficult to criticise a work which, professing to explain Hebrew from itself alone, contradicts the fundamental principles of Semitic philology. We fear it can only mislead students, and retard the revival of Hebrew scholarship.

NOTES AND NEWS.

We hear that Mr. William Morris has an Epic poem in the press, the subject of which is the great Northern story of Sigurd and the Niblungs. The author has for the most part followed closely the Eddaic version of the tale.

MR. W. E. H. LECKY is engaged in writing a history of Social Life in the eighteenth century.

PROF. J. P. MAHAFFY has written a detailed and very interesting book on his recent travels in Greece, which will be out this autumn.

THE second volume of the late Lord Dunraven's *Notes on Irish Architecture* (see ACADEMY, vol. ix., p. 491) is in a state of forwardness under the unwearied hands of Miss Stokes, and will be ready, it is hoped, in a few months. It will deal principally with the Round Towers and Ornamented Romanesque Churches anterior to the Anglo-Norman Settlement: on the former problem the manuscript letters of O'Donovan and O'Curry written when engaged in the Ordnance Survey, as well as the posthumous papers of Dr. Petrie, have been laid under contribution. Miss Stokes will add a *résumé* of the whole work.

THE late Sir William Wilde's excellent Guide to the Boyne and Blackwater, now out of print, will shortly be re-edited by his son.

MR. FURNIVALL in his recently issued Report to the Chaucer Society asks again for the payment in advance of subscriptions for 1877 and 1878, in order to cover the expenses of some ten new instalments of work besides the completion of the *Canterbury Tales* and *Minor Poems*. We heartily wish him success.

The Yorkshire Lias, by Messrs. Ralph Tate and J. F. Blake, a work which has occupied the attention of its authors for some years, is just ready for publication by Mr. Van Voorst. It forms a volume of 475 pages, half of which is devoted to Geology, and half to Palaeontology, illustrated by maps and plates. Nearly three hundred species of Fossils are figured.

THE donations to the Cambridge University Library during the past year have been numerous and valuable. The annual Report of the Syndicate, just issued, makes special reference to the Sanskrit and Tibetan MSS. presented by Professor Wright and his brother, Mr. D. Wright, among them being an important collection relating to Northern Buddhism, some portions of it as old as the ninth century, obtained in Nepaul, and a Samaritan Pentateuch of the tenth century. The first volume of Dr. Schiller-Szinessy's Catalogue of the Hebrew MSS. has been published.

THE French papers announce that an important collection of documents has just been bequeathed to the National Library, consisting of the voluminous correspondence of Napoleon III. with his foster-sister, Mdme. Cornu. The letters begin when Prince Louis was only ten years of age, and the last was written by the ex-Emperor two months before his death. By the will of Mdme. Cornu it is provided that the letters shall not be published until the year 1885, and they were accordingly at once sealed up on their delivery at the National Library. The testatrix has named M. Renan, or in default M. Duruy, to superintend their publication.

BESIDE the new manuscripts in the British Museum noted in our issue of last week, the following, we are informed, chiefly of interest to the student of Church history, have also been added to the list:—"Hymnarium in usum Fratrum heremitarum ord. S. Augustini, apud Locum S. Salvatoris de Silva lacus," (Sienae) 1415, vellum, with miniatures; "The Mirror of the Life of Christ; translated from the Latin of Bonaventura by Nicholas Love, Prior of Mountgrace, co. York," vellum, fifteenth century; "Cronica Monasterii Sancti Bertini [in St. Omer] to the Election of Eustace Gommer, 14th Abbot, in 1294," fifteenth century (this manuscript is noteworthy from its containing not only matters strictly ecclesiastical, but also much information respecting secular affairs from the reign of Clotaire II. to the thirteenth century, including the Crusades and early English history); the Four Gospels in Dutch, written in the year 1426.

formerly belonging to the Nunnery of St. Catherine of Hoern; a Life of Christ, in Russian, eighteenth century; the Four Books of Pope Gregory the Great's Dialogues, in Spanish, fifteenth century. (This manuscript formerly belonged to D. Jayme La Cueba, and subsequently to Fray Henrique Florez, author of *España Sagrada*, and has both their autographs. Inside the covers is written, "A Francorum rapacitate liberatus codex eximius Anno 1814." Beneath this, "Iterum ereptus propter Wandalismi timorem 8 die Augusti 1835.")

A "Chronique de la Pucelle Dorleans Jehanne Darc. Escript en la Ville Dorleans en nostre Convent lan 1612," was also, like some of the fore-named manuscripts, bought by the Museum authorities at Mr. Bragge's sale in June. This is written on very thick parchment, within scrolled borders composed of architectural ornaments, leaves, flowers, insects, quadrupeds, human figures, &c., executed in very bright colours, heightened with gold; and has on the first leaf an equestrian portrait of Joan of Arc, who is painted in armour riding from the gates of the city on a white horse, sword in right hand and flag in left. Beneath the portrait is written "De par Dieu pour la France et Mon Roy." The binding of the manuscript, especially the fastening of the leaves together, is a very uncommon specimen of the ingenuity of the nuns of that time.

AMONG other curiosities lately acquired for the same collection is a parchment roll, measuring sixteen feet and a half in length, and about seven inches in breadth, on which is written an "Inventory of all the Goods and Chattells of Robert Morton Gentylman preysyd by William Maryner and Simon Ogan Artezens of London and preysers to the most reverend flader in God the Archbysshop of Canterbury the first day of August in the yere of our Lord God 1488." From this inventory we learn that Morton's possessions included two chapels, 150*l.* in "Redy money," much plate, and a quantity of furniture; his library consisted of a "Masseboke, 2 Sawters, a Prymer, a lytell Masseboke, a lytell Grayle, an old porteforium." Among the bequests named are four standing silver-gilt cups to the Archbishop of Canterbury, my Lord of Worcester, John Forster, and Henry Assheborne. Morton's property lay chiefly in London, and in Standon, Hertfordshire.

THE eighth series of the New Shakspeare Society's publications, that of *Miscellanies*, will be opened by a reprint of Prof. W. Spalding's "Letter on the Authorship of *The Two Noble Kinsmen*," which convinced Hallam and Dyce, among others, that Shakspeare wrote a large part of that play. This reprint will accompany Mr. Harold Littleddale's edition of the play for the New Shakspeare Society, but has not been resolved on with reference to that play alone. The "Letter" contains one of the best, if not the best, extant discussions of the characteristics of Shakspeare's latest style and the secret of his supremacy. The reprint is undertaken with the gratified consent of Prof. Spalding's widow and family; and his old schoolfellow and friend, Dr. John Hill Burton, the well-known antiquarian and historian of Scotland, has written an interesting memoir of the author, to be prefixed to the new edition. The book will probably also contain an Introduction and Notes by Mr. Harold Littleddale and Mr. Furnivall.

THE New Shakspeare Society has done an act for which Shakspeare-students and the public generally will thank it. Having had the old Elizabethan survey or John Norden's map of Shakspeare's London in 1593, which was engraved by Peter van der Keere, enlarged to four times its original size, and cut on wood by Mr. Hooper, the Society has resolved to make the map, so full of interest to all Shakspeare-students and lovers in London, accessible to all who care to have it, at a small price, and not to confine it to the Society's own members. The proprietors of the *Graphic* have co-operated,

and will shortly issue the map in one of the numbers of their widely-circulated paper. The map of the Strand and Westminster will follow in due course.

THE forthcoming Part of the *Transactions* of the Philological Society will contain the Fifth Annual Address of the President to the Philological Society, delivered at the anniversary meeting, Friday, May 19, 1876, by the Rev. Richard Morris, M.A., LL.D., including Reports by the President, on the "Work of the Philological Society in 1875-6;" the President, on "English Dialects;" Dr. J. Muir, on "Sanskrit;" Prof. Eggeling, on "Sanskrit;" M. le Chev. E. de Ujfalvy, "Des Langues ougro-finnoises;" Dr. Ad. Neubauer, on "Talmudical and Rabbinical Literature;" the Rev. A. H. Sayce, on "Etruscan;" Mr. R. N. Cust, on the "Non-Aryan Languages of India;" Dr. J. Hammond Trumbull, on the "North-American Indian Languages;" M. Edouard Naville, "Revue des derniers travaux égyptologiques;" Dr. Külbing, on "Teutonic Languages;" and papers on "English Metre," by Prof. J. B. Mayor and Mr. Alexander J. Ellis; on "Words, Logic and Grammar," by Mr. Henry Sweet; on "The Russian Language and its Dialects," by Mr. W. R. Morfill; and on "Traditional Relics of the Cornish Language in Mount's Bay in 1875," by Mr. H. Jenner.

THE first volume of Luigi Manzoni's *Bibliografia statutaria e storica italiana* has just been issued (Bologna: Romagnoli). It is entitled *Bibliografia degli statuti, ordini e leggi dei municipii italiani* (parte prima), and the preface contains an explanation of the method adopted by the author in the compilation of his important and laborious work.

THE late Dr. J. Charles Coindret of Geneva, who was a diligent collector of literary and historical rarities, has bequeathed nearly the whole of his treasures to the city of Geneva. Foremost among these must be reckoned the Rousseau collections, including Latour's portrait of Rousseau, the original manuscript of the *Emile*, the correspondence between François Coindret and Rousseau, and a number of manuscripts of the latter. He has also left his fine library to the city, with the exception of a few books, and a number of coins, medals, and pictures. Among the latter there is a portrait of Necker painted by Thouron upon a snuff-box, and a water-colour of a village in Kamschatka by the Bern painter Weber, who accompanied Capt. Cook in his voyage round the world.

THERE is a noticeable article in the *Canadian Monthly* for July, by the Acting Principal of the Government College, Jamaica, on "Force and Energy." The writer is evidently a very well read and able dialectician; but, as he informs us himself that he is not a practical experimentalist, the laity cannot be sure whether his grasp on physical facts is sure enough to warrant them in trusting his handling of physical conceptions. For instance, we should like to know what a professed physicist would think of his argument that if the planets, through secular retardation, should fall into the sun, they would have already parted with most of their energy, and that therefore the whole solar system would collapse into a dead mass, not into a new nebula. The general thesis of the article is that we should distinguish between force as what aggregates masses, molecules, atoms; energy, as what segregates the same; while kinetic energy represents the process of transfer of potential energy from matter to ether. If the distinction could be established, it would certainly be an advance on the current "anthropoponic" definition of energy as the power of performing work.

THE *Nuova Antologia* for August contains an article on Ennius, by Signor Rapisardi, which is directed against Mommsen's view of the absence of any poetic art among the Latins. Signor

Rapisardi maintains that the genius of poetry developed naturally among the Latins, but took shape from Greek intercourse. He compares the remains of Naevius and Ennius, and argues that both were affected equally by Greek influences, and that there is no ground for assigning to Naevius the position of the last of the old Latin poets. In the same magazine Signor d'Ancona begins a series of articles headed "Del Secentismo nella poesia cortigiana del secolo XV." He examines carefully the writings of Serafino, Cariteo, and Tebaldeo, with the view of tracing the gradual change of style that came over Italian poetry in the sixteenth century. There is also a careful enquiry by Signor Barnabei into the manufacture of maiolica at Castelli in the Abruzzo Terramano. He gathers together all mentions that have been made of it, and traces the names and dates of the principal artists employed.

THE first part of a very important work, entitled *Lapidarium Walliae*, in which the early inscribed and sculptured stones of Wales will be delineated and described by Professor J. O. Westwood, will be issued in a few weeks by the Clarendon Press. We take the following from the editor's prospectus:—

"The object of this work is to bring together into one volume descriptions and figures of all the early inscribed and sculptured stones scattered throughout the Principality of Wales. It is now more than thirty years since I commenced the search for these venerable relics of ancient times. The desire to investigate their palaeographical and ornamental peculiarities originated in the desire to discover how far many of them, which tradition had connected with the early British Church, agreed with the styles employed in, and corroborated the dates given to, the earliest religious MSS. known to have been executed in these countries. To these it had been usual, previously, to give the name of Anglo-Saxon, but a careful investigation of the MSS. of Ireland (published in my *Palaeographia Sacra*) had shown them to be of Celtic rather than of Teutonic origin. Sharon Turner's "Vindication of the Genuineness of the Ancient British Poems," published in the appendix to his *History of the Anglo-Saxons*, had further incited my curiosity in the same direction, while the establishment of the Cambrian Archaeological Association and the commencement of the *Archæologia Cambrensis*, in 1846, afforded greater facilities of research than could otherwise have been obtained. The last-mentioned publication, conducted from the first on the genuine principles of archaeological enquiry (so totally distinct from the dreamy lucubrations of the antiquaries of preceding ages), has, during the thirty years of its existence, brought to light a large number of the ancient stones of Wales; and it is with pride that I look back to the first volume of that work as containing palaeographical articles by myself on the Psalter of Rhyddmarch, by the Bishop of St. David's on the Hiberno-Saxon and Welsh peculiarities of the letter M, and the first announcement of the existence of Oghams in Wales, given in my account of the Kenfig Stone. The Cambrian Archaeological Association, having long since urged the publication of a general work embracing the whole of the early carved and inscribed stones of Wales, has at length resolved to issue them as a supplementary work to the *Archæologia Cambrensis*, in annual parts, similar to the work on the Irish Stones, issued as the annual volume of the Royal Historical and Archaeological Association of Ireland, chiefly from the materials collected by the late Mr. G. Petrie and edited by Miss Stokes, of which five parts are already published. It is supposed that the Welsh Stones will occupy three or four parts, at a price barely sufficient to cover the expense of publication. The work will be arranged in counties, the first part containing the stones of Glamorganshire, the earliest seat of Christianity in Wales, and the richest in respect to its lapidary remains."

WE have received *The Sun: Ruler, Fire, Light, and Life of the Planetary System*, by R. A. Proctor, third edition (Longmans); *Proceedings of the Royal Colonial Institute*, vol. vii., 1875-6 (published by the Institute); *Cracroft's Trustee's Guide*, twelfth edition (Stanford); *The Nicomachean Ethics of Aristotle*, newly translated into English by Robert Williams, second edition

(Longmans); *The History of Napoleon I.*, by P. Lanfrey, vol. iii. (Macmillan); *Imperial Federation of Great Britain and her Colonies*, ed. F. Young (Silver); *M. Tullii Ciceronis De Finibus Bonorum et Malorum Libri Quinque*: D. Jo. Nicolaus Madvigius recensuit et enarravit; editio tertia emendata (Williams and Norgate); *English Landscape Art: its Position and Prospects*, by A. Dawson, second edition (Chiswick Press).

NOTES OF TRAVEL.

AMONG the Reports by the Secretaries of Embassy and Legation most recently presented to Parliament will be found a long and very interesting account by Mr. Horace Rumbold of the progress and general condition of Chile. Mr. Rumbold is desirous in this Report to convey the notion that the community is one "sober-minded, practical, laborious, well-ordered, and respectfully governed," standing out in great contrast to the other States of kindred origin and similar institutions spread over the South American continent. The Chilean people have now attained a remarkable degree of prosperity, and their friendly critic cannot help thinking that they have lately shown some signs of the intoxicating effects of good fortune. This is particularly exemplified in the ambitious growth and luxury of the capital city of Santiago, which seem altogether out of due proportion to the power and resources of the country. Santiago is termed by its inhabitants, who number some 160,000, "the Paris of South America," but is more like "slices of Paris dropped down here and there in the midst of a huge, straggling Indian village." Chile seems to be the least military of South American countries, and few men of any standing are to be found among the army officers. The service, indeed, is not attractive, being confined chiefly to watching the Araucanian line, and chasing the Indian cattle-lifters who hang about that border.

THE *Times* announces that news of Colonel Gordon has been received in a communication dated Lardo, June 24, 1876. "From this source it appears that the White Nile splits up into two branches a little south of Lake Albert Nyanza. One branch flows past Lardo to Khartoum; the other, the newly-discovered arm, flows north-west, and joins one of the five rivers which flow into the Bahr Gazelle. This river in its turn enters the Lardo Khartoum branch of the Nile. Report says that there are no cataracts in the newly-discovered arm of the White Nile. In the old branch navigation is stopped by the Fola Rapids, which prevent any steamer passing from Khartoum to Lake Nyanza. If the rumour is true that the recently-found branch is navigable, Colonel Gordon's vessels will be able to steam from Khartoum to Nyanza. Should this be the case, all the previous military stations established by Colonel Gordon between Lardo and the Lake will have been to no purpose, and fresh stations must be formed along the Bahr Gazelle and the newly-discovered branch of the White Nile. Colonel Gordon is now busily engaged in the solution of this problem. Our readers will be glad to hear that he does not complain of bad health, in spite of his two years' sojourn in one of the deadliest portions of Central Africa."

AMONG recent books of travel not the least curious and in its way suggestive is *All the Way Round: or, What a Boy Saw and Heard on his Way Round the World*. (Sampson Low.) We frankly own that we are dumbfounded by the precocity of this awful little boy, who, at the age of eleven years, begins the narrative of his voyage round the world by supposing

we have heard of his grandfather, Mr. David Douglas Field's, account at New York of the same feat, with his wife and little grandson. "I am that grandson," writes little Master "Bouncer" in his first page, and anon records his adventures and impressions with an assurance that makes it clear he has never undergone the wholesome discipline of a public school or a grammar school. But then he hails from New York; and his grandsire was going to a social science congress in England, when, in a weak moment, his grandmamma interrupted his studies in order that he might bear them company. In gratitude, he was a zealous chronicler of her most casual remarks on the journey, and stuck to her with surprising tenacity even when, contrary to his advice, she ventured into a "dug-out," or scooped tree-trunk, manned by a native with two paddles, in the harbour of Bombay; and on its capsizing, they were "in a twinkling down in the bottom of the sea, with eyes and mouths filled with water" (see pp. 69, 70). The like tenacity seems to have been evinced when, in an earlier part of his travels, he wanted to see St. Peter's, while at Rome, and "was taken out of bed and carried there;" when, in visiting the Pyramids, he went to the top of Cheops, and only came down to lunch in the house built for the Prince of Wales; when he would not go to Abydos, in devout maintenance of his theory that "he did not care very much for ruins—he liked whole things best" (p. 37); and generally when, feeling a touch of home-sickness at the Suez Canal and elsewhere, he shook it off because—there was no remedy. According to this precocious traveller, the Taj Mahal Temple at Agra is the greatest wonder of the world; and because a poet and an American prose-writer have not succeeded in doing it justice, he felt bound to devote a chapter to it. Through India, Ceylon, China, Australia, the Islands of the South Sea, &c., those that list may follow this wonderful child, who, when riding on the engine of a railway train at Cairo, tells the engineer "all about our American railroads, which I happened to understand pretty well;" who held that it was good to mix some study with play, "to enjoy excursions so much the more;" and who chronicles *goody* stories, got from his grandmother, as occasion served: e.g., the story of the very good, pious woman, who, on the voyage from America, "one Sabbath afternoon took out her knitting-work," oblivious of the day of the week, and was "horrified when her daughter told her it was Sunday." In justice to Master Field, we must admit that he records no subsequent judgment, like that on Queen Charlotte's maid-of-honour, who pricked her finger with the needle wherewith she darned her stockings on Sunday, and, of course—died after it. But all that we read of this *enfant terrible* convinces us that, in the first place, it was a mistake to take him from his studies, and, in the second, a still greater to let him publish his adventures. The fault will be his grandparents' if a child—made didactic and self-sufficient in spite of himself in early youth—ripens in due course into a coxcomb and a bore.

FOREIGN REVIEWS OF ENGLISH BOOKS.

The EDITOR will be greatly obliged if the Publishers of foreign Journals will send him copies of those numbers which contain Reviews of English Books.

TICKNOR, George, Life, Letters and Journals of. (Sampson Low & Co.) *Polybiblion*, August.

LOCAL EXAMINATIONS IN THEOLOGY.

THE success of the Oxford and Cambridge local examinations has inspired the authorities of Manchester New College with the idea of similar ex-

aminations in Theology. It will be remembered that this college, formerly seated in Manchester, but now in London, is the only theological seminary in England entirely free from dogmatic or ecclesiastical restrictions. From two interesting papers which have reached us we take the following particulars. The object of the proposed examinations is to induce young men engaged in business during the day, and young women who have finished their ordinary school education, to take up some branch of this subject, and study it, as far as is practicable, thoroughly and systematically. The professors of Manchester New College, calling to their aid in case of need such assistance as may be desirable, will act as examiners. The plan of operation will be as follows. Early in May of each year a subject of study under each of the five heads of—

1. Old Testament history and literature;
2. New Testament literature and theology;
3. History of the Church, especially in its more critical periods;
4. Rational grounds and truths of morals and religion;
5. New Testament Greek;

will be publicly announced, so that persons conducting classes in these subjects will be able to prepare their materials during the summer holidays. At the end of March the lecturers will send in to the secretary (Rev. O. T. Poynting, Fallowfield, Manchester) the number of those who will be prepared to be examined, and the subject or subjects of each candidate.

The examinations will be strictly simultaneous, and will be held as near the end of April as possible. The standard of proficiency required will not be higher than may be fairly reached by young persons of sixteen years and upwards, who have pursued a suitable course of theological study during the winter months preceding the examinations. In the first four branches an *English* knowledge only of the subject will be required. It is expressly stated that the object of these examinations is to test the student's learning, not their orthodoxy, and that no answer will be rejected on grounds of opinion, if it exhibits faithful study and reverent thoughtfulness. The names of successful candidates will be arranged in two divisions in alphabetical order, and college certificates will be delivered to the candidates.

The subjects for the local theological examinations in April, 1877, will be:—

Branch I. The Book of Deuteronomy in connexion with the development of the religion of Israel. *Text Book*: Kuenen's *Religion of Israel*, chaps. I.–VI.

Branch II. The Epistle to the Galatians, with the corresponding passages in the Book of Acts. *Text Book*: Jowett's *Epistles of St. Paul*, from the introduction to the Galatians to the end of the Essay on St. Paul and the Twelve.

Branch III. Preparation for the Christian period. *Text Books*: Ewald's *History of Israel*, Vol. V., sec. ii. (with aid from Stanley's *Sinai and Palestine*).

Branch IV. Butler's three Sermons on Human Nature, with dissertation on the nature of virtue, and prefaces in Whewell's edition; Dugald Stewart's *Outlines of Moral Philosophy*.

Branch V. Gospel of St. Mark, translation and grammatical analysis.

It is to be understood that the examinations will not be limited to a knowledge of the text-books, though a competent knowledge of the text-books will be expected of all candidates. We wish well to this well-intended endeavour to spread a sounder knowledge of the fundamental facts of theology, though we could wish that two text-books had been specified in each branch instead of one. The onesidedness of the ordinary theological examinations is notorious; would a student be any the worse for knowing how the facts of theology present themselves to different classes of scholars?

THE CASKET LETTERS AT HATFIELD.

(Second Article.)

THE second of the Casket Letters preserved at Hatfield is alleged to have been written from Stirling, with reference to the plot for carrying off the Queen, which was executed a few days afterwards. This letter was printed at the time both in Scotch and in French, and, believing the former to be the original, I will place it first before the reader as follows:—

"Allace! my lord, quhy is your traist put in ane persoun sa unworthie, to mistrust that quihik is bailley youris? I am wod. Ye had promist me that ye wold resolve all, and that ye wold send me word every day quhat I suld do. Ye haif done nathing yairof. I advertisit yow weill to tak heid of your fals brother in law. He come to me and without schawing me onything from yow tald me that ye had willit him to wryte to yow that I suld say and quhair and quhen ye suld cum to me, and that that ye suld do tuiching him, and thairupon hes preichit unto me yat it was ane fulische interpryse and that with myne honour I culd never marry yow, seeing that being maryit ye did cary me away and yat his folkis wald not suffer it, and that the lordis wald unsay yames-lis, and wald deny that they had said. To be schort, he is all contrarie. I tald him that seing I was cum sa far gif ye did not withdraw yourself of yourself, that na perswasoun, nor doith itself, suld mak me fail of my promise. As tuiching the place ye are to negligent pardoun me, to remit yourself thairof unto me. Cheis it yourself, and send me word of it, and in the meane tyme I am seik. I will differ, as tuiching the matter it is to lait. It was not lang of me that ye have not thoct thairupon in time. And gif ye had not mair changeit your mynd sen myne absence, then I have ye suld not be now to ask the resolving. Weill, thair wants nathing of my part, and, seing that your negligence does put us buith in the danger of ane fals brother, gif it succedet not weill, I will neuer ryse agane. I send this beirar unto yow, for I dar not traist your brother with thir letteris, nor with the diligence. He shall tell yow in quhat stait I am, and judge ye quhat amendments thir new ceremonies have brocht unto me. I wald I wer deid, for I se all gais ill. Ye pramisit uther maner of matter of your foirseing; bot absence has power over yow qua haif twa stringis to your bow. Dispatch the answer that I fail not, and put na traist in your brother for this interpryse, for he has tald it, and is also all agais it. God give yow gude nicht."

The French version of this letter, published in 1571 in the French edition of Buchanan's *Detection*, was as follows:—

"Monsieur helas! pourquoi est vostre fiance mise en personne si indigne pour soupconner ce qui est entierement vostre? J'enrage. Vous m'aviez promis, que vous vous resouldriez en toutes choses et que chacun jour vous m'enverriez dire ce que j'auroye a faire. Vous n'en avez rien fait. Je vous veux bien advertir que vous prenriez bien garde a vostre desloyal beau frere; il vint vers moy sans me faire apparostre que c'estait de vostre part et me dit, que vous l'aviez requis qu'il vous escrivit ce que je vous voudroye dire et ou et quand je pourroye aller a vous, et ce que vous deliberiez faire de luy; et sur cela il me remonstra que c'estait une folle entreprise, et que pour mon honneur je ne vous pouvoye prendre a mary puis que vous estiez marié; ny aller avec vous et que ses gens mesmes ne le suffiroient pas, voir que les seigneurs contrediroient a ce que en serait proposé. Bref, il semble qu'il nous soit du tout contraire. Je luy respondy, veu que j'on estoye venue si avant, que si vous ne vous retractiez, nulle persuasion, non pas mesmes la mort, me feroit manquer a ma promesse. Touchant la place, pardonnez moy, si je vous dy que vous estes trop negligent de vous remettre a moy. Choisissez la donc vous mesmes et m'en advertissez. Cependant je ne suis a mon aise, car il est ja trop tard, et n'a pas tenu a moy que vous n'y ayez pensé de bonne heure. Et, si vous n'eussiez changé d'opinion depuis mon absence, non plus que moy vous ne demanderiez maintenant d'en estre resolu. Tant y a qu'il n'y a point de faute de ma part et en cas que vostre negligence ne nous mette tous deux au danger d'un desloyal beau frere, si les choses ne succedent, jamais ne puisse je bouger de ceste place. Je vous envoie ce porteur, d'autant que je n'ose com-

mettre ces lettres a vostre beau frere qui n'usera aussi de diligence. Il vous dira de mon estat. Jugez quel amendement m'ont apporté ces nouvelles ceremonies. Je voudroye estre morte, car je voy que tout va mal. Vous me promistes bien autre chose par vos premieres promesses; mais l'absence a pouvoir sur vous qui avez deux cordes en vostre arc. Depechez vous de me faire reponse, afin que je ne faille, ne me voulant fier en vostre frere, car il en a bahillé et y est du tout contrain. Dieu vous donne la bonne nuit."

Let us now consider for a moment the circumstances under which this letter is alleged to have been written. On Saturday, April 19, 1567, Bothwell, after entertaining the leading nobles of Scotland at supper, obtained their consent to his marriage with the Queen. On that day they signed the famous bond pledging themselves to aid Bothwell to the uttermost in his daring scheme. On the following Monday, April 21, Mary repaired to Stirling to visit her infant son, who had been consigned to the care of the Earl of Mar. She was accompanied by the Earl of Huntly, the brother-in-law of Bothwell, and by various other persons of note. She remained two nights at Stirling and one night at Linlithgow; and on April 24, while returning to Edinburgh, she was met by Bothwell at the head of a thousand horsemen. We have no account of what passed between them, except from Mary herself. She says that when Bothwell rode up he assured her that she was in the utmost danger, and that he forthwith escorted her to the castle of Dunbar. As he was Sheriff of the county of Edinburgh, it would no doubt have been his duty, if he had told the truth, to provide for her safety. But among the Casket Letters three were produced at Westminster to prove that Mary was an accomplice in Bothwell's plan for carrying her off; and this is the first of the three. If, however, Mary was a party to the plot, it is inexplicable why the place and the manner of the seizure should have been left in such utter uncertainty as this letter would lead us to suppose. It was alleged to have been written on the very day on which she set out from Edinburgh. She unquestionably left Bothwell there; and common sense would suggest that, if they had been acting in concert, they would have arranged the time, the place, and the manner of the seizure before she set out on her journey. Buchanan seems eventually to have perceived this; for, although he published this letter in his *Detection* in 1571 to prove that the plan of the seizure had not been arranged before the Queen left Edinburgh, he gave it a flat contradiction in his *History*, which was published a few years afterwards. In the *History* he states distinctly that everything had been settled before the Queen commenced her journey. "*Antequam Edinburgo discessisset*," he says, "cum eo transgerat ut ipse revertentem ad Almonis pontem eam raperet, ac secum, quo vellet, velut per vim abduceret" (*Hist. Scot.*, lib. xviii.).

I come now to the Hatfield version of this letter, which is a contemporary document written in French, but not in the French originally published. My explanation of this fact simply is that both are translated from the Scotch, but by different hands. The variations between the two show plainly that the one is not a copy of the other. I shall mark these alterations in italics, and the reader will perceive at a glance the difference between the two versions:—

"Monsieur helas! pourquoi est vostre fiance mise en personne si indigne, pour soupconner ce qui est entierement vostre. J'enrage. Vous m'aviez promise que resouldriez tout et que me manderiez tous les jours ce que j'aurois a faire. Vous n'en avez rien fait. Je vous advertise bien de vous garder de vostre faux beau frere. Il est venu vers moy et sens me monstrier rien de vous, me dist que luy mandiez qu'il vous escrivo ce qu'aurez a dire, et ou et quant vous me trouveriez, et ce que faires touchant luy, et la dessus m'a presché que c'estoit une folle entreprise et qu'avecques mon honneur je ne vous pourriez jamais espouser, veu qu'estant marié vous

m'amenerés et que ses gens ne l'endurcroient pas et que les seigneurs se dedroient. Somme, il est tout contrain. Je luy ay dist qu'estant venue sy avant, sy vous ne vous retiriez de vous mesmes, que persuasion ne la mort mesme ne me feroient faillir a ma promesse. Quant au lieu, vous estes trop negligent (pardonnés moy) de vous en remettre a moi. Choisissez le vous mesme et me le demandés. Et cependant je suis malade. Je différeray. Quant on propose, c'est trop tard. Il n'a pas tenu a moy que n'ayés pensé a heure. Et si vous n'eussiez non plus changé de pensée depuis mon absence que moy, vous ne seriez a demander telle résolution. Or il ne manque rien de ma part; et puisque vostre negligence vous met tous deux au danger d'un faux frere, s'il ne succede bien, je ne me relèveray jamais. Je vous envoie ce porteur, car je ne ose me fier a vostre frere de ces lettres; ni de la diligence. Il vous dira en quelle estat je suis, et jugés quelle amendement m'a porté ces incertains nouvelles. Je voudrois estre morte; car je vois tout aller mal. Vous promettiez bien autre chose de vostre providence; mais l'absence peult sur vous qui avez deux cordes a vostre arc. Depechés la response afin que je ne faille, et ne vous fies de cette entreprise a vostre frere; car il l'a dist et si y est tout contrain. Dieu vous doint le bon soir."

It will be seen that this letter adheres much more closely to the Scotch than the version originally published in the *Detection*; for example, we find in the second sentence in the Scotch, "Ye had promist me, that ye wold resolve all," and in the Hatfield copy an exact translation, "Vous m'aviez promise que resouldriez tout." But the copy of the *Detection* says that Bothwell had promised to resolve himself—"que vous vous resouldriez en toutes choses." Then we read in the Scotch, "He came to me and without schawing me onything from yow," and in the Hatfield copy, "Il est venu vers moy et sens me monstrier rien de vous." But in the *Detection* we find this passage rendered thus: "Il vint vers moy, sans me faire apparostre que c'estoit de vostre part." Further on we read in the Scotch, "Seing that being maryit ye did cary me away;" in the Hatfield copy, "Veus qu'estant marié vous m'amenerés," while in the *Detection* an entirely different meaning is given—"puis que vous estiez marié; ny aller avec vous." Towards the close of the letter we find in the Scotch, "Ye promist uther maner of mater of your foirseing," and in the Hatfield copy, "Vous promettiez bien autre chose de vostre providence;" but in the copy of the *Detection* the meaning is entirely different, thus, "Vous me promistes bien autre chose par vos premieres promesses."

There are several omissions and mistakes in the Hatfield letter which afford additional proof that it is a mere translation. The words, "I am wod" (mad), which conclude the first sentence, are omitted; probably because the translator did not understand them. But in the margin "j'enrage" has been added by another hand totally different from that in which the letter is written. Further on the translator omits an essential word. The passage in the Scotch, "that na perswasoun nor death itself," &c., is rendered "que persuasion ne la mort mesme," &c. It ought to have been "nulle persuasion," as we see it has been rendered in the copy of the *Detection*. Another palpable blunder occurs towards the end of the letter, thus, "Vostre negligence vous met tous deux au danger," &c., instead of "nous."

One word as to the Earl of Huntly. The writer of this letter represents him as being resolutely opposed to the daring schemes of Bothwell; but history tells us the reverse. We have abundant proof that Huntly was at this time an active confederate of Bothwell. He had signed the bond for the marriage of the Queen, although Bothwell was at the time the husband of his sister. He was present when the Queen was intercepted by Bothwell, and with Bothwell he accompanied her to Dunbar. This letter, therefore, which represents Huntly as being strenuously opposed to Bothwell's scheme, seems to be a pure fabrication. And we can only account for the existence of the two different French versions

by concluding that both are translated by different hands from the Scotch original.

JOHN HOSACK.

LETTER FROM PEKING.

Peking: May 31, 1876.

Peking has lately been the scene of great agitation. The degree of Doctor of Literature has been awarded to about two hundred candidates out of nearly ten thousand. They are collected from all parts of the empire. Many are the adventures which some of them meet with on their way to the capital. A few days ago, a memorial from the Viceroy of this province, Li hung chang, appeared in the Gazette, which announced the plunder by banditti of three Masters of Arts coming from the extremity of the empire, Yunnan. They had almost reached Peking and were travelling in company, each in his two-mule cart, when they were set upon by bandits and robbed of silver to the amount of 300*l*. The Viceroy and the Court are exceedingly angry at the magistrate of the district where this robbery occurred for not catching the thieves, and he is consigned to the Board of Punishments to have his case considered.

The examination was conducted in the Kung ruen, where 9,999 cells are occupied by the candidates, should they be as many. There are eighteen subordinate and three chief examiners. The greater part of the essays are condemned to the waste paper basket, when they pass under the eye of the subordinates, who inscribe the word "recommended" upon good essays. The essay must consist of 700 and less than 800 Chinese characters, written on regulation paper. The mottoes of the essays are selected from the Four Books and Five Classics. The writers must not introduce anything from the adjoining text. The essay must be an expansion exclusively of the motto itself.

When the essays are given in, the names of the writers, in the right-hand corner, are folded in and sealed. The essays are then copied, and kept for reference. The copies are compared with the originals by readers. They are upon red paper, and when ready are handed to the chief examiners.

A fixed number are admitted to the degree for each province. When the candidates have all arrived and given in their names and residences, the Emperor appoints that such and such a number shall be admitted to the degree of Tsin she for each province. The number he appoints is in proportion to the number of applicants. A door is opened in this way for the Manchus of Peking to attain high literary rank. They compete not with scholars from the provinces so much as with each other.

The essays being copied, the examiner cannot know whose they are, except by some indication in the order and selection of the characters. Occasionally it happens that some one of the chief examiners is capable of being bribed. In that case he may be informed that certain characters will occur in the essay in a given position. In the year 1856 some man, formerly a play-actor and on this account legally disqualified from taking a degree, succeeded in passing. One of the chief examiners was accused of receiving a bribe of 500 ounces of silver and condemned to death. The sentence was carried out, and the excitement produced in Peking at the time was intense. This was partly because Sushun, whose influence was then paramount with the emperor Hien feng, was a personal enemy of the accused examiner, and partly because the trial was irregularly conducted, it being held at the prefect's office instead of at the Board of Punishments. The people took notice that the highest post in the prefect's office was filled by a creature of Sushun. At the beginning of the next reign Sushun himself, after an administration equally unsuccessful and unpopular, was pitilessly decapitated by command of the empresses.

After the examination for Tsin she, a subsequent one for honours is conducted. This takes place in the palace, in the chief Hall of Ceremony, the Tai ho tien. The new doctors are here examined afresh, and that one of the two hundred or more who reaches the first rank is called Chwang yuen. His good fortune is the occasion for the most extraordinary joy in his native place, and on the part of all his friends. He is allowed as a special distinction to ride on horseback through the courts and gateways of the palace on his way back to his lodging. The second, third, and fourth doctors in the list for honours have also special literary titles conferred on them.

By the display of ability on this occasion all the more successful candidates find their fortunes made. They are sure of good promotion, and enter the civil service with bright prospects.

The new doctors were ordered to be presented to the boy-emperor in batches of forty at a time on six successive days. This ceremony is now going forward on each morning. The empress regent sits behind a curtain, near the emperor, who though only six years of age, occupies the throne, which is a broad divan cushioned with yellow satin. Here the emperor sits cross-legged each morning from four o'clock till seven—or six, if business is not pressing. In Peking, the great Court officers must all get up early. So also must the empresses. Thousands of subordinate officers, eunuchs, and attendants must be out of their beds long before four o'clock. The healthful custom of early rising has been favoured by the Chinese Court through all past time.

A few of the successful essays are published for distribution among friends of the new doctors.

In the scarcity of new books, literary essays satisfy a certain want. But they are only specimens of clever writing, and make no additions to knowledge. They are simply invested with some interest on account of their having been fortunate enough to win the favour of the examiners, and as specimens of the sort of work that must be done by the next batch of aspirants to literary honour.

There is afterwards a presentation of imperial gifts to the new Chwang yuen, and all the new doctors. The senior wrangler of the year appears in a hat, collar, and sash, and all the doctors in new robes.

There is also an *al fresco* dinner at the Board of Ceremonies, given by the emperor. The president and secretaries of the Board here entertain all the new graduates in the principal square of their office. The ordinary state of dust and semi-ruin which distinguishes the lonely halls of the Board of Ceremonies is for the day disguised by red cloth and silk trappings.

With the recollection of this last manifestation of imperial grace in the form of good eating and drinking, the graduates proceed to their new duties, for the discharge of which they are retained in the capital.

A Diplomatic Guide is now being printed at the Foreign Office press, for the use of ambassadors and their suites travelling in foreign countries, or resident there.

The French Professor of Chemistry is translating the Code Napoléon.

The Professor of Russian and German is preparing a dictionary of Russian, German, and Chinese.

The American Professor of English is translating Fraser Tytler's *Manual of Ancient History*.

These works will all probably, when completed, be printed at the Foreign Office press, under the eye of the Principal of the College, Dr. Martin.

SCIENCE.

Illustrations of the Centimetre-Gramme-Second (C. G. S.) System of Units. By J. D. Everett, M.A., D.C.L., F.R.S.E., Professor of Natural Philosophy in Queen's College, Belfast. Published by the Physical Society. (London: Taylor & Francis, 1875.)

At the meeting of the British Association in 1872 a committee was appointed for the selection and nomenclature of dynamical and electrical units, and in 1873 and 1874 the reports of the committee were presented to the Association. In the first report the committee

"recommended the general adoption of the Centimetre, the Gramme, and the Second as the three fundamental units; and until such time as special names should be appropriated to the units of electrical and magnetic magnitudes hence derived, they recommended that they be distinguished from 'absolute' units otherwise derived, by the letters 'C. G. S.' prefixed, these being the initial letters of the names of the three fundamental units."

The committee proposed special names for two derived units, *dyn* (from the Greek δύναμις) for the C. G. S. unit of force; and *erg* (from the Greek ἔργον) for the unit of work. In their second report they expressed the belief that in order to make their recommendations fully available for science teaching and scientific work, a full and popular exposition of the whole subject of physical units was necessary, together with a collection of examples, illustrating the application of systematic units to a variety of physical measurements.

The volume before us, drawn up by Prof. J. D. Everett, the Secretary of the committee, is designed to meet this want. Though the volume is small, its scope is by no means narrow, and its rich lists of tables and data, all reduced to one uniform scale, will be hailed as a real luxury by those physicists who know from experience with what labour and weariness the conversion of physical data from one set of units to another is attended. The examples, which as a rule are appended to each chapter, and form a valuable adjunct to the text, will aid in impressing upon the mind of the student correct ideas on the subject of dimensions

and units, which are frequently found so difficult to grasp.

For the simplification of language, and for fixing definite notions in the mind, it would be a great advantage to have special names reserved for the more important of the derived units. Practical electricians have already brought into general use several such names—electrical resistance being expressed in ohms, capacity in farads, electromotive force in volts, &c. This work of Prof. Everett, which may be looked upon as embodying and amplifying the report of the British Association Committee, suggests only two new names, *dyne* and *erg*, above referred to, but doubtless we shall, in the course of time, have special names for other important units, both in the science of electricity and in other branches of physical research. The little volume before us, though not so complete as it will probably be made in later editions, will prove to be of the greatest service to the scientific calculator, and Dr. Everett deserves the best thanks of physicists for the work he has so successfully accomplished.

The *Illustrations of the C. G. S. System of Units* is published by the Physical Society, a Society which, though able to count little more than two years from its birth, is already beginning to rival in vigour, and more than rival in attractiveness, many of its older sisters.

In the first chapter of the book we find a complete account of the general theory of fundamental and derived units, and of dimensional equations. The dimensions are given of such magnitudes as velocity, acceleration, momentum, density, force, work, energy, angle, angular momentum, stress, strength of a centre, curvature, tortuosity, &c.

The question of the selection of units is then discussed. The reason which guided the committee in selecting the centimetre and gramme, rather than the metre and gramme, was that, since a gramme of water has a volume of approximately one cubic centimetre, the former selection makes the density of water unity; whereas the latter selection would make it a million, and the density of a substance would be a million times its specific gravity, instead of being identified with its specific gravity as in the C. G. S. system. Only one member of the committee dissented from this view, the grounds of his objection being that the centimetre is far too small, and leads to units of force and work which are so small as to be seriously inconvenient.

This objection will be deemed to have less weight when it is remembered that the exclusive adoption of any common scale necessarily involves the frequent use of very large and very small numbers. Whatever system of fundamental units be adopted, some of the derived units must be very large or very small. Such numbers are most conveniently written by expressing them as the product of two factors, one of which is a power of 10, the resolution being effected in such a way that the exponent of the power of 10 shall be the characteristic of the logarithm of the number. Thus 3240000 will be written 3.24×10^6 , and .00000324 will be written 3.24×10^{-6} . Very large and very small numbers being always written on this

plan, it appears to us that the disadvantage of their use is sensibly diminished.

We may remark that throughout the book no definition is given of a "gramme." A gramme is defined in the common text books as the mass of a cubic centimetre of distilled water at 4° C. under atmospheric pressure; from which definition it follows that the density of distilled water at 4° is unity, a cubic centimetre being the unit of volume. At page 18, however, the absolute density (in grammes per cubic centimetre) at 4° is stated—in accordance with the observations of Kupffer as reduced by Prof. W. H. Miller—to be not 1 but 1.000013. Hence water has the unit density when its temperature is not 4°, but between 2° and 3°, or between 5° and 6°. It should have been stated how it comes to pass that the density of distilled water at 4° is not equal to unity.

The unit of force—the dyne—is that force which, acting upon the unit of mass (a gramme) for the unit of time (a second), generates the unit velocity (a velocity of a centimetre per second).

The unit of work—the erg—is the amount of work done by a dyne exerted through a distance of a centimetre.

The standard pressure usually adopted in scientific work is the pressure of 76 centimetres of mercury at 0° C. It is obvious that this pressure is not absolute, since the weight of the mercury column depends upon the value of *g*, which varies with the locality. Hence the commonly adopted standard denotes different pressures at different places. At London it is 1.0138×10^6 (dynes per square centimetre), and at Paris 1.0136×10^6 . At London the height which would give a pressure of 10^6 is 74.964 centimetres or 29.514 inches. Prof. Everett proposes that this pressure should be adopted as the standard atmosphere. Calculation would thereby be greatly facilitated. Our standard pressure would thus be the pressure of a megadyne (i.e., a million dynes, the prefix *mega* denoting multiplication by a million) per square centimetre.

The subject of Heat has a larger place assigned to it than the subjects of the chapters which precede it—Astronomy, Acoustics, and Light. Questions relating to thermal capacity, thermal conductivity and emission, are fully treated and illustrated. Calculations connected with change of units in the case of conductivity are the more difficult for students, from the fact that the unit of heat adopted is sometimes the heat required to raise unit mass of water one degree, and sometimes the heat required to raise unit volume of water one degree.

Scarcely two observers have adopted the same units in their researches on Conductivity. Principal Forbes's results for the conductivity of iron are expressed in terms of the foot and minute, the thermal capacity of a cubic foot of water being unity. Sir William Thomson employs the same units except that he substitutes a second for a minute. Prof. Everett's results, obtained from the Greenwich underground thermometers, are in terms of the French foot and the year. Ångström employs as units the centimetre and the minute, Peclet the

metre and second. In the book before us we are able to compare at once the results arrived at by all these various observers, since they are reduced to one invariable scale.

The last two chapters—on Magnetism and Electricity—will be found to be among the most useful in the book. In the former Prof. Everett presents the dimensions of the various magnetical magnitudes in such an order that the reader is enabled to trace the dimensions of any particular magnitude he may require by following the series back to the fundamental units through the dyne. Thus, the unit magnetic pole is defined to be that which repels an equal pole at the distance of 1 centimetre with a force of one dyne. From this definition the dimensions of pole (or strength of pole) are at once obtained. The intensity of magnetic field is the force which a unit pole will experience when placed in it. Hence the force on a pole *P* will be intensity of field $\times P$. Thus the dimensions of intensity of field are obtained from those of pole and force. The work required to move a pole *P* from one point to another is the product of *P* by the difference of magnetic potentials of the two points. Hence the dimensions of magnetic potential are obtained from those of pole and work.

The same plan is followed in the case of the electrical units. Here it was necessary to distinguish between electrostatic and electromagnetic units, and this distinction has been very carefully and lucidly brought out by the author. The electrostatic unit of quantity is analogous to the unit magnetic pole. It is that quantity of electricity which repels an equal quantity at the distance of one centimetre with a force of one dyne. The remaining electrostatic units are those of potential, capacity, current, resistance, and electrical force. The dimensions of the fundamental electromagnetic unit (current strength) are obtained directly from those of magnetic field-intensity, the relation between the two being given by a tangent galvanometer of given form and construction. The dimensions of the other electromagnetic units, quantity, capacity, electromotive force and resistance, are deduced from those of current. The ratio of the two units of quantity—electromagnetic and electrostatic—is found to have the same dimensions of velocity and is equal to 3×10^{10} C.G.S. units of velocity.

In Art. 131 Prof. Everett investigates the units of length, mass, and time, such that this ratio may be equal to unity, or in other words that the electrostatic may be equal to the electromagnetic units. It is shown that

The new unit of time will be about $1^h 5\frac{1}{2}^m$.

The new unit of length will be about 118 thousand earth quadrants.

The new unit of mass will be about 2.66×10^{14} times the earth's mass.

A. W. REINOLD.

Der Platonische Staat. Von A. Krohn. (Halle: Mühlmann, 1876.)

This very curious and really instructive book may be best described as an attempt to apply to the Platonic canon the same principles of criticism which the school of

Tübingen has applied to the canon of the New Testament; it is not the author's fault that he has not been able to find a starting-point for his investigation which his opponents would be obliged to treat as respectfully as the opponents of the Tübingen school must treat the four test Epistles. It is not a matter of theory that St. Paul wrote the four test Epistles; it is a matter of theory that the *Memorabilia* of Xenophon, as we have them, are interpolated, and that the only genuine part of them is the account of Socrates' positive teaching, which was Xenophon's real "apology" for his master, and that the "apology" which we now have is a supposititious work coined when the real *Apology* had been interpolated into the *Memorabilia*. Dr. Krohn has expounded this thesis in a separate work, which I have not seen; but, as Xenophon's writings are generally regarded with more or less suspicion, it is not improbable that Dr. Krohn's view of the *Memorabilia* might gain acceptance with or without modification. To judge by the *résumé* of his argument in the present work, there really seems reason to think that it might be possible to reconstruct a book out of the *Memorabilia* which should answer better to Xenophon's programme, and do more credit to Socrates' memory, than the *Memorabilia* do as they stand. In the present state of opinion on such subjects, of those who had gone as far as this more might be inclined to decide that the book had been interpolated than that the author had enlarged it. But there is a great difference between admitting a theory of this kind as a *terminus ad quem* and admitting it as a *terminus a quo*: and it is this last admission which Dr. Krohn demands. According to him, Socrates was before everything else a social reformer whose originality lay in this, that he based his political hopes on a positive ethical doctrine. Plato found a psychological basis for this doctrine, and developed his psychology into a scheme of transcendental mysticism; the whole of which process is still to be traced in the *Republic*: the ironical, sceptical side of Socrates, both in "Plato" and "Xenophon," is to be set down to the ingenuity of Epigoni, who worked up the hints of their masters; the dialectical side of Platonism may be due either to the exaggerations of disciples or to the failing judgment of the teacher.

All this is very startling, and a great deal of it is very arbitrary. For one thing, Dr. Krohn simply refuses to see that Socrates looked at the relation of the sexes from a Greek, not from a Christian, point; for another, he has very little literary perception, and when he has proved that Plato's *Dialogues*, as we have them, come short of logical consistency and symmetry, he thinks he has proved that the universal esteem of Plato as a great artist is a superstition that rests on nothing better than the admirable style of the *Republic*. A still more general presumption against his scepticism might be drawn from a principle of his own, for Dr. Krohn has a very strong and refreshing sense of the truth that speculation ought, upon the whole, to be subordinate to practice: it is a corollary of this that criticism, upon the whole, ought to be subordinate to

tradition, for a demonstration of the necessity of believing everything that is believed ought to be as superfluous as a demonstration of the advantage of doing everything that is done. Moreover, if we admit the existence and authority of Xenophon's *Apology* in the shape to which Dr. Krohn would restore it as something incontestable, still it is possible to draw overstrained inferences from the most incontestable facts. Granting that the *Memorabilia* are largely interpolated, they may have been interpolated by a writer with much second-hand knowledge of Socrates, independent of Xenophon's book. It is surely uncritical to disbelieve everything about an historical character which is not stated by a professed apologist, even when the apologist is the best authority we have; and the question always remains to what charges the apologist means to reply. Such an apology as Dr. Krohn supposes Xenophon to have written would have been very well fitted to meet the case of people who disliked the elenchus without understanding it and would be reassured by learning that Socrates gave his pupils who really knew him sound practical advice; but then we should still be left to find out how an earnest practical moralist came to deal so largely in barren and unsettling dialectic. But although it is impossible to approve Dr. Krohn's method of criticism, which consists largely in setting up cheap objections against all data which it requires any mental effort to connect with the fixed points which he has selected, it is certain that his analysis of the *Republic* contains much that is unfamiliar and worth attention. We may refuse to believe that the *Republic* was the only monument of Plato's life, or the only one that is worthy of him, but we pass over much when we regard it simply as a part of his works, as a stage in his philosophy instead of a whole in itself and the record of more than one stage of his development. We know that the order in which the successive additions to *Faust* stand in the completed work is not a guide to the order in which they were composed; and there is really no reason for supposing that the eighth and ninth books of the *Republic* are later than the sixth and seventh, or even than the fifth, for, as Dr. Krohn correctly remarks, we find no trace of anything but ordinary family relations in the description of the transition from the perfect State to the timocratical, and the decline of education refers exclusively to the account of education given in the third book; and it is certainly very hard to suppose that Plato had a theory of ideas *in petto* when he was tracing out the psychological effects of the traditional education which he proclaimed to be perfect if rightly used, because, as Dr. Krohn points out, the upper classes in Greece needed education only to form character—their intelligence might be trusted to take care of itself. Nor, when Plato was occupied with the conception of *φύσις* as a paramount and sufficient guide to *πολιτική*, the highest science, can we think that he already had formed a conception of a transcendental antithesis between the sensible and the intelligible, in the light of which the world of sense and its practical occupations were reduced to the shadows of the cave.

We may even follow Dr. Krohn in the distinction which he draws between the cheerful idealism of the sixth book and the rather depressing and overstrained mysticism of the seventh, though it is hard to determine *a priori* whether both may not be different sides of the same view of things. At any rate, the author is on surer ground in the concluding section of the book, where he points out how closely the oldest parts of the *Republic* correspond to the Socratic programme as described in Xenophon, though he fails to notice that some of the coincidences he introduces from the later books are put into the mouth of Glaucon as coming short of the true Socratic spirit. On the other hand, his treatment of the doctrine of immortality in the tenth book is most unsatisfactory; the discussion of the symbolism is wooden and not even irreproachably correct, and the author actually allows himself to deny that *κατὰ τὴν εἰσθύναν μέθοδον* is an allusion to the inductive idealism of other dialogues. Dr. Krohn's present work is only the first volume of *Studien zur Sokratisch-Platonischen Literatur*; it is to be wished that before another volume appears he may make the acquaintance of Prof. Jowett's *Plato* (at present he seems to have studied no English Platonist but Grote), and the more subtle and sympathetic method of the Master of Balliol might perhaps lead him so to recognise the bearing of his own original and suggestive enquiries upon the whole subject of Platonic literature as to present their results in a less paradoxical and unacceptable form. G. A. SIMCOX.

SCIENCE NOTES.

ASTRONOMY.

Celestial Photography.—At a recent sitting of the Académie des Sciences, M. Cornu exhibited specimens of photographs of the sun, moon, and planets, taken with a refractor of fifteen inches' aperture, which he had specially adapted to photographic work by the device of separating the two lenses of the object-glass. By this means the correction for achromatism is altered, so that the greenish-blue and ultra-violet rays, which are the most important for photographic purposes, are united instead of the scarlet and greenish-blue, the combination which gives the best result for optical observations. M. Cornu has succeeded in making this alteration in a very simple manner, allowing the lenses to be separated or brought together again readily, according as the instrument is required for photography or ordinary observations; the only change of importance being a shortening of the focal length by some six or eight per cent. M. Cornu's experiments were carried out at the Paris Observatory with a telescope originally constructed for Arago, and quite recently restored and put into proper order for use in M. Cornu's determination of the velocity of light.

Discovery of Nebulae.—The Foucault reflector of the Marseilles Observatory (under M. Stephan's direction) has been devoted for some time past to the search for nebulae, the result of which has been the discovery of 400 of these bodies. Most of them are extremely small, as was to be expected from the circumstance of their having escaped the notice of previous observers, and their positions could therefore be determined with considerable accuracy, a point of great importance for the investigation of their proper motions. M. Stephan has in every case compared the place of the nebula with that of a neighbouring star by means of the

filar micrometer, using the same care as in the case of a small comet, and great accuracy may therefore be hoped for. M. Stephan's recent observations are given in the *Comptes Rendus*.

The Satellite of Neptune.—Since the erection of the great refractor at Washington, observations have been made of Neptune's satellite, with the view of determining the mass of the planet in terms of the sun's mass, which can be done with great accuracy by comparing the time of revolution and the distance of the satellite from its primary with the corresponding quantities in the case of a planet revolving round the sun. Prof. Holden has discussed, in the *Astronomische Nachrichten*, the results thus obtained, finding the mass of Neptune to be 1-18500th part of that of the sun, or nearly double that of the earth, a value which is somewhat smaller than that found by Prof. Newcomb from his observations in 1873 and 1874, and much nearer the mean of the results obtained by previous observers.

The Tail of Coggia's Comet of 1874.—Taking advantage of Dr. Schmidt's observations, at Athens, of the direction of the tail of this comet, Prof. Bredichin has discussed the question of its position with reference to the plane of the comet's orbit, through which the earth passed on July 21. From Dr. Schmidt's observations it appears that the tail was then exactly in the direction of the radius vector from the sun, from which it follows that it lay in the plane of the orbit; and further, it was then perfectly straight, though sensibly curved and in opposite directions on the day preceding and the day following, a fact which shows that the curvature was entirely in the plane of the orbit. Prof. Bredichin has further found that the tail made an angle of 36° with the prolongation of the radius vector on July 20, and of 40° on July 22, lagging behind it, with reference to the direction of the comet's motion.

The Corona Line in the Solar Spectrum.—One of the important results of the solar eclipses of 1870 and 1871 was the discovery that the spectrum of the corona exhibited bright lines, showing that it was composed of glowing hydrogen, and of an unknown gaseous substance, whose presence was indicated by a bright line which corresponded in position with a certain absorption line in the solar spectrum. This dark line in the green is at 1474 of Kirchhoff's scale, and sensibly coincident with one of the short lines in the spectrum of iron, but as the more marked lines of iron are not found in the corona it can hardly be inferred that the corona line is due to the vapour of iron, especially as Mr. Lockyer has shown that the short lines—i.e., those found only in the immediate neighbourhood of the electrode—are due to some compound of the metal, and that it is only the lines which extend to some distance from the electrode that can be considered to belong to the metal itself in a free or uncombined state. In the June number of the *American Journal of Science* Prof. Young has set the question of the identity of the corona line with the line of iron at rest by the discovery that the "1474" line in the solar spectrum is really double, and that the narrower component belongs to the spectrum of iron, while the other is the true corona line. Of course, this discovery is only a small step towards determining the gas to which this latter is due, but at any rate it shows that there is no real connexion with the spectrum of iron, and thus clears the ground for future enquiry. Prof. Young has obtained this result by the use of a diffraction grating of lines ruled on a silvered-glass speculum, 8640 to the inch, observing the spectrum of the eighth order. In order to get over the difficulty caused by the overlapping of spectra of the higher orders, Prof. Young has introduced a prism in front of the observing telescope, having its refracting edge perpendicular to the slit, and therefore causing a separation of the colours in a vertical direction. In this way the red of the sixth order falls below the yellow of the seventh,

and this underneath the green of the eighth, while above this lies the blue of the ninth, and above that the extreme violet of the tenth.

Physical Observations of Saturn.—For four years past M. Trouvelot has had frequent opportunities of observing the planet Saturn under very favourable circumstances, and he has now communicated the results to the *American Journal of Science*. His most important conclusions are:—(1) That on the outer margin of the principal division between the rings some singular dark forms are seen on the ansae, which may be attributed to a jagged outline of the corresponding ring; (2) that the thickness of the system of rings increases from the inner margin of the dusky ring up to the principal division, as shown by the form of the shadow of the planet on the rings; (3) that cloud forms are to be seen on the rings, and that these change their position, as indicated by rapid changes in the indentation of the shadow; (4) that the dusky ring is not transparent throughout, but increases in density outwards, so that at about the middle of its width the limb of the planet ceases entirely to be seen through it. This is contrary to all observations hitherto made, and would therefore seem to indicate that a change has taken place in the last few years. M. Trouvelot's observations have been made with telescopes of six, fifteen, and twenty-six inches' aperture, and are therefore entitled to the more confidence from the variety in the optical means used.

A Nebula-Photometer.—Prof. Pickering has devised a photometer to measure the intensity of any part of a nebula, with a view of detecting changes of brightness. The principle is that of Dove's photometer, which is somewhat similar to that of Bunsen, the essential feature being a small film of translucent collodion (on a glass plate) placed at the principal focus of the telescope, and illuminated in front by the light of the portion of the nebula under examination, and behind by a lamp, the intensity of which can be decreased at will by two crossed Nicol prisms, or in other ways. The light is thus varied till the spot of collodion disappears from the equality of the illumination on the two sides, and the brightness of that portion of the nebula is thus determined in terms of the lamp as a standard. The brightness of the sky must also be determined and subtracted from the result found for each portion of the nebula.

BOTANY.

***Calluna vulgaris* in America.**—Dr. Asa Gray reports, in *Silliman's Journal*, the discovery of a new station in America for *Calluna vulgaris*. It will be remembered that up to about ten years ago it was universally believed that no species of heath existed in a wild state on the American continent. This same species had been sparingly collected in Newfoundland, which was regarded as its western limit. But in 1866, or 1867, Mr. Jackson Dawson discovered a patch of *Calluna* in Tewkesbury, Massachusetts. Naturally, botanists at first were doubtful as to its being really indigenous in this locality, though the fact of its occurrence in Nova Scotia and Cape Breton being soon afterwards recorded was almost conclusive. Subsequently an intermediate station on Cape Elizabeth, near Portland, Maine, was detected by Mr. Pickard, a Scotch gardener. We have now the satisfaction of recording a second station in Massachusetts, not far from the former one. Mr. James Mitchell, of Andover, is the present discoverer, and the station is in the western part of Andover, half-a-mile north-east of Hagget's Pond, and five miles north of the Tewkesbury Station. Mr. Mitchell accidentally met with this patch of the heath last summer, and, being a Scotchman, recognised it, took home a sprig of it, and, at a subsequent visit, grubbed up one or two small plants, which a neighbour still has in cultivation. Dr. Gray has examined fresh specimens from this locality, and says they are of the green and nearly

glabrous variety, precisely like the Tewkesbury plant. It should also be noted that this station, on the authority of the Rev. Mr. Wright, is near an extensive glacial moraine which traverses that district, and which has been traced for a great distance northwards.

***Pirus cordata* in Britain.**—In Trimen's *Journal of Botany* for the current month, Dr. Maxwell T. Masters endeavours to show that the *Pirus* described in the *Report of the Curator of the Botanical Exchange Club*, in 1871, as *Pirus communis* var. *Briggsii*, is identical with *P. cordata* of Desvaux. The present distribution of this form is very interesting in connexion with the migrations of peoples and plants. The British station is near Plymouth, and the same, or a barely different form is found in Brittany, and on Mount Elbruz in north-east Persia. In a paper read before the British Association at Bristol in 1875, Dr. Phené accounts for the presence of *Pirus cordata* in Western Europe by the fact of the country having once been inhabited by a race of people having strong Oriental characteristics.

Septate and Continuous Mycelial Tubes of *Peronospora infestans*.—In the controversy respecting the nature of the bodies discovered by Mr. Worthington Smith, and believed by him to be the oospores of *Peronospora infestans*, it was objected by some that the mycelium as drawn by him was not that of *Peronospora* at all. Now, Mr. C. B. Plowright figures in the *Gardener's Chronicle* for August 19 a portion of mycelium of this fungus, in which some of the branches are septate, while others are continuous tubes. The non-septate tubes contain abundance of granular protoplasm; and it is in these tubes, according to Mr. Plowright's observations, that the oospores are generated. In the same place Mr. Plowright represents oospores within the coils of a spiral vessel. It is gratifying to find that no undue importance was attached to Mr. Smith's discoveries, and it would be a graceful act on the part of the Royal Agricultural Society, who employed a foreign mycologist to investigate the potato disease, to bestow some reward upon this gentleman for his untiring and valuable labours in the same direction.

Temperature of the Air and Soil in Relation to the Growth of Plants.—Signor Cantoni, the director of the Agricultural Institute of Milan, has long been engaged upon a series of meteorological observations, more particularly with the object of ascertaining the influences of the differences in temperature of the soil and air on vegetation. An abstract of the results obtained is given in a recent number of the *Annales Agronomiques*. The commencement of growth in spring, its continuation and arrest, depend upon physico-chemical causes connected with the temperature of the soil and of the air considered both abstractedly and in relation to each other. But growth of the herbaceous portions of a plant, at least according to Cantoni's conclusions, is actually favoured by a soil whose temperature is several degrees below that of the air. Growth takes place, he asserts, when the difference in the temperature of the soil and air equals or exceeds 3° Cent. A smaller difference is required for the formation of starch, and particularly of sugary matters. Signor Cantoni thinks that by careful observations of this character we may hope to understand why plants in the same climate, in the same soil, and subjected to the same general conditions, do not begin and cease to grow simultaneously; why one plant absorbs more carbonic acid than another; why the same plant sometimes absorbs more, sometimes less of the gas, and why, when absorbing the same quantity of the gas, it varies in vigour; why growth ceases in autumn though the air is notably warmer than in spring, when growth commences; and a number of other problems of plant-life.

Sources of the Nitrogen of Plants.—The growth and nutrition of plants is a subject occupying at

the present time the attention of many biologists, and therefore it may not be inopportune to call attention to the apparatus for determining the sources of the nitrogen of plants, exhibited by Mr. Lawes in the biological section of the Loan Collection at South Kensington. We should explain, however, that this apparatus was designed rather to ascertain whether plants are able to assimilate the free nitrogen of the atmosphere than to determine the actual sources of their nitrogen. It is not our intention to describe this apparatus in detail, nor to enter fully into the results of the experiments, which were conducted nearly twenty years ago. It may be stated that the results of these experiments—which are fully set forth in the *Philosophical Transactions*, part ii., 1861—are still accepted as decisive as regards the non-assimilation of uncombined nitrogen by plants. The greater part of the apparatus is a contrivance for washing and conducting the air to the isolated plants free of ammonia. By pressure of water the air was forced through sulphuric acid and a saturated solution of ignited carbonate of soda before reaching the medium in which the plant was growing. The plants were all raised from seed in this isolated medium, in a soil previously deprived of all its combined nitrogen. Controlling experiments were conducted simultaneously, and they fully confirmed the view that free nitrogen is not assimilated by plants. When deprived of combined nitrogen, the seeds in most cases germinated and grew, but only developed as miserable plants, which formed no traces of seed in the most vigorous; and the actual gain, in any instance, of nitrogen, beyond that contained in the seeds, in the whole plant, subsequently analysed, was so infinitesimally small that it might be due to error in the analysis. In most cases there was a slight loss. Against this, plants supplied with a known quantity of combined nitrogen were as healthily developed as could be expected under the artificial conditions necessary for the experiment; but these did not, as was thought possible with their greater vigour, assimilate any free nitrogen.

Ergotised Grasses.—Mr. A. S. Wilson has been making some observations and experiments on ergot, which are published in the *Transactions* of the Botanical Society of Edinburgh, and reprinted in a pamphlet form. In the district (Aberdeen- and Kincardine-shires) where his investigations were carried out, Mr. Wilson rarely found ergotised rye, though he sought for it year after year. Indeed, ergotised barley was almost as frequent as ergotised rye. The question arises, how did ergot become specially associated with rye? Was ergot formerly more prevalent on rye, or is it still in other localities? If so, there must have been some change in the conditions, though it is difficult to say what. It is a noteworthy fact that ergot has spread, within the last two or three years, to an alarming extent in some parts of New Zealand. The grasses most subject to ergot in the district named are: *Glyceria fluitans*, *Lolium perenne*, *Phleum pratense*, *Holcus mollis*, and *Anthoxanthum odoratum*. Less frequently: *Triticum sativum*, *T. repens*, *Secale cereale*, *Hordeum distichum*, *Nardus stricta*, *Alopecurus pratensis*, *Phalaris arundinacea*, *Aira caespitosa*, *A. flexuosa*, *Holcus lanatus*, *Arrhenatherum avenaceum*, *Poa pratensis*, *P. annua*, *Dactylis glomerata*, *Festuca elatior*, *F. pratensis*, and *Lolium temulentum*. It is a singular fact that none of the species of *Bromus* are ever ergotised, nor are oats. With respect to the number of species of ergot fungus, Mr. Wilson is of opinion that there is only one. Accompanying the text is a collotype plate representing twelve different ergotised grasses, but on too small a scale to be of any use.

The Influence of Temperature on the Movement of Protoplasm.—In the *Flora* for April and May Dr. Velten describes and illustrates some researches he has been conducting on the influence of temperature on the movement of the protoplasm in

Nitella syncarpa, *Elodea canadensis*, *Chara foetida*, and *Vallisneria spiralis*. He also describes the apparatus employed to control and register different degrees of temperature. Taking *Elodea canadensis* first, the granules of chlorophyll were motionless, or nearly so, at the freezing point; and isolated granules traversed a tenth of a millimetre in 50 seconds, at a temperature of 34°·25 Fahr., in 29 seconds at 36°·5, in 21·7 seconds at 41°, in 13·1 seconds at 50°, in 9·3 seconds at 68°, in 5·3 seconds at 97°·25, and at 104° they were again motionless. In *Vallisneria spiralis*, the increase of velocity for temperature was much more regular, especially above 36°·5. At 34°·25, 45 seconds were consumed in travelling the same distance, whereas at 35°·5 the time was only 27 seconds. With increasing temperature there was a gradual decrease in the time required up to 101°·75 Fahr., at which temperature the time occupied in traversing the tenth of a millimetre was only 2·3 seconds. Above the last temperature named the movement gradually became slower, and ceased altogether at 113°. In *Chara foetida* the rate was much greater for temperature, and the maximum rate of movement much greater. Thus, at 34°·25, 20 seconds; at 36°·5, 7 seconds; and at 93°·9 the time occupied was only 1·06 seconds.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY.—(Wednesday, August 2.)

SIR SIDNEY SMITH SAUNDERS, C.M.G., Vice-President, in the Chair. Mr. Stevens exhibited *Tillus unifasciatus* and *Xylotrogus brunneus* taken on an oak fence at Upper Norwood; and Mr. Champion exhibited *Harpalus 4-punctatus*, *Dendrophagus crenatus*, and other rare Coleoptera from Aviemore, Inverness-shire.—Mr. Forbes exhibited a specimen of *Quedius dilatatus* taken by him at sugar in the New Forest.—From a despatch from H.M. Chargé d'Affaires at Madrid, a copy of which was forwarded to the Secretary through the Foreign Office, it appeared that the damage done this year by the locusts was considerably less than that of last year, owing to the number of soldiers which the Government had been able to employ since the war was over, to assist the inhabitants of the districts where the plague existed in destroying the insects. Specimens of the locust as well as a number of earthen tubes containing the eggs were forwarded to the Society, and on examination they were found to be the *Locusta albifrons*, Fab. (*Decticus albifrons*, Savigny).—Mr. McLachlan exhibited a series of thirteen examples of a dragon-fly (*Diplax meridionalis*, Selys) recently taken by him in the Alpes Dauphinés, remarkable for the extent to which they were infested by the red parasite described by De Geer as *Acarus libellulae*. They were firmly fixed on the nervures at the base of the wing, almost invariably on the underside, and being arranged nearly symmetrically had a very pretty appearance, the wings looking as if they were spotted with blood-red. He considered that the Acari must have attained their position by climbing up the legs of the dragon-fly when at rest.—Mr. F. Smith read a note on *Nematus gallicola*, Steph., the gall-maker, so common on the leaves of species of *Salix*, but of which the male had, apparently, not previously been observed. From 500 or 600 galls collected by him in 1875 he had obtained a multitude of females, but only two males, and a similar experiment in 1876 resulted in a single male; and he thought that by perseverance in this way it would be possible to obtain the males of this and other allied species, of which the males were practically unknown, the female being capable of continuing the species without immediate male influence; and he argued from this that the long-sought males of *Cynips* might some day be found by collecting the galls early in the year. He expressed his belief that Mr. Walsh had proved beyond question the breeding of a male *Cynips* in America, although the precise generic rank of the supposed *Cynips* was disputed by some of the members present.—The President (Professor Westwood) who was unable to be at the meeting, forwarded some "Notes of the Habits of a Lepidopterous Insect, parasitic on *Fulgora candelaria*, by J. C. Bowring," with a description of the species, and drawings of the insect in its different stages, by himself. It appeared that the cocoon-like larvae were found attached to the

dorsal surface of the *Fulgora*, feeding upon the waxy secretion of the latter, and covering the insect itself with a cottony substance. From its general appearance the Professor was disposed to place it among the *Arctiidae*. This extraordinary insect was discovered many years ago by Mr. Bowring, and he (Mr. Westwood) had noticed it at the meeting of the British Association at Oxford in 1860, under the name of *Epipyrops anomala*.—The Rev. R. P. Murray forwarded a paper by Mr. W. H. Miskin, of Brisbane, containing "Descriptions of New Species of Australian Diurnal Lepidoptera in his own collection."—Mr. Edward Saunders communicated the third and concluding portion of his Synopsis of British Hemiptera-Heteroptera.

FINE ART.

The Archaeology of Rome. By John Henry Parker, C.B. Volume II. The Forum Romanum and the Via Sacra. (Oxford: James Parker; London: John Murray, 1876.)

THE progress of discovery in Rome has been so rapid of late, owing to the extensive excavations in the Forum and elsewhere, that Mr. Parker has thought it expedient to change his plan of publication and complete this part of his work at once. He has arranged his materials in the form of a walk from north to south, from the Capitol to the steps leading up to the Via Sacra on the south. He might have reminded us that Virgil had adopted a similar method of illustrating the topography of Rome, when he makes Evander walk with Aeneas up the valley between the hills, and describe the objects on either hand. In the Preface to the second part (on the Via Sacra) our author gives an interesting account of the origin and extent of his own researches. England may claim no small share in these discoveries. The great excavations in the Forum were begun about 1812 by the Duchess of Devonshire, then resident in Rome, who excavated all the space between the Tabularium and the modern road. Louis Napoleon bought the Farnese Gardens, which happen to consist of the exact site of the earliest fortress, the old *Roma Quadrata*, but at first he only excavated in search of statues for the museums at Paris; and it was only after the example had been given by the British Archaeological Society of Rome, of making excavations for historical objects only, that the Emperor decided on continuing the excavations on the Palatine for such objects also. It is very instructive to compare Mr. Parker's view of the Forum in 1650 at the time of the Jubilee (plate 1), with the view in 1874 (plate 2):—

"The central arch of the great triumphal building of Septimius Severus is filled up to half its height, and the side arches almost to the top. The three columns of the Temple of Saturn (given separately in plates 6 and 7) have only one-third of their height above ground. The column of Phocas, and the celebrated three columns of the Dioscuri, have no bases visible. Of the Basilica Julia not a vestige can be seen. The Palatine is a spruce garden, with no ruins at all visible."

The excellent illustrations from photographs give us means of checking Mr. Parker's statements throughout, and he has added to them a complete copy of the Monumentum Ancyranum with Mommsen's explanations and supplements, and of the old Marble Plan of Rome, which was thrown down and broken by the earthquake that over-

threw the Basilica of Constantine. One of the fragments of the Marble Plan gives a view of the Porticus Liviae, to which Mr. Parker has devoted special attention. There are also plates of the coins or medals which represent buildings and sculptures in the Forum. The excavations have shown that the Forum is much smaller than was expected, and the Basilica Julia extends down the whole length on the western side. The churches of the Ara Coeli, &c., of course obtain due attention, and here Mr. Parker's earlier studies naturally come in.

"In both these cloisters the peculiarly ugly Roman buttress is used, consisting of a straight slope, without any break or set-off. This buttress is universally copied in the cloisters of the friaries, commonly misnamed Abbies, in Ireland. As Rome was always at least a century behind England and France in each change of the Mediaeval styles, so we find the same in Ireland. The architecture of the friary churches and convents of the fifteenth century in Ireland, as in Rome, is often a bad imitation of that of England in the twelfth or thirteenth, as in this cloister of the fourteenth century at Ara Coeli. It was only in the Renaissance, or revival of the Pagan style, that Rome was in advance of the Western nations."

Mr. Parker rightly lays stress on the use of photographs and photo-engravings in preference to drawings. No artist ever thinks of showing the thickness of the mortar between the joints of the stones, or the thickness of the bricks; yet on these two points the date of a building often depends, at the most important turning-points in the history of architecture. Any of Mr. Parker's extensive series of photographs can be had for a shilling, and they are invaluable as illustrating many objects that are now buried again or entirely destroyed. We have had much pleasure in following the course of discovery in this volume, though here controversy is still actively at work, and Mr. Parker has to fight hard on several points to hold his ground. We would just notice that when he says, "this door (plate 8) opened at the foot of the steep flight of stone steps believed to be mentioned by Cicero as the steps of the Aerarium, and the mounting of which is jocularly compared by him to climbing the Alps," he is laying too much stress on the passage of Cicero "pro Fonteio." Fonteius, the praetor of Gaul, was accused of appropriating public money, but there was no proof against him in the Treasury accounts, and Cicero says, "quae est ista accusatio quae facilius possit Alpes quam paucos aerarii gradus ascendere?" The fewer and shorter and easier the steps of the Treasury, the stronger would be Cicero's antithesis. The passage really proves nothing about the Treasury either way. We trust soon to see the next part of the *Archaeology of Rome*, and wish Mr. Parker all health and strength to complete his work.

C. W. BOASE.

Nachrichten von Künstlern und Werkleuten Nürnbergs. Von Johann Neudörfer, 1547. (Wien: Braumüller, 1875.)

THE quaint little old German volume, with solid binding and yellow pages, that students of German art now and then come across in libraries under the title of Neudörfer's *Nachrichten von der vornehmsten Künstlern*

und Werkleuten so innerhalb hundert Jahren in Nürnberg gelebt haben, has lately been republished in modern form (that is, in paper cover, and Roman characters), as the tenth volume of Ettelberger von Edelberg's valuable series of *Quellenschriften für Kunstgeschichte*. Neudörfer's original manuscript, written, as the dedication to Georg Röhrer informs us, in the space of eight days, and finished on October 16, 1547, is unfortunately no longer in existence, but several copies of it differing slightly from one another have been preserved. Heller printed a portion of one in 1822, and the above-mentioned little volume was printed in 1828 by Dr. Friedrich Campe, from a manuscript in his own collection that he evidently thought was original, but which was most probably only one of the copies. The present edition is not taken from the Campe text, but from a manuscript of the sixteenth, or beginning of the seventeenth, century, preserved in the town library of Nürnberg. It has been carefully examined and compared with others by Dr. G. W. K. Lochner, keeper of the Archives of Nürnberg, and is enriched with numerous elucidatory notes.

Johann Neudörfer, who may be termed the Vasari of Nürnberg, was born in 1497, and exercised the profession of writing and arithmetic master in his native town in the first half of the sixteenth century. He was best known to his contemporaries as the inventor of a highly ornamental style of German handwriting, and had a large number of pupils and imitators. It is not, however, for his system of caligraphy that he is now remembered, but as being the founder of the art-history of Nürnberg, for no one before his time seems to have thought the artistic annals of that art-loving old town worth recording.

His biographies or "accounts" (*Nachrichten*) of the artists and artisans who were his fellow citizens are far shorter than those of his famous Aretime contemporary; and having been written simply for his own satisfaction, and that of his friend Georg Röhrer, to whom they are dedicated, without any idea of publication, they naturally have not the same literary merit. Nor are they distinguished by any critical knowledge of art. He expressly disclaims being learned in art matters ("der ich mich doch gar für keinen Kunstverständigen weiss"), but:—

"seeing that our Herr Gott," he writes, "has gifted this praiseworthy town before others with artists and art-workers, I have deemed it well during these eight days in which I have been spared night-time by my pupils, to prepare a short list of those whom I have seen, known, and with whom I have oftentimes had dealings, but with no other intention than that it should remain between us two [Röhrer and himself], and that on some holiday when we are sitting together, we may talk over it, and put each other in mind of many other particulars."

Whether these other particulars were ever added we know not. Probably not, or they might have corrected some of the numerous mistakes that appear in these biographies, which, although written for the most part about contemporaries and with every source of information available, are by no means free from inaccuracies and misstatements of date and fact. But, in spite of errors of this

kind that might easily glide into such an unpremeditated composition, the value of these contemporary records of the art-life of Nürnberg in the fifteenth and sixteenth centuries can scarcely be overrated, for they help us to form a more vivid picture of the quaint mediaeval town with its pious masons, coppersmiths, braziers, wood-engravers, potters, goldsmiths, architects, sculptors, and painters, than we could gain from any amount of study of dry documents and dusty archives. They form, indeed, a curious example of "How it strikes a contemporary," for in these naïve accounts the same importance is given to simple, honest workmen whose labours are now utterly forgotten as to the great artists of Nürnberg whose names have become world-famous. Thus we are told the history of the God-fearing Hanns Behaim the elder, and of his nephew and son, stonemasons on the Pennz; of Röhren Cunz, celebrated for his water-conduits; of Sebastian Lindenast, coppersmith, who wrought copper vessels "as though they were of gold or silver," and who was "graciously privileged by the Emperor Maximilian to gild his works;" of Caspar Wernher, locksmith and clockmaker, who made a wonderful ship with figures in it that moved about on the table, and who "exercised himself so much in the art of watchmaking that he lost his reason," but "was restored through medicines and God's grace;" of Georg Weber, carpenter, who, although he could neither read nor write, was excellent in mill-work, and understood proportion; of Hanns Glim and Ludwig Krug, goldsmiths; Georg and Nicolaus Glockendon, illuminists; of the family of Hirschvogel, glass-painters, one of whom, travelling in Italy, learnt the Majorca secret of enamelling pottery, and, bringing it back to Nürnberg, established the first Majolica manufactory in Germany; of Hanns Ehemann, spectacle-maker, Wolf Traut, painter, Simon with the lame hand, sculptor, Bernhard Müller, silk-embroiderer, and many other notabilities of their time and town, whose names for the most part now only survive in Neudörfer's pages. On the other hand, men of whom not Nürnberg only, but all Germany is justly proud, artists whose fame will live for centuries yet to come, often receive but slight notice. To Albrecht Dürer, certainly, Neudörfer accords a somewhat longer biography than is his wont, but his account of him is inaccurate in many particulars. The value then attached to Dürer's engravings is curiously revealed by the statement that "whoever might wish to purchase all his engraved art (*alle seine gerissene und gestochene Kunst*) could not do it under a matter of nine florins." Concerning Adam Kraft, also, we are told a few interesting details, as, for instance, that he worked with his left hand just as well as with his right, and that he always employed a strong ignorant country lad as his journeyman: but the celebrated Peter Vischer the elder, who with his five sons worked for twelve years on the noble shrine of St. Sebald, finishing it at last "to the glory of God alone, and to the honour of St. Sebald, Prince of Heaven, in 1519," has a very bare and short notice bestowed upon him, in which his great work is not even mentioned. The history of Veit

Stoss, the famous wood-carver, is likewise very insufficient. Baader in his *Beiträge zur Kunstgeschichte Nürnberg* has made known many particulars about this "unquiet burgher," who it appears was ordered by a "merciful Rath" to be publicly branded on both cheeks with a hot iron as a forger, so that the sentimental interest that is attached to the poor blind old artist is somewhat misplaced. Neudörfer tells nothing of this story, perhaps out of consideration for his erring fellow-townsmen. Of Antonius Koburger, the celebrated printer of Nürnberg and god-father to Albrecht Dürer, we are told that he had twenty-four presses working daily, giving employment to more than a hundred workmen (a large number in those days), all of whom went to their work at a certain hour, none of them being allowed to enter the premises alone. Of the goldsmiths Wenzel and Albrecht Jamnitzer, whose works are still held in the highest esteem, Neudörfer is "afraid to say too much because they are his dear friends," but the best piece they have executed, he considers, is bringing their father and mother from Vienna to be under their care and support. He seems to think some apology necessary for introducing Hanns Sachs, the shoemaker, among the worthies of his town, but he recognises him, nevertheless, as "a true German poet, well read and practised in Holy Writ." Hanns Sebald, and Barthel Beham, Georg Penz, Hans Springinklee, Dürer's pupils, and other Nürnberg masters, among whom we find Jacob Walch, make up the number of biographies, seventy-nine in all, which the industrious writing-master spent a week in compiling. These were afterwards added to by Andreas Gulden, who wrote a continuation of Neudörfer's *Nachrichten* in the seventeenth century, including a notice of Neudörfer himself; but this continuation is not nearly so interesting as the earlier work.

The value of the present edition is immensely increased by Dr. Lochner's copious analytical notes, which contain the carefully-sifted results of all the latest researches into the art-history of Nürnberg. The notes to the biography of Veit Stoss, for instance, occupy thirty pages, while the biography itself is only half a page in length. Dr. Lochner is, of course, well fitted by his official position to undertake such a task, and has evidently spared no trouble in its performance.

Neudörfer's *Nachrichten*, in their revised modern garb, now form an excellent companion volume to Dr. Thausing's edition of Dürer's letters, journal, &c., published a short time ago in the same series.

MARY M. HEATON.

NOTES AND NEWS.

THE very laborious and delicate task of hanging the pictures in the enlarged National Gallery has been so accomplished as to elicit general approbation. Nothing, however, is perfect to the degree of being unimprovable; and we will specify two points (by no means implying that these are the only two) open, in our judgment, to considerable improvement. (1) A large number of the Turners are hung so high as to be simply invisible to a man of ordinary long sight without spectacles, or to a slightly short-sighted man *with* spectacles;

also, another not small number of Turner's oil-paintings are not hung at all. They figure in the catalogue, not on the walls. (2) The hanging of Haydon's *Lazarus* on a dimly-lighted staircase is a cruelty to the memory and reputation of a great-spirited painter, and a real discredit to the country. It looks as if the very name of High Art were detestable to us: one large picture of that class must go to a staircase, while dozens on dozens of Low Art British pictures, of moderate dimensions, and of no intellectual and next to no executive deservings, jostle one another in the galleries. It happens, too, that Haydon's picture is peculiarly ill-treated, for, according to the position of the staircase, one cannot anywhere get a tolerable view of the supremely fine thing in the work, the head of Lazarus. This painting—in some respects the most important production of the British School that the National Gallery contains—is relegated to the immediate and exclusive company of Cruikshank's *Worship of Bacchus*, an example of pictorial eccentricity which, though assuredly not inferior on certain grounds to various paintings upstairs, must, nevertheless, expect to be placed in an exceptional, and to some extent invidious, position.

We have received from Mr. Samuel Tinsley, the publisher, a large pamphlet or small volume bearing the title of *Art in the Nineteenth Century, with Illustrations from the Royal Academy Exhibition of 1876*. As a justification for its appearance at the end of the season, its author claims for it some value as an independent though "unpretending essay on the subject of Art generally," but when we come to look through it, it is little more than a bald chronicle of the contents of the various rooms in the exhibition of the Royal Academy. There is no general grasp of the tendencies of modern art, and no worthy elucidation of the work of a particular master. One of these things we hold a book must have, if it claims to concern itself with modern art in any larger way than that of the art-reporter with his cataloguing and commentary. The author of this book would be justified in not deeming it flattering did we tell him that his collected comments take rank with those of the reporter. But we cannot even tell him this. Reports, published at the proper time, are not without a certain fulness. We see little in the production before us, though the author undoubtedly has views of his own, and sets them forth with boldness. Nor does he always go wrong, for he condemns the Pre-Raphaelites, and admires Lady Dudley. He even says so in a poem.

SOME of the Norwich admirers and students of the great local landscape-painter, Cotman, have been accustomed to doubt the accuracy of the statement of the Messrs. Redgrave that Cotman died in 1842. They have believed him to have died in 1843, the year in which the prints forming his collection were sold at Christie's Auction Rooms. The matter has now been set at rest. The Redgraves' *Dictionary* does not mention the place of his interment, but recent inspection of the parish books of the parish church of Marylebone shows him to have died indeed in 1842, and to have been buried in the St. John's Wood Cemetery—the graveyard behind St. John's Wood Chapel, which was then almost in the country. The entry in the register at the mother church of Marylebone is to the effect that John Sell Cotman, of Hunter Street, Brunswick Square, was buried by the Rev. Thomas Wharton, M.A., on July 30, 1842, aged sixty years. The sale of his prints—the date of which, together with some circumstances only known locally, has misled his Norwich students—seems, on inspection of the priced catalogue at Messrs. Christie's, to have been an unimportant affair. The sale included none of his own etchings, either of Norfolk or Normandy. It comprised one hundred and forty lots, often many prints in a lot, but the whole went for less than thirty pounds—hardly a fruitful day's work for the eminent auctioneers of art.

By the death of Mr. John Frederick Lewis, R.A., contemporary art loses one of its most respected and competent professors. His loss to the body of which he was an honoured member was already in some sense anticipated, for, although Mr. Lewis was represented in the last exhibition at Burlington House, he had retired from the list of acting Academicians some weeks before his death, and his place was already filled by election. He was a prominent example of a considerable body of English artists of the present time, who have risen to distinction without the help or patronage of the Royal Academy. Although well advanced in years, he was comparatively young in Academic rank, having been elected Associate so recently as 1859, and not attaining to full honours until several years later. But long before his talent had been recognised by the National Institution it was well known to, and appreciated by, the art public, and so early as the year 1855 he had been elected President of the Society of Painters in Water-Colours. It is, perhaps, by the skill of his practice in water-colour that Mr. Lewis will be best remembered, and the technical mastery which he developed in this branch of his art is generally characteristic of the nature of his talent. His fame, indeed, rests less upon any intellectual force of invention than upon a highly-trained executive power very rare among English artists, and still more rarely combined, as in his case, with a close and courageous dependence upon nature. The twofold possession of manipulative skill and keen observation gave always a distinct interest to his work even when it was least supported by higher qualities of invention; and this interest, as might be expected, attached more particularly to his experiments in regard to colour, where the results were nearly always remarkable, if not always beautiful. As bearing upon the question of Mr. Lewis's technical proficiency, it is not unprofitable to observe the course of his early studies. The son of an engraver, he began his own career with the study of engraving; and perhaps no work from his hand is better deserving of attention than the series of etched studies of animal life published when the artist was only twenty years old. These plates are highly remarkable, not merely for their fidelity in the rendering of brute character, but still more as refined and powerful essays in a branch of art that has since been successfully revived. From them we may learn that Lewis, before his entry on the practice of a painter, was already a skilled draughtsman, learned in the laws of light and shade. These etchings, with their careful selection of line and their refined feeling for inanimate nature, create an impression of the artist's powers which is scarcely sustained by the next publication upon which he ventured, consisting of a series of lithograph drawings illustrating the manners and costume of Spain. This volume was published in 1834, and three years later the artist again betook himself to travel, remaining out of England for a period of thirteen years. During this time he visited Italy, Greece, Turkey, and Egypt, and, returning in 1851, exhibited in the following year the water-colour entitled *The Harem*, succeeded by numerous other drawings of Oriental and Southern life. In recent years his exhibited works have been numerous, and have been chiefly devoted to the interpretation of Eastern scenes. Of all details of architecture and costume he has ever been a careful and laborious student, and he has interpreted with the utmost skill and minuteness the brilliant effects of light and colour which the chosen material of his art has offered him.

THE ancient church of S. Francisco at Urbino was re-opened last March. Researches into its history have lately been made by Prof. Borghononi, and an old Gothic chapel beneath the campanile has been carefully restored. On the walls of this chapel, underneath numerous coats of whitewash, a fine fresco has been found representing Christ disputing with the doctors, and figures of SS.

Peter, Paul, and Catherine. Traces of coloured ornamentation have also been found on the outside walls.

IN the *Portfolio* this month Mr. P. G. Hamerton, continuing his Life of Turner, defines the period of what he describes as Turner's "complete deliverance from topography and his artistic independence of the fact" as beginning with his picture of *Kilchurn* exhibited in 1802. Turner's *Kilchurn Castle* is certainly as unlike the real *Kilchurn*, as given in the sketch by Mr. Hamerton, as it can well be, and, strange to say, the real is far more picturesque than Turner's version or "dream" of it. For instance, in the real there is a keep, and towers and turrets with a grand mass of ivy growing on the side of the ruins towards the lake. All this Turner has completely ignored, and has given instead a massive Norman fortress of severe aspect. It is the same with the mountains and the lake. They both show that even at this early period he regarded not mere accuracy and local truth of character, but had entered already into "that enchanted land that belonged to him and to him only." In "Technical Notes" Mr. H. W. B. Davis, A.R.A., gives some further advice on the construction of pictures that is likely to be extremely interesting and useful to young artists. Mr. Dobson's method is also described.

THE organisation of the Art and Industrial Exhibition at Munich does not appear to have been very efficient. The official catalogue, for instance, was not ready until nearly a month after the opening of the exhibition, and even then it was found to be very defective, for, although the title-page mentions "old and modern German masters," it is really only the modern schools that are included in it. Other important omissions also occur which it is difficult to excuse, considering the long delay in its publication. According to the numbers given, 494 German painters, 129 sculptors, and 101 architects have contributed—not by any means a large number, considering the important character of the exhibition and the claims it put forth to more than ordinary excellence. It certainly promised well, but from all we can hear its achievement has fallen far below its aspirations.

THE first Grand Prix de Rome for painting has been awarded to M. Wincker, and the second to M. Dagnau, both pupils of Gérôme. In sculpture MM. Lanson and Boucher have gained the two prizes.

COUNT FRANZ POCCHI, a distinguished poet, musician, and artist who, under three monarchs, held high office at the Court of Bavaria, died a short time ago at Munich. Pocchi is chiefly known in England as the author and illustrator of a number of charming tales and verses for children, but in Germany his musical talent was almost as much appreciated as his poetic and artistic powers. He was the composer of an opera and many popular melodies, and delighted in setting to music and illustrating old national songs. His dragons, giants, dwarfs, elves, and other creatures of Wonderland, are especially delightful, and really form what he entitles one of his books, a "Lustige Gesellschaft." Pocchi has published two or three dramas, and in 1851 edited a translation of Joubert's works, but in general he eschewed all tedious and important undertakings, and devoted the leisure that his position at Court afforded him to the cultivation and enjoyment of his threefold talent for literature, art, and music. Raczyński says of him, in his *History of Art*, "that in some respects he was allied to Neureuther and Schwind, but that his art was entirely original, and received no bias from their influence." He was sixty-nine years of age at the time of his death.

THE STAGE.

"BLEAK HOUSE" UPON THE STAGE.

ON Saturday we witnessed at the Globe another version of *Bleak House*: different from that of Mr. Burnett, chiefly by reason of its being more obscure. Somehow Mr. Burnett, in the version made popular by Miss Jennie Lee, did manage to unfold a more or less connected story. It was not absolutely necessary to have every chapter of *Bleak House* at one's fingers' ends as one saw it. With Mr. Lander's it is—if one desires to have anything like a fair appreciation of the significance of the characters and of their relation each to the other. Otherwise the piece is a mere collection of scenes sensational or comic, some of which tell on a London gallery in virtue of their exaggeration and of the complete incapacity of the playgoer to understand the difference between a drama and an "entertainment." This version of *Bleak House* is without unity or sequence; and if a playgoer of average intelligence can listen to and watch a part of it without entire distaste, that is chiefly because of the great writer's qualities, which it has not been possible wholly to banish from any version of the work.

We do not at all share the opinion of an influential contemporary that *Bleak House*, though a great novel, must necessarily make a bad play. It has made a popular play already, through the realistic pathos of the author in "Jo," well interpreted by the lady whose name is associated with that success. Thoroughly effective comic elements are to be found in the relations of the law-stationer with his wife and with Chadband. These, though fairly brought out in the last version, have never had at the hands of the actors quite the treatment that they deserve. Then there is the group at Chesney Wold: Sir Leicester and Lady Dedlock and Mr. Tulkinghorn, who certainly have not fared better. The novelist's own conception of that group is a little forced. Exception may be taken to the immense and mysterious reserve maintained between husband and wife, and still greater exception to the calm yet bitter determination of the family lawyer to bring down Lady Dedlock from her high place, by the exposure of secrets with which he has nothing to do. But, whatever exception may be taken on the score of improbability, there is no question but that Dickens in this group did so marshal his figures as to impress the imagination of reader and audience. The reserved and proud man, to whom at last his disgrace is to be disclosed; the silent and stately woman, with her two lives of Past and Present; the haunting figure of the old lawyer, her enemy, secret in his arrivals, secret in his departures; and the prolonged hush in which these figures stand, while reader and audience hold their breath in waiting for the bursting of the social storm—all that is faulty, if you will, in one way or another, but it is dramatic and effective: it contains the elements of a great stage success, and to get a great stage success it requires only deliberate and patient treatment from skilled actors who believe in it. Till that is afforded it, in some version the adapter of which shall recognise in this Dedlock group the central and chief interest of the story, as Dickens did himself, it is premature to declare that *Bleak House* must make a poor drama.

It may be that the character of "Jo"—which thus far has been found the most successful—is in some respects the most dramatic in the novel. The high lights and shades are certainly his; but he is well-nigh isolated; he is at most an instrument; his is not the story which we chiefly care about: he can but do his share, and it is not a great one, in the development of that story. In the first satisfactory version of the novel, Jo would resume his natural proportions. He would again be little but an effective episode.

It is curious, nevertheless, to see how Dickens's own sympathy, and his knowledge to boot that he would have the public sympathy, led him to round

and to complete this character of "Jo;" while his immense, and at that time already almost instinctive, deference to the taste of the large middle-class, for which he chiefly wrote, led him to deprive this central character of Lady Dedlock of much that in bolder hands might have enriched it. The very little we are told about the man her lover, whose last days were spent as a law-writer in a garret by Chancery Lane, gives, of course, an air of interesting mystery to this part of the story. Our curiosity is stimulated, but not gratified. It is a part of Dickens's art no doubt that this should be. That is to say, having to be reticent he would make reticence effective. But there is hardly any other important novelist, except the novelist of what we call "Society," who would have shrunk, as Dickens did shrink, from tracing at least in a retrospect something of the course of a love which had, at all events, the interest of passion. There is hardly another great novelist who so persistently declined to treat passion; who shrank back when only on the verge of it. This purely middle-class avoidance of it—an avoidance now timid, now discreet—is one of the marks of Dickens's belonging by habit of mind to a generation more respectable than ours, or less outspoken.

As for the acting of the version of *Bleak House* which they play now at the Globe, little is to be said of it by way of praise. As a whole, it compares unfavourably with the meritorious but imperfect acting of the now better-known version in which Miss Lee has appeared. There are one or two exceptions. The young man of the name of Guppy finds now, perhaps, for the first time in Mr. George Skinner an adequate exponent of his well-meaning and unconscious impudence. He looks and bears himself so like to the intruder on Lady Dedlock's solitude that he could afford to discard the one or two exit-speeches with which he appears to have been provided on the assumption that Dickens's humour needed additions. Of course the effect of all his bearing is very much lost when he is set against a Lady Dedlock who has none of the pride and distance which belong to her in the novel. And at the Globe this is the case. Sir Leicester, too, is represented by an actor who gives no importance to the part, and Tulkinghorn's silence is without the authority of knowledge and accepted position. One character, that of Hortense, the revengeful maid, appears much overdone. In a moment, before the audience is at all aware that she has any serious cause of quarrel with Mr. Tulkinghorn, she bursts out into tones and gestures of melodrama necessitated only at the time by the conventions of the suburban stage. The unsuitableness and the inartistic surprise of this, as of the shadowiness of most of the other characters—those especially of the group of the Dedlocks—may be in part occasioned by the employment of actors who, to speak of them in measured terms, are not of the first order; but these various faults are mainly caused, we suspect, by the untimely discovery that Jo, the crossing-sweeper, could be so played as to be the leading *dramatis persona*. Miss Lee so played him. Her success is answerable for the effacing, now, of much that should have been retained and made effective. At present, at the Globe, the one part to which the rest are sacrificed is acted by a lady who does not seem to think of any other course than that of reproducing Miss Lee as far as possible. Her imitation is excellent, and may rank in merit with the frank burlesque of popular actors attempted lately at the Strand by Mr. Terry and Miss Claude, and often a strong point in the programme of Mr. Toole. As one watches the scene now at the Globe, with the patient, laborious, really quite clever reproduction of the last sensation of the London stage, one wonders when the song and "breakdown" will be coming, that the joke may reveal itself. But song and "breakdown" do not come; and it is all serious.

FREDERICK WEDMORE.

THIS evening at the Gaiety there is a change of programme. Mr. Byron's new comic piece, *A Bull by the Horns*, being the chief play of the evening. It will be followed by a new burlesque, *Little Don César de Bazan*.

THE season at Drury Lane will begin on September 23, when Mr. Barry Sullivan will appear in tragedy. The *Observer* announces the engagement at the same theatre of Mrs. Hermann Vezin, an actress of well-trying powers, and one not often seen on the London stage.

A Race for a Wife, the comediotta played at the Adelphi on Saturday before *Arrah-na-Pogue*, has little novelty in its theme, and no especial skill in its treatment.

MISS NEILSON has engagements for the early autumn in some of the large English provincial towns.

WHEN Mr. Buckstone returns to the Haymarket Theatre in October, he will probably appear in the *Rivals*, one of the pieces in which he impersonates a leading character with success. We may perhaps venture to hope that the Haymarket Theatre will not again court triumphs in melodrama or tragedy, which it has lately rather striven for than attained, and for which its associations and traditions little fit it.

MISS ADA CAVENDISH is going as usual upon a considerable autumn tour.

THE next occupant of the stage of the St. James's Theatre will probably be Mrs. John Wood, who only left it, it will be remembered, in June, to make way for the admirable interpreters of the *Danicheff*.

THE determination of the Duke of Meiningen, which we announced in our last, not to send his theatrical company to London next year, deprives London probably for an indefinite time of the chance of seeing any German acting either in the German national or the Shaksperian drama. We have been very desirous of seeing the Duke's company here, partly because it would in all likelihood have presented us with a perfection of *ensemble* such as only the Théâtre Français and exceptional performances at the Odéon and the Gymnase can attain. Of "stars" the Duke's company contains, it is allowed, but a scant supply; but the star system has fortunately taken less hold thus far of the French and German theatres than of the English. But if we are not next year to have the Duke's company, is there after all no capitalist or speculator, be he English or German, who will add for a while a German theatre to the attractions and advantages of the town? The commercial conditions under which an average German company, not important in numbers, but containing good actors, might come over here, would be entirely different from those of the singularly complete and numerous company of the Duke of Meiningen. The Duke of Meiningen or his business-manager would have to look for large receipts, which it is quite possible the frugality of the German population in London and the indifference of the wealthy English might combine to deprive him of. But putting large receipts and exceptional expenses quite aside—not looking at the German theatre at all for the moment as a novel attraction of the West End and of the London season—it must be remembered that there is in London the German population of a large German commercial city. Whatever Leipzig or Bremen or Augsburg can support in the way of a theatre may surely be supported by the German population of Islington and Barnsbury alone. It is very odd that this has not occurred to any shrewd speculator. We give him the benefit of the suggestion, and he in return may give us from an average company, not indeed acting so perfect as we have on some occasions seen from French and Italian celebrities and from our own, but at all events acting that would afford countless opportunities for interesting comparison.

At least four new pieces have been accepted at the Théâtre Français for the winter season. One of them is *Rome Vaincue*, a tragedy. Another is *L'Ami Fritz*, by MM. Erckmann-Chatrian. Then there is another tragedy; and, lastly, Emile Augier is engaged upon two pieces, one of which, if not both, will see the light during the coming season.

MUSIC.

THE BAYREUTH FESTIVAL.

It would have been quite practicable for me to send to the ACADEMY a week ago an account of the first, or even of the second, of the four performances which took place in the Wagner theatre. I, however, purposely refrained from doing so, for two reasons. The first, already referred to in my last letter, was that the work ought to be judged as a whole, and not merely from its first two parts; the second, and even a more important one, was that it was quite impossible under the strong musical excitement of the moment to form a really dispassionate opinion. Had I written immediately after leaving the theatre, I should very probably have said something which I might afterwards have wished to modify. I therefore resolved not to write a line till my return to London, so that after an interval of some days I might be able more clearly to record the impressions produced by what is unquestionably the greatest musical event of the present century.

It might perhaps have been expected that nearly a week after the performance the work would seem less impressive than at the time. The very reverse is the case. On my way to Bayreuth I passed through Cologne, and visited the Cathedral. When standing close to the porch, it is impossible not to be struck with the wonderful beauty of the building; but it is only on withdrawing to some distance that one can form an idea of the grandeur of the structure as a whole. Just so is it with Wagner's work. In the theatre itself the attention is arrested by the beauty, the power, or the dramatic appropriateness of the particular part of the music which is being performed; but it is not till afterwards that one is able to grasp the total idea, and to feel how colossal is the genius displayed in the entire conception and execution of this truly stupendous work.

Before entering into any details of the performances, it may be as well to give, as clearly and emphatically as possible, a judgment on the *Ring des Nibelungen* as a whole. I therefore take this opportunity of recording it as my deliberate conviction that it is by far the greatest work in the department of dramatic music that the world has ever seen. On expressing this opinion to a musical friend, I was met by the question, "Then, do you think Wagner a greater composer than Beethoven?" To this I replied, "Certainly not; but *otherwise* great." As a matter of fact Wagner's music is constructed, as I have attempted to show in a previous article, on so entirely different a plan from Beethoven's that the two belong to totally distinct regions of art; and comparison is no more possible between them than it would be between a sculpture and a painting. Nothing similar to the *Ring des Nibelungen* has ever been produced before; there are therefore no standards by which to measure it: it must be judged by itself, and by the effect it produces in performance; and I repeat in the most unqualified language that I consider it the grandest dramatic music that has ever been produced.

There has been considerable speculation as to what would be the effect of sinking the orchestra, so as to render it invisible. There could, of course, be no doubt that it would largely add to the illusion; but many fears were expressed that the acoustic results would not be satisfactory. These fears have proved groundless. Owing to the excellent construction of the theatre, the orchestra

seemed not only to lose none of its sonorousness, but positively to gain in richness. The brass instruments were wonderfully mellow in tone, and without a trace of that crashing coarseness which often proves annoying to musical ears; while in the most elaborate figures for the strings every note could be heard with the utmost distinctness. A curious point is that the wood sounded much more prominent than usual. Why this should have been so I am unable to say; but, as the result, the balance of the orchestra was different from that to which we are accustomed, and the whole effect was even richer than I had anticipated. The playing of the splendid band, under Herr Richter, was truly marvellous. Not merely were the most difficult passages executed with faultless precision, but for refinement, perfection of phrasing, "go" (if the colloquialism may be allowed, for want of a better word), and, above all, perfect conception of the composer's intentions, such a performance has probably never been heard. From the invisible orchestra poured forth a stream of gorgeous harmony, many of the tone-colours being absolutely new, which at times so riveted the attention as almost to make one forget what was passing on the stage.

Another excellent innovation introduced by Wagner with the view of increasing the illusion is the darkening of the theatre. Previous to the commencement of each act, a fanfare of brass instruments was heard from the orchestra, as a signal to the audience to take their seats. The whole of the gas-lights in the auditorium were then turned down, so that, excepting for the light from the stage, the theatre was in almost total darkness. It was impossible during the greater part of the performance to read a word of the text-book; happily, the pronunciation of most of the actors was so remarkably distinct that for those who were fairly well acquainted with the poem reference to the libretto was unnecessary.

The wonderful beauty of the scenery and of the whole *mise-en-scène* defies description. It was not so much the actual paintings, though these were of very remarkable excellence, having been painted by the brothers Brückner of Coburg, from designs by Josef Hoffmann, Court Painter at Vienna; as mere scenery equally fine views may have been occasionally seen at other theatres. But it may very safely be asserted that never before have any such effects been produced as the storms, the sunrises and sunsets, the gathering and dispersing of clouds, and similar atmospheric phenomena, as have been seen at Bayreuth. It was mentioned in these columns some weeks since that the stage is illuminated by more than 3,000 gas-burners. These are arranged and managed with such consummate skill as to produce at times an illusion which is absolutely perfect. As an instance of this may be mentioned the last act of *Die Walküre*. At the commencement the sky is cloudy and a heavy thunderstorm is raging; as the act proceeds the air clears, and a lovely calm summer sunset follows. The gradual lifting of the clouds and the changes of colour in the sky, the deep-red shading off in the most perfectly natural manner into the gray of twilight, till night falls, the last streak of red disappears, and then at Wotan's command flames spring forth on all sides and surround the sleeping Brünnhilde, were among the most magical effects ever seen on the stage. No less wonderful were the sunrise scenes in *Siegfried* and *Götterdämmerung*. At most theatres it is necessary to "make believe a great deal;" and when I read some time since in a German paper that at Bayreuth one seemed to see not a stage presentation but the actual thing itself, I set down the statement as the friendly exaggeration of an enthusiast. As a matter of fact, however, I found it in the large majority of cases the simple truth. Nothing can be conceived more absolutely natural than the "Nibelheim" scene in the *Rheingold*, the interior of Hunding's house, and the two mountain landscapes in *Die Walküre*, or the scene on the banks of the Rhine in front of Gunther's

palace in the second act of *Götterdämmerung*. No less remarkable was the disposition of the various groups on the stage, in those scenes where such appeared. Wagner is his own stage-manager. I had a long conversation with one of the chorus, who gave me many interesting details as to the minute attention which the composer pays to even the apparently least important points. The result of this extreme care is that in all the groupings, all the motions, even of the supers, nothing was to be seen at all conventional; everything was perfectly natural. Such an *ensemble* has probably never been obtained before.

Of the four parts of which the whole work consists, the *Rheingold* was not only the least interesting, but, as I had anticipated, the most fatiguing to listen to. When I say "the least interesting," I am only speaking relatively. In itself the music is remarkably fine; but Wagner, with rare skill, has made the entire series of works, so to speak, one long *crescendo*; each surpasses its predecessor. The fatigue arose from the necessity of sitting for two hours and a half listening to music requiring close attention in a heated theatre when the temperature in the open air averaged above 100° Fahr. in the shade. Hence, by the time the last, and finest, scene of this "Vorabend" was reached, I was so exhausted as to be quite unable to enjoy it as I most certainly should have done had I come to it fresh. None but a veritable musical "glutton" can take in so much music at once without a moment's breathing-time. In the *Rheingold* the gem of the performance was the Loge of Herr Vogl. His conception of the fiendish sarcasm of the fire-god was remarkable, and his enunciation of the text so distinct that one scarcely lost a word. At the close of his narrative in the second scene about "Weibes Wonne und Werth" an involuntary burst of applause, which was immediately suppressed, broke forth in the theatre. Hardly less fine was the Alberich of Herr Hill—perhaps the most difficult and thankless part of the whole work. Herr Betz, reputed the greatest German baritone, the possessor of a magnificent voice, and a most excellent style, sang the music of Wotan admirably; his acting struck me as almost too reserved; but probably it was his intention to present the god as extremely dignified, and not subject to ordinary human passions. To Herr Schlosser, whose Mime was a wonderful piece of character-acting, I shall refer again in speaking of *Siegfried*. The three Rhine-daughters were most excellent, as also were the giants Fasolt (Eilers), and Fafner (Reichenberg); while Frau Jaide, in the small part of Erda, deserves special mention for the declamatory power with which she delivered the few lines allotted to her.

One of the most remarkable points that struck me in the whole performance of the *Rheingold* was the truly wonderful tact which Wagner has shown in the distribution of his rôles. Every performer, without exception, had a part which exactly suited his voice and his style of acting; hence, to a large extent, the rare excellence of the *ensemble*. Another thing that should be mentioned is that, as I had expected, some of the most effective parts of the music were precisely those which would be the least interesting apart from the stage. This remark applies more especially to the third ("Nibelheim") scene.

In the *Walküre* both musical and dramatic interest is far greater than in the *Rheingold*. This is the portion of the work which could best be performed, and would most readily be appreciated, apart from the others. It is at present contemplated to produce it both at Berlin and Vienna. The heavenly beauty of the music, and the ideal perfection of the whole performance, produced such an effect as I never before experienced from any opera. Herr Niemann, the Siegmund, perhaps the greatest of German tenors, surpassed himself. He has been called "the Wagner singer *par excellence*;" and though he is no longer a young man, and his voice has lost somewhat of

its youthful freshness, he is still a most consummate artist. No finer acting than his in the whole of the first act can be imagined, and he was most admirably seconded by Frl. Schefzky as Sieglinde. No less impressive was he in the second act, especially in his great scene with Brünnhilde. As to the performance of the last-named part by Frau Materna, I might exhaust the whole vocabulary of superlatives without over-praising it. Frau Materna has a voice which in power and volume, as well as in quality, much resembles that of Mdlle. Titiens; and, in addition to this, she is indisputably one of the very greatest living tragic actresses. I shall not attempt to describe her impersonation, because no description would do it justice or convey the least idea of it to those who have not seen it. It was throughout perfection itself. The long dialogue in the second act between Brünnhilde and Wotan must, however, be specially named, because this is one of those portions of the music which are most difficult to appreciate apart from the stage, and which most imperatively require the highest order of acting and singing. When the *Walküre* was first produced at Munich in 1870, with only second-rate performers, this scene was found very wearisome; on the present occasion, when given by Frau Materna and Betz, it proved to be one of the most impressive parts of the music. The great scene of the mustering of the Walküren (act iii.) was most wonderfully rendered both by orchestra and soloists. Such splendid part-singing, such faultless perfection of intonation in music of extraordinary complexity and difficulty, and such a volume of tone from only eight voices, I never heard in my life. It was in this scene that almost the solitary instance of an unsuccessful stage-effect was noticeable. The ride of the Walküren through the air on horseback, represented by magic-lantern slides, was very unreal, and for the moment sadly destroyed the illusion. The final and most touching scene between Brünnhilde and Wotan, concluding with the farewell of the latter, is the crown of the whole work—a veritable triumph of musico-dramatic art. In this scene Betz was most magnificent, acting as well as singing with a power which his performance in the *Rheingold* had hardly led me to anticipate.

I was not much surprised on the following morning to see a notice posted about the town that owing to unforeseen circumstances the performance of *Siegfried* would be postponed to the following day; nor was this to be regretted, as the mental strain of listening night after night to such music was considerable. I learned that the reason of the postponement was the hoarseness of Betz, who after his exertions on the two first evenings needed a day's rest. The principal singers engaged in these performances must indeed have constitutions of cast-iron to enable them to support the fatigue. There are not to be found in dramatic music three more exacting parts than those of Brünnhilde, Siegfried, and Wotan; and only the greatest care on the part of the performers would enable them to hold out to the end of the third series.

The performance of *Siegfried*, which was given on the Wednesday, was in every respect worthy of those which had preceded. Herr Unger, who performed the title-part, looked the character to perfection. He is a magnificent specimen of a Teuton, standing, I was told, six feet five inches, and of well-proportioned figure. He has also a splendid and very powerful tenor voice, which, however, he used with so little reserve that by the end of the evening he was evidently somewhat "used-up." As an actor he is very fair, but by no means one of the best; still, all things considered, it would have been difficult for Wagner to find a better representative of the youthful hero. The great feature of the performance was the Mime of Herr Schlosser, one of the most highly finished cabinet-pictures that can be imagined. Always perfectly natural, highly comic, yet never

degenerating into farce, the impersonation was one which will never be forgotten by those who witnessed it. Especially striking was the scene in the second act in which Mime, in spite of himself, reveals his real intentions to Siegfried. Here the actor's task is of great difficulty, because his actions and his words must directly contradict one another. Herr Schlosser's delivery, in the most affectionate manner, of the words "Ich will dir Kind nur den Kopf abhau'n," was perfect, and excited a burst of laughter through the house. Among other noteworthy points of *Siegfried* must be named the scene of the forging of the sword Nothung, which forms the finale of the first act, which was most wonderfully put on the stage, and in which the intensely realistic music contributed not a little to heighten the general effect. Most exquisite, also, is the music of the "Waldesweben" in the second act, in which the voices of nature and the sounds of the forest are depicted in a manner worthy of Beethoven's "Pastoral" symphony, to which the music is akin in feeling, and equal in power, while free from the slightest tinge of plagiarism. The final scene of the awaking of Brünnhilde is again an inspiration of the highest genius. Here Frau Materna was unapproachable; and Herr Unger appeared to catch some of his companion's fire, and to act with more freedom and spirit than in the earlier part of the work.

In a previous article I have expressed an opinion that the *Götterdämmerung* is the finest of the four parts of which the *Ring des Nibelungen* consists. This opinion was fully confirmed by the performance. There is, however, one drawback to the perfect enjoyment of this drama; the first act, which, with the introduction, plays two hours, is decidedly too long. It is, as in the *Rheingold*, hardly possible to sustain the attention during such a period with music which makes so great demands upon the hearer. Hence, though the introductory scene with the three Norns (admirably sung and acted by Frau Johanna Wagner, Frl. Schefzky, and Frau Sadler-Grün) is most impressive, and the following farewell between Brünnhilde and Siegfried of wonderful beauty, we become wearied before the close of the act, and the powerful scene near the end between Brünnhilde and Waltraute failed to produce the effect which it should have done. In this work, again, every part was most adequately filled, the Gunther of Herr Gura, the Hagen of Herr Siehr, and the Gutrune of Frl. Weckerlin being equally worthy of praise. The second act is even finer than the first; but here the music mostly occupies a secondary position, and it is the dramatic situation which rivets the attention. Here Frau Materna was indescribably grand. Finer tragic acting than her's in the great scene where she recognises Siegfried and accuses him of perjury cannot be imagined. Nor should the truly astonishing chorus-singing of the "Mannen" in this act pass unnoticed. No such difficult operatic choruses exist as these; and they were sung with a precision and force which were really marvellous. The third act is not only the greatest portion of the work, but the greatest dramatic music that has ever been written. The whole scene with the Rhine-daughters, charmingly sung, in spite of its great difficulty, the death of Siegfried, and the following colossal funeral march, which is in no way inferior to the famous march in the "Eroica" symphony, produced an impression which is indescribable. It would have appeared impossible that this scene should ever be surpassed; yet this seeming miracle has actually been accomplished by Wagner in the finale of the work. Of Brünnhilde's last speech, of the wonderful combination of the music with the final *tableau*, previously described in these columns, the appearance in the sky of the burning Walhalla, with gods and heroes seated in solemn silence in the hall, I forbear to speak, simply because no words can give even a faint idea of the enormous effect produced. Again, however, I must refer to

the grand singing and acting of Frau Materna, who, in spite of her previous arduous exertions, seemed to show no trace of weariness, but sang to the last bar with a force and dramatic truth of expression which were unsurpassable. It was the universal opinion of those with whom I conversed at Bayreuth that it is in the highest degree improbable that any such renderings of the work as those now taking place will ever be witnessed again. It is very certain that nothing at all approaching them in perfection has ever been seen before. The highest anticipations I had previously formed as to the work and its rendering were certainly not only realised but very far exceeded.

It still remains to discuss the general question, Has Wagner in the *Ring des Nibelungen* justified his art-theories or not? and, if he has, how far, and in what way, is the work likely to exert an influence on the future of dramatic music? The former part of this question must, I think, be certainly answered in the affirmative. It is not necessary to go so far as to say that this is the *only* system on which a good opera can be written; what the composer has proved beyond a doubt is, that by the combination of all the arts upon an equal footing, a total effect can be produced which is unattainable in any other way. Take, for instance, the forging scene in *Siegfried*, or the last half of the second act of *Götterdämmerung*. In both these, the music would be, it is hardly too much to say, entirely ineffective in the concert-room; but in combination with magnificent poetry, fine acting, and a splendid *mise-en-scène*, it makes the greatest impression. In order to do so, however, it is useful that each factor shall be of equal excellence; and this is so rarely attainable that it may be doubted whether many composers will be tempted to imitate the form of the present work, at least to its full extent. A second-rate performance of the *Ring* would be unendurable—probably ludicrous. Nevertheless, the reforms which Wagner has introduced are too important not to exert a great, though chiefly indirect, influence on operatic music in the future. He has given greatly-increased weight to the dramatic, as distinguished from the purely musical; by doing away with all mere opportunities for display, he has aimed a death-blow at the tyranny of the vocalist, for which all true lovers of art cannot be too thankful to him; he has taught the singers that in self-sacrifice to their art lies their true greatness; and the greatest performers of Germany have, to their honour, shown us that they have learnt the lesson, and by abasing themselves have been the more highly exalted. It was most gratifying to see in the theatre a notice from the artists requesting that they might not be called before the curtain, as they wished to sink themselves in the work. Whether other composers will adopt Wagner's system of "Leitmotive" or employ his alliterative verse is a secondary question altogether; that the connexion between the music and the drama must hereafter be much closer than it has mostly been in the past can hardly be doubted. This will be one effect of the production of Wagner's great work; let us hope that the downfall of that accursed "star system" which is the bane of music in this country may also follow. With a few honourable exceptions, our singers think far more of themselves than of their art; would that they would follow the noble example set by those truly great artists who have contributed so largely to the success of the *Ring des Nibelungen*!

EBENEZER PROUT.

THE Birmingham Musical Festival commences next Tuesday, the 29th inst., and will be continued till Friday, September 1. The arrangements for the various concerts are as follows:—Tuesday morning, *Elijah*; Tuesday evening, F. H. Cowen's new cantata, *The Corsair*, and miscellaneous selec-

tion; Wednesday morning, Prof. Macfarren's new oratorio *The Resurrection*; Wednesday evening, Gade's new cantata, *Zion*, and miscellaneous selection; Thursday morning, *Messiah*; Thursday evening, miscellaneous concert (Gade's *Crusaders*, &c.); Friday morning, Spohr's *Last Judgment*, Wagner's *Holy Supper* ("Liebesmahl der Apostel") and Beethoven's Mass in C; Friday evening, *St. Paul*.

We regret to announce the sudden death of a distinguished amateur, Mdlle. Fanny Pelletan, of Paris, at the age of forty-six. Mdlle. Pelletan was engaged in the publication, at her own expense, of the magnificent new edition in score of Gluck's five great operas. Only the *Iphigénie en Aulide* and the *Iphigénie en Tauride* are as yet issued; but the *Alceste* is, we learn, just ready for publication. There appears some reason to hope that M. Camille Saint-Saëns will undertake to continue the edition, which is the only one at all trustworthy, or in any degree worthy of the music; it would be a thousand pities were it to be left incomplete.

MR. CARL ROSA issues an attractive programme for the approaching English-opera season, which will commence on Monday, September 11. The opening work will be Cherubini's *Water-Carrier*, the production of which, last season, was so heartily welcomed in musical circles. Sir J. Benedict's *Lily of Killarney* will be performed with alterations and additions specially written for this company by the composer. Among the promised novelties may be mentioned *Joconde*, by Nicolo Isouard; *Giralda*, by Adolphe Adam (both for the first time in England); a new opera entitled *Pauline*, composed especially for this company by F. H. Cowen; Beethoven's *Fidelio* (as originally composed—without recitatives); and, last not least, Wagner's *Flying Dutchman*, for the first time in English. The engagements are announced of Mdlle. Ida Corani (her first appearance with this company), Miss Cora Stuart, Miss Giulia Warwick, &c.; Messrs. Santley, Henry Nordblom, Aynsley Cook, Celli, &c.

THE reception given to Mdlle. Christine Nilsson by her fellow-countrymen, on her return to Sweden after several years' absence, is described as most enthusiastic. All the ships in the harbour of Malmö were decorated with flags, and the shore was thronged with spectators anxious to greet her arrival. A concert was given at Stockholm on August 10 in a church, no concert-room being found large enough for the accommodation of the numerous applicants for admission.

THE *New York World* says that the prospects of the next opera season are, so far, not favourable, Mr. Mapleson having been forced to abandon his idea of giving a series of performances there, owing to the refusal of Mdlle. Tietjens and Mdlle. Trebelli-Bettini to visit America. Of the regular Italian Opera in New York very little is at present known, but, it is understood, a company is being formed for a season of Italian opera at the Academy of Music for one month, from November to December.

MARCHETTI'S *Ruy Blas* will be produced next season at the Grand Opera at Dresden.

BIRKBECK BANK. Established 1851.

29 & 30, Southampton Buildings, Chancery Lane, W.C.
DEPOSITS received at INTEREST for stated periods or repayable on demand. On Current Accounts, interest allowed on the minimum monthly balances. Cheque Books supplied, and Letters of Credit and Circular Notes issued.

The Bank undertakes the custody of Securities of Customers, and the Collection of Bills of Exchange, Dividends, and Coupons. Stocks and Shares purchased and sold, and advances made thereon.
Office hours from 10 till 4, excepting Saturdays, then from 10 to 2.
On Mondays the Bank is open until 9 in the evening.

A Pamphlet, with full particulars, may be had on application.
FRANCIS RAVENSCROFT, Manager.

BANK of SOUTH AUSTRALIA. Incorporated by Royal Charter, 1847. DRAFTS ISSUED upon Adelaide and the principal towns in South Australia. Bills negotiated and collected. Money received on deposit at agreed rates. Apply at the Office, 31 Old Broad Street, E.C. WILLIAM PURDY, General Manager.

LITERATURE.

CELTIC SCOTLAND.

A History of Ancient Alban. By William F. Skene. Vol. I., History and Ethnology. (Edinburgh: Edmonston & Douglas, 1876.)

How much of the history of Scotland prior to the reign of Malcolm Canmore can be reclaimed from oblivion is the question which, with the industry of a scholar of the German rather than the English type, Mr. Skene in all his writings has kept steadily in view. Persons acquainted with the Preface and Contents of the *Chronicles of the Picts and Scots*, published under the direction of the Lord Clerk Register, and the Preface to the new edition of the *Scottichronicon* of Fordun, in the series of Scottish Historians, for which historical students have to thank the enterprise of Messrs. Edmonston & Douglas, will find something, though not much, that is new in the present volume of *Celtic Scotland*. But it may be feared that the readers of these books are rare, and we now have for the first time in a connected narrative, and in a form accessible to the general public, the reconstruction—for it is nothing less—which Mr. Skene proposes for those dark centuries which elapsed between the time when Agricola defeated Galgacus and the vivid light of the greatest Roman historian left the wilds of Caledonia, and the time when, by the marriage of Malcolm Canmore with Margaret, Scotland was brought within the circle of certain history. Opinions will differ now, as formerly, as to the use of trying to form a definite conception of this period of the annals of a semi-barbarous race, and as to the success which has attended the present attempt. There are those who, remembering the large amount of ink spilt in the great battle of the Picts in which Chalmers and Pinkerton were the chief combatants, or who, turning with disgust from the fictitious history as told by Boece or Buchanan, will believe such enquiries waste of time and an exhibition of perverted ingenuity. All readers or writers of history who date its commencement from the appearance on the stage of individual characters, and that interest which attaches to following the fate of men and women, will certainly do well not to enter on this branch of historical investigation. But that the beginning of nations, their proper names, languages, migrations, and settlements, their religious and other customs, and their character, truly belong to history, even before we can fix a date or describe a single charac-

ter with clearness, is an opinion which has sufficient adherents not to trouble itself overmuch with those who belong to the opposite camp. One consideration may, however, be presented to their candour. Surely it is cowardly, now that the comparative study of languages, of races, and even of myths, has yielded some indubitable results, to abandon an attempt to pierce still further into the past of our own race, in which predecessors so much less adequately equipped made such gallant efforts. We at least feel grateful to writers who, like Mr. Skene, train themselves by careful study to act as guides in this difficult voyage of discovery, and, while not hesitating to point out where their route appears uncertain or erroneous, shall not refuse due honour to them for their additions to our historical knowledge. It will be the object of this notice to mark some points which have been made certain or reasonably probable chiefly by Mr. Skene's researches—though he has not been in some points without coadjutors among Irish and Welsh scholars—and also what appears to be doubtful or positively wrong in his positions. The three propositions which Mr. Skene in his Introduction rightly says lie at the threshold of Scottish history: (1) that Scotia, prior to the tenth century, was Ireland—Ireland alone; (2) that when applied to Scotland it was a new name superinduced upon the older designation of Alban; and (3) that the Scotia of the three succeeding centuries was limited to the districts between the Forth, the Spey, and Drum Alban (the range of hills from Ben Nevis to Ben Macdhui), is clearly proved by the catena of authorities given in the important note at page 3. This view is not new, but has never been so precisely expressed. In his first two chapters the Roman advance to the Forth and Clyde and the Roman province in Scotland are treated with a continual reference to the original authorities which is refreshing in contrast to the constant repetition of a second-hand tale with which most historians, both of England and Scotland, satisfy themselves. This part of Mr. Skene's work demands the attention of every student of the history of Britain, and the gauntlet is thrown down on more than one point to almost all previous writers on this subject. The critical character of the writer's mind prevents him from accepting any result without examining it for himself, and a certain bias in favour of differing from others is evident. While admitting the justice of Mr. Skene's observation that Bertram's *Richard of Cirencester*, though now an acknowledged forgery, still colours much that is commonly accepted on this subject, we shall instance one or two cases where Mr. Skene's own views appear doubtful or untenable. He attacks, for example, every one of Wex's celebrated readings from the Vatican MSS. of the *Agricola*, upon which the questions turn whether Agricola, in the third year of his campaign, reached the Tay or only some undiscovered estuary called the Tanaus, south of the Forth and Clyde, and also what was the name which the Romans gave to the mountains where four years later Galgacus fought the battle of freedom, which though lost determined the bounds of the Roman con-

quest. The old reading of "Taum (aestuario nomen est)" (*Agricola*, cap. 22) is defended, first, on the authority of Ptolemy's *Tauu*, which must be admitted to raise a probability in its favour; and, second, on the ground that *n* can scarcely be distinguished from *u* in such MSS., *Tavum*, not *Tanaum*, is conjectured to be the right reading. But surely on such a point we are bound to trust those who have made the collation, which Mr. Skene has not done. Wex's readings do not rest on his own authority or Mr. Burton's support, but on the testimony of more than one German scholar (Mommson among them). Nor can it be disputed that the evidence of the context, though not absolutely incompatible with the Tay being the estuary intended, applies more naturally to some firth or river south of the Forth, as Agricola is stated to have embraced in his operations the States beyond that river only in the sixth year of his office. What the river was, notwithstanding Wex's ingenuity, still remains unknown, for we cannot think any of the three conjectures—the Tyne, the Forth itself, or the Solway—at all plausible. For the Mons Graupius, which Wex's MSS. have instead of Grampius, Mr. Skene substitutes Granpius, on no other ground than the "rarity" of the combination of a *u* with a labial in Celtic (a ground surely inadequate when all we have is a Latin writer's attempt to represent a word of a language unknown to him), and he summarily dismisses Wex's reading of "Boresti" for "Horesti" on the authority of Mr. Roach Smith's rendering in an inscription at Neuwied of the words "*Hor. N. Britanorum*" as "*Horestorum numeri Britanno-*" This, he observes, "seems to leave no doubt as to Horesti being the correct form, and does not inspire one with much confidence in Wex's new readings, sanctioned as they are by Mr. Burton." Unfortunately, Mr. Roach Smith bases his rendering on the fact that "the *Horesti* are mentioned by Tacitus" (*Collectanea Antiqua*, ii. p. 135). Of more general interest is the new position which Mr. Skene assigns to the Roman provinces of Britannia Prima, Britannia Secunda, Flavia and Maxima, Caesariensis and Valentia. About the last he makes the singular remark:—

"In the absence of any trustworthy evidence as to its position, and looking merely to the slender indications from which any inference may be drawn, we do not hesitate to pronounce that the true Valentia was that part of the province most exposed to the attacks of the Scots, and afterwards called Wales."

It is true that the evidence is slender, but, if so, surely hesitation rather than confident assertion should be the disposition of the critical historian. We agree with Mr. Skene that the order in which the *Notitia Utriusque Imperii* twice names the provinces—(1) Maxima Caesariensis, (2) Valentia, (3) Britannia Prima, (4) Britannia Secunda, (5) Flavia Caesariensis, and the accompanying diagram (C. xxii. Böcking's edition, 74)—throws some doubt on the common theory as to their position, but we cannot concur with him in thinking that the "*recuperata provincia*" of Theodosius in Ammianus Marcellinus, xxviii. 3, 7, to which the name of Valentia was given, is more ap-

plicable to Wales than to the country between the walls of Hadrian and Antoninus, or that this country was most exposed to the attacks of the Scots. It is curious that at p. 97 Mr. Skene considers Upper Britain in the division of Constantine to have consisted of *Britannia Prima* and *Flavia*, and at p. 103 of *Britannia Secunda* and *Flavia*. In treating in the fourth chapter of the *Ethnology of Britain*, and in the fifth of the *Four Kingdoms of Scottish Dalriada*, the Picts of the North East and Central districts, the Britons of *Alclyde* (which he does well to substitute for *Strath-Clyde*, an incongruous name for the district south of the source of the Clyde, as well as the Clyde Valley), and *Anglian Bernicia*, Mr. Skene is on surer ground. The result is to confirm the memorable statement of Bede i. § 7: "The island at the present time [*i.e.* 731 A.D.] following the number of the books in which the Divine Law was written, contains five nations—the Angles, Britons, Scots, Picts, and Latins," although, like previous writers, he does not seem to have seized the full significance of the assertion of the continued existence of a Latin-speaking population. This, perhaps, falls beyond his proper subject, for the Latin-speaking population of the towns to which Bede clearly alludes did not exist within the bounds of modern Scotland. In this part of the subject we must, however, note two points on which Mr. Skene's conclusions fall far short of historic certainty. The assumption of a Basque race prior to the Celts of Britain, though there are many points in the legends which he collects that dispose us to find historic ground for it, is certainly not established by the anthropological argument of Dr. Thurnam, or the archaeological researches of Mr. Dawkins and others. The opposite conclusions maintained by the most competent observers on the question to which race the long and short skulls respectively belonged, and the wise hesitation of Prof. Rolleston, place this enquiry beyond the sphere of history; nor can we regard Dr. Thurnam's hypothesis, that the oval skulls are the intermediate forms which would result from an intermingling of the two races, as anything more than a bold attempt to escape from a difficulty which would upset his theory.

As regards the Pictish language, Mr. Skene's conclusion, which is that it more nearly resembles *Gadhelic*, the Irish Gaelic, than *Cymric*, the British Welsh, must await the criticism of competent Celtic scholars. Meantime, judging the case as a lawyer may do any question of evidence, while we think he succeeds in displacing the arguments in favour of the Pictish being a *Cymric* dialect which Mr. Isaac Taylor and others have drawn from the local distribution of the Pens, Invers, and Abers, we venture to doubt whether there is any sufficient basis for finding a Cornish element in the meagre list of the Pictish kings.

In the fifth chapter the history of the four kingdoms of *Dalriada*, *Alclyde*, *Pictavia*, and *Bernicia* is traced with as much distinctness as the subject appears to admit. That part which treats of the great Northumbrian kingdom, whose prominence in the seventh and commencement of the eighth century, and probably the fact that Bede

belonged to it, led to the Anglian name instead of the Saxon being extended to all England, is of special interest. This is common ground of early English and early Scottish history, and has never been placed in so clear a light. For the due understanding of it requires the clear appreciation of its relation with the Celtic Church of Columba, which is only possible to a student of the early Celtic annals of Ireland and Scotland. The necessary materials are now, however, in the hands of every one in the third volume of Stubbs and Haddan's edition of Wilkins' *Concilia*. Much the most obscure portion of the history of this period is the position of the *Alclyde* British kingdom, and if Mr. Skene be right in assuming an independent settlement of Picts in Galloway the difficulties are increased. That there were Picts in that district in the time of Bede we know from that writer, and that they continued there so late as the twelfth century is certain from Henry of Huntingdon; but the absence of any trace of a separate kingdom favours the theory, which is at variance with Mr. Skene's philological hypothesis—conclusion it can scarcely be called—that the Picts were nothing else than the ancient Britons in the more remote and mountainous districts, and the Picts in Galloway nothing else than a portion of the *Alclyde* Britons.

In tracing, in his sixth chapter, the history from 731, when we are deserted by the clear light of Bede, to the middle of the ninth century when the Scots and the Picts were amalgamated under Kenneth Macalpine, Mr. Skene is on difficult ground and has to fight his way step by step over doubtful facts and still more dubious theories.

The clue by which he tries to interpret this period is derived from ecclesiastical history, and nothing is more probable than that the ecclesiastical determined or accompanied the civil changes in this age among a Celtic race. In 710, we learn from the sure testimony of Bede, *Nec'lan MacDerili*, after communicating with Ceolfrid the Northumbrian, Abbot of Wearmouth, conformed to the Roman Easter and accepted the tonsure, which, next to the more precise calculation of the Paschal feast, was the outward symbol of connexion with the centre of Western Christendom. At the same time he abandoned the looser discipline which the Irish Celts, perhaps, derived from the East, and which Columba and his followers had transmitted, not only to Scottish *Dalriada*, but even to Anglian Northumbria, and for a short time to Mercia, till the Council of Whitby, in 644, finally determined that all England was to be a province of Rome. Mr. Skene derives the name of Hill of Belief which was given to the Moot-hill of Scone from this momentous conversion, second only in importance to the original conversion of the heathen Picts to Christianity by the preaching of Ninian and Columba; but this is contrary to the Pictish Chronicle, which ascribes that name to the union, in the beginning of the tenth century, by Constantine MacEdh and Cellach, the Bishop of the Scotch and Pictish Churches. The expulsion of the Columban clergy in 717 across Drum Alban to their original seats in Scottish *Dalriada*, which is recorded by Tighernac, followed as a matter of course,

just as their retreat from Northumbria had followed the Council of Whitby.

The next point which arrests the attention is the long reign of the most powerful of all the Pictish kings, Angus MacFergus, from 731 to 761. Some confusion exists, owing to the mention of at least two other monarchs of the same name, but Mr. Skene has, we think, succeeded in showing that the foundation of St. Andrews was the act of this king; his view on this point has been followed by Mr. Haddan. The remaining facts about Angus, recorded by the meagre entries in Tighernac and the Annals of Ulster, are his defeat of three local Pictish chiefs, Drust, Alpin, and Nectan—perhaps the same to whom Ceolfrid wrote—thus making himself supreme over the Pictish race; his annexation of *Dalriada* between 736 and 741; his war with the Britons of *Alclyde* in 750, when his brother, Talorgan, was slain, but which ended successfully through his alliance with the Northumbrian king Eadbert in 756, when *Alclyde* (*Dumbarton*) was taken (for there appears little doubt that he is the Pictish king *Unuist*, of Simeon of Durham); the removal about the same time from Iona to Ireland of the relics which Adamnan had collected by the Abbot Cilline Droichteach (the bridge-maker); and his death in 761, when he is described by the continuator of Bede in words appropriate to his warlike reign, "*qui regni sui principium usque ad finem facinore cruento tyrannus perduxit carnifex.*"

What Mr. Skene calls the suppressed century of *Dalriadic* history, from the death of Alpin, son of Eochaidh, in the middle of the eighth century to the union of the Pictish and Scottish kingdoms, by Kenneth, the son, according to Mr. Skene, of another Alpin, in the middle of the ninth century, is much more doubtful ground. The basis of this theory is shown most clearly in the table of the kings of *Dalriada*, according to Flann of Monaster Boice, the *Duan Albanac* and Tighernac, compared with the Scotch chronicler, Fordun, printed at p. 403 of vol. ii. of Mr. Skene's edition of Fordun. This, as well as the tables of the Pictish and *Alclyde* kings there given, we should have liked to see reprinted in the present work. Mr. Skene is undoubtedly well-founded in the remark that these Irish authorities of the eleventh century are of more weight than Fordun's fourteenth-century chronicle, and their coincidence is remarkable, though it may have arisen only from their all copying some one source now unknown to us. The victory mentioned by Tighernac of Angus MacFergus over the *Dalriads* in 736, it is clear, denotes no ordinary conquest; but it must be confessed that the theory that it resulted in a century of Pictish supremacy, whose history was defaced when Kenneth Mac Alpin restored the sovereignty of the Scottish race, in order to bring his descent in a continuous line from the *Dalriad* kings, has difficulties of its own. One of these is to discover who was Alpin the father of Kenneth, and this Mr. Skene tries to overcome by a novel suggestion, founded on a tract of the fourteenth century, that he belonged to a clan of the *Dalriads* called *Conall Cerr*, who settled in

Fife (*Chronicles of Picts and Scots*, p. 315), which must be admitted to be slender evidence of a fact nowhere else mentioned. Much more is to be said in favour of the view that Alpin was a Pict on his mother's side; and, as maternal descent was deemed sufficient legitimacy in the Pictish royal family, that his succession did not make so great a break in the line of kings as was afterwards supposed. It seems, indeed, to be proved with reasonable probability from the fact that several of his successors, as well as Kenneth himself, are called kings, not of the Scots, but of the Picts; and, when the title was changed at the close of the ninth century, that it was changed into King of Alban, and not for 100 years later, in the reign of Malcolm MacKenneth, into Rex Scotiae; that the Picts were never completely destroyed, but their name was only gradually supplanted by that of the ruling race of the Scots, who probably did not greatly differ from them in language or customs. Space prevents notice of the three concluding chapters of this work, which deal with the kingdoms of Alban and of Scotia, and the transition of the latter, chiefly through the influence of David I., from a Celtic into a Feudal Norman monarchy, differing little in the outer form of its government from the Feudal monarchy which the Normans superimposed on the Saxon institutions of England, though differing much in its internal conditions. Some of Mr. Skene's conclusions will probably not survive the test of criticism or the fuller knowledge of Celtic history which it is reasonable to expect when the inhabitants of Britain begin seriously to study the Celtic language; but we feel certain they will not be neglected by subsequent investigators. Both in its historical and linguistic aspects this period of our history has been too much left in the hands of Irish scholars, who—though there are one or two brilliant exceptions, like Mr. Stokes and Dr. Reeve—are generally deficient in the critical faculty.

It would be difficult to over-estimate the service Mr. Skene has done by presenting us, not only with the conclusions at which he has arrived, but also with the documentary evidence on which they rest.

His promised volumes on the Celtic Church and Celtic Land System all persons interested in the earliest period of the history of Britain will look forward to with expectation. It would be a mistake to regard his labours as having an exclusive bearing on the history of Scotland. Scotland is no doubt their immediate object, and for Scottish history they have their chief value. But they are in truth a survey of the historical development of that pre-Teutonic Celtic population once inhabiting the whole island, but which circumstances enable us to study in Scotland better than in any part of it except Wales. They form, not merely a useful, but a necessary counterpoise to that one-sided theory of the so-called English origin of the present inhabitants of Britain which, though it leads to no important error as regards the Constitution, which is an almost purely Teutonic and Norman growth, is a complete misinterpretation of the facts as regards both the race and the genius of our fore-

fathers, who were not a pure but a mixed race, in which Celtic, as well as Scandinavian, Teutonic, and Norman elements have mingled. We have at last a native work on Celtic history which we need not be ashamed to compare with Ferdinand Walter's *Das alte Wales*, and which is the first distinct advance that has been made in our knowledge of Celtic history since Father Innes wrote in 1729 his *Critical Essay on the Ancient Inhabitants of Scotland*.

Æ. J. G. MACKAY.

Transcendentalism in New England. A History, by Octavius Brooks Frothingham. (New York: Putnam's Sons; London: Sampson Low & Co., 1876.)

THE phrase "Transcendental movement," sometimes used in America to designate the subject of this history, possesses significance. It is as a "movement" rather than as a philosophical development that American Transcendentalism exhibits features to some extent unique. Towards the close of a long phase of an interminable dispute, which had been especially concerned with metaphysical definitions, generally supposed to be dry and unpractical, represented in Europe by a kind of dialectics which, though in some cases mingled with ethical and religious speculations, on the whole impressed theologians as implying a cold scepticism among scholars which could happily have no meaning for the common people—suddenly there starts forth amid one of the most practical communities in the world an enthusiasm of almost revolutionary strength, with the philosophical terms of the Old World for its watch-words! Simple farmers, prosaic merchants, political editors, school-teachers, preachers, college-students, are found gathering together, or moving about as propagandists, writing and sometimes singing new hymns about the Ideal and the Absolute, and proposing to reorganise their domestic, social, and public life on eternal principles. It is a striking fact that such should have been the character of the only "movement," in a hundred years of American history, corresponding to those of Fox and Wesley in this country in their warmth and practical effect. Unlike the English "revivals," the Transcendental excitement has left no distinctive organisation, and the social experiments to which it gave rise have passed away. But its results are sufficiently salient. It caught up the anti-slavery movement, and gave it that place in the sympathy of scholars and religious teachers which assured its success; it created the agitation for the equality of woman, which has modified American law to an important extent; and it reduced to a conventionalism the old Unitarianism which had become the religion of the educated in New England, but which, hardly less than the Puritanism it superseded, regarded its doctrines as a finality, and discouraged all enquiry except as against orthodoxy.

Mr. Frothingham possesses some peculiar qualifications for writing this history.

"The writer," he says in his preface, "was once a pure Transcendentalist, a warm sympathiser with Transcendental aspirations, and an ardent admirer of Transcendental teachers. His ardent may have cooled; his faith may have been modi-

fied; later studies and meditations may have commended to him other ideas and methods; but he still retains enough of his former faith to enable him to do it justice."

These words, however, but inadequately suggest the relations of Mr. Frothingham to his subject. Not only as one who, against the conservatism by which he was surrounded from childhood, espoused the anti-slavery cause, but also as President of the Free Religious Association, which, if not the direct offspring of Transcendentalism, is its chief heir, has the eloquent minister of New York participated in the history he records. On the other hand, such antecedents place the historian under some disadvantages of which he can scarcely be conscious. His experience can hardly fail to interpret for him the general history, and determine too much the importance of each actor and event.

Of that fourth of the volume devoted to studies of the Transcendental philosophy in Europe, the chapters awarded to Germany are excellent, that relating to France meagre, and that on England more meagre still. Even in an outline like this it might have been expected that justice would be done to Bishop Berkeley; but he is hardly mentioned, while Kant is named as having founded Transcendentalism, anno 1781. The extent to which Kant is indebted to Berkeley may be a matter of discussion, but of the fact itself, as Prof. Huxley has pointed out, there can be little doubt. More remarkable is the absence from this history of any clear recognition of the influence upon American thought of Carlyle, who is said by Emerson to have spoken to American youth in those days with an emphasis that deprived them of sleep. The large credit ascribed to Coleridge becomes disproportionate beside references to Carlyle which regard him as a mere purveyor of German works. There are also some portions of the History in which we might naturally have looked for some mention of Emerson's friends, John Sterling, Arthur Clough, and others. Such estimates and omissions are, however, not limited to that part of the volume which relates to Europe. Less accountable is the absence from it of all but the name of Thoreau, the charming author of several works particularly characteristic of the Transcendental faith, which found in him its Rousseau. The recognition of Carlyle might have been better spared than that of the naturalist and hermit of Walden, the most picturesque figure of all, who shared Mr. Alcott's imprisonment for refusing on idealistic grounds to pay taxes to the State. Nor has justice been done to Miss Elizabeth Peabody, or to Mrs. Child, author of *The Progress of Religious Ideas*, the best contribution to the comparative study of the religions of mankind which has come from America.

As the first attempt at a serious study of the religious, social, and philosophical elements of a movement which so many have been ready to vanquish, like Berkeley, "with a grin," the work of Mr. Frothingham is of high value. It has the merit of being the only book from which the part borne in that movement by its chief representatives can be ascertained and measured. With judicial fairness and with delicate apprecia-

tion the author portrays, in that subtle and suggestive language of which he is master, the great types of mind and character around whom the visible effects of their influence are but frame and foliage. Ralph Waldo Emerson, and his brother Charles, Margaret Fuller, A. Bronson Alcott—who deserves to be better known to the many English homes in which the stories of his daughter Louisa have found such welcome—and others of less note, but of much interest, find their right and relative places in this fine tapestry. The religious side of the agitation, of which it need hardly be said Theodore Parker is the foremost figure, is here brought out with tact and learning. To Theodore Parker, probably, is chiefly due the somewhat singular fact that the Rationalism of the time was so rarely invested with any Obscurantism, or with such patristic and Biblical phraseology as it assumed with Coleridge and Schelling, and with Swedenborg—the last-named of whom, by the way, might surely have been included among the influences which worked in the more mystical phases of Transcendentalism.

The facts relating to the Brook Farm community, of which Hawthorne has drawn a picture both idyllic and tragic in his *Blithedale Romance*, are fully given. About seventy persons, chiefly young, only eight being married, gathered to this farm near Boston. They were from various sects, and of various degrees of culture. Their constitution declared their object to be a higher intellectual and moral culture, and to impart a greater freedom, simplicity, truthfulness, refinement, and moral dignity to their mode of life. Their food was to be raised on the farm or purchased at wholesale. Their meals were taken in "commons." All must labour, choosing their occupations, and hours, and receiving wages according to the hours; and all labour was rewarded alike. But it was expected that the intellectual should work sometimes with their hands, and the unintellectual be allowed time for mental cultivation. The object was not wealth, but a comfortable subsistence to all, with the view of securing freedom for the higher nature. The association was hospitable, and became a resort for various eminent persons who did not unite themselves with it. Its school was celebrated. But the individualities brought together were too pronounced for perfect organisation. Each had his or her own aim, and the elements were discordant. However, Mr. Frothingham declares—

"that a mere aggregation of persons, without written compact, formal understanding, or unity of purpose, men, women, and children, should have lived together four or five years, without scandal or reproach from dissension or evil whisper, should have separated without rancour and bitterness, and should have left none but the pleasantest savour behind them—is a tribute to the Transcendental faith."

Of the persons who lived there several have become widely known in the work of journalism, as Mr. George W. Curtis, Mr. George Ripley, and Mr. Dana, all distinguished editors of New York. In one sense the association did not fail. The beautiful monument it gained in the romance of Hawthorne, so admirably supple-

mented by the narrative of Mr. Frothingham, will long remain to remind generations that the great world must always prove too strong for any attempt at an isolated perfection. A new world cannot be created *per saltum*. The world goes on evolving its social institutions—its temples, and cathedrals, and railways, and clubs—by force of use, just as far and as rapidly as they are consistent with the sacred reservations which are essential to individual evolution. The real self each sought at Brook Farm was not found there but lost:—

"The real Me," writes Hawthorne, "was never an associate of the community; there had been a spectral Appearance there, sounding the horn at daybreak, and milking the cows, and hoeing the potatoes, and raking hay, toiling in the sun, and doing me the honour to assume my name. But this spectre was not myself."

The influence of Transcendentalism in America has not passed away with any of its special manifestations. It remains as a thing proved that the finest type of character, the devoutest moral aspiration, and a passionate religious enthusiasm, may be derived from simple faith in ideas and ideals. It is not difficult to find in this history not unworthy counterparts of St. Francis d'Assisi, of Fénelon, of Berkeley, and Wilberforce. Self-denial without asceticism, scholarship without pedantry, the brave effort at plain living with high thinking, characterise the subjects of this honourable record. It is a satisfaction to know that, though the remorseless world may disperse such communities as Brook Farm, it only thereby takes into itself as a leaven their aspiration and fidelity; and though new conceptions of nature and truth may turn the Transcendental philosophy as taught by Emerson and his friends into "an intellectual episode," we may feel assured that the flavour of the old fruit will survive to enrich the new.

MONCURE D. CONWAY.

Life with the Hamram Arabs. By Arthur B. R. Myers, Surgeon Coldstream Guards. (London: Smith, Elder & Co., 1876.)

THIS is simply the journal of a sporting tour in the Soudan, undertaken by Mr. Myers and two or three other officers of the Guards during the winter of 1874-75. The object was to shoot big game, not to explore, and consequently any addition to our meteorological and geographical knowledge is incidental. Landing at Souakim, 750 miles south of Suez, the party crossed the desert to Kassala without any important adventures; but those who intend to follow the same route will do well to profit by their experience in the way of camels, servants, &c. After a sixteen days' journey Mr. Myers and his companions arrived at Kassala, the capital of the Soudan country, and the great military centre of this portion of the Egyptian dominions. The governor of the district, Munzinger Pasha, is described as a firm but just administrator, very energetic in developing the resources of the country. It is sad to have to relate that this exceptionally good Egyptian governor has been recently murdered during a tour of inspection. Mr. Myers was informed, when at Kassala, that, though slave-dealing was still secretly carried

on, the risk to the dealer had become so great that the practice would in time die out. "When slaves are captured by the Government, the boys are drafted into the army, and husbands are generally found for the girls." Striking south from Kassala, Mr. Myers and his companions reached the Hamram country after a four days' journey. The shooting then began in earnest, and Captain Kirwan soon shot an elephant without much risk or difficulty. Mr. Myers also wounded one, but he got away. In the course of the first week a running shot was obtained at a lion; the animal, however, escaped. Rhinoceroses, hippopotami, buffaloes, and lions were occasionally met with, but were seldom bagged, and still more seldom showed good sport. Indeed, it would seem that, owing to the improvements in fire-arms, the risk in hunting wild animals has largely diminished. The consequence is that, though an instructive guide for those who may select the Hamram country as a shooting-ground, Mr. Myers' journal is not very exciting. The rhinoceros is believed to be a dangerous animal. There would seem, however, to be some exaggeration in this matter, to judge from the following passage. Discovering two rhinoceroses asleep, Mr. Myers crept on

"until within fifteen or twenty yards of them, when I could just make out that one was lying with his legs towards me, and the direction in which his head would be. While choosing the best spot to aim at, something moved; it was only a little wag of the ear, but it announced that the sleeper had awoke, and instantly a ball from my eight-bore penetrated his thick hide under the right shoulder. The only effect for the moment was to make both animals spring to their feet and to start off, one to the right, the other to the left, in the direction they were lying. The wounded one, however, hardly went a yard before he faced round upon me, and, with head high in air, looked like meaning mischief; but another ball entering the front of his chest cut short his career, and he fell heavily to the ground uttering a faint cry, and was dead before Essafi reached him."

Nor were the lions more formidable. Lord Coke, seeing one stealing away twenty yards off, fired and hit him in the thigh. On his rushing after the lion the animal turned round, and, with one loud roar, came towards them at a trot. Lord Coke waited for him, when, just as he was pulling the trigger, "a tug from behind brought him nearly on his back." The tug was administered by his native hunter, who became alarmed and wanted his master to run.

"There was nothing now left for it but to run for his life, and off he went as fast as his legs would carry him, expecting every moment to feel a gentle pat on the back. Most fortunately there was a hill close in front of him, and having gained this he was safe, for his wounded enemy could no longer follow him; and, while crouching in the grass at the bottom and growling at his ill luck, he received his death-blow."

The most dangerous adventure was one with buffaloes. Hearing one night that a herd was close by, two of the party hastened towards them.

"The moon, partially obscured by clouds, only gave us sufficient light to allow us to distinguish an immense black mass until we crept up to within perhaps thirty or forty yards of them, when we could make out a general outline of the nearest, and into these we fired our four barrels. Never could buffaloes have been more startled

from their peaceful avocations than were these on seeing such volumes of fire suddenly bursting upon them; and, leaving two wounded companions behind, they tore along the bank in headlong flight, raising such a cloud of dust that they were instantly lost to sight. To please our men, all of whom had turned out, we went on, and when the buffaloes left the bank and entered the woods we soon gained upon them, for owing to their great number, exceeding certainly one hundred, the trees checked their advance greatly, until another volley made them rush up a hill with a noise almost like thunder, as the branches were smashed in their mad career. We still followed them, and, on reaching the crest of the hill, found them again within sight; and, the moon at the moment aiding us, we were each able to pick out a fine bull and drop him. We had now used all the ammunition we had snatched up before starting, and were resting quietly before returning home, when we noticed that the herd had also halted, and, like a regiment, was drawn up in line on the high table-land beyond us. In another moment a wild cry from the Arabs that the buffaloes were coming proved only too true, and so rapidly that it became a case of *saue qui peut*, and down the hill we tore, and some way beyond it, before we felt quite sure of having distanced the enemy."

The result of that night's work was that five buffaloes fell to nine shots. Lord Coke on one occasion was chased by a wounded rhinoceros, and had some difficulty in escaping; but, to judge from Mr. Myers' journal, all the big game endeavoured to slink away at first, and even when wounded seldom charged with the vigour and speed of the Indian tiger or the Ceylon elephant. Moreover, they did not display the wonderful tenacity of life commonly attributed to them. The last part of the book will possess interest for the many friends of the late Earl of Ranfurly, for it gives a simple yet touching account of the last days of that popular young officer. At one time he seemed to have a fair chance of recovery, for under Mr. Myers' skilful treatment and unwearied nursing the dysentery was cured, but he could not rally, and died the very day he embarked at Souakim on his return journey.

The fault of the book is that it is a little too long, but the story of Mr. Myers' adventures is told in a simple, unaffected manner, and impresses us with the conviction that better comrades on a wild sporting expedition than the party of which he was a member could scarcely be found.

W. W. KNOLLYS.

Parthenophil and Parthenophe. By Barnabe Barnes. Edited by the Rev. Alexander B. Grosart. (Printed for the Subscribers, 1875.)

THE later years of Elizabeth's reign are distinguished in the history of our literature not only by the wonderful mirroring of human life in the drama, and by the massive wisdom of such writings as those of Hooker and Bacon, but also by an outbreak of pure singing—singing like that of early summer, when the eagerness, the keen ecstacy of spring has not yet departed, but has been enveloped in the richer enjoyment of days filled full of sunshine and unabashed flowers. The singers of *Tottel's Miscellany* seem but finches compared with the full-throated choir

of nightingales that are heard from *England's Helicon*. One inspiring motive is common to all these later Elizabethan lyrical poets—a passionate delight in beauty. They do not need ideas, or abstractions, or memories of the past or hopes for the future: it suffices them to be in presence of a bed of roses, or an arbour of eglantine, or the gold hair of a girl, or her clear eyes, bright lips, and little cloven chin, her fair, shadowed throat, and budding breasts. She shall be a shepherdess, and the passionate shepherd will cull the treasures of earth, and of the heaven of the gods of Greece and Rome to lay before her feet.

Among these singers it is strange that one of the most exquisite should have passed out of sight. The unique copy at Chatsworth of Barnabe Barnes's *Parthenophil and Parthenophe* has been now for the first time reprinted by Mr. Grosart on behalf of thirty subscribers. His better known *Divine Centurie of Sonnets*, variations on sacred themes, written perhaps to make amends for his vain amatory songs, are of the nature of pious exercises undertaken ardently, but without that unction which distils itself from a long-nourished, secret, spiritual life. Up to the age of twenty-five or thereabouts Barnabe Barnes, the son of the second Protestant Bishop of Durham, was a devout believer in the gods of the Renaissance, and Saint Cupid was his patron. We do not know whether his French stepmother was more intimate with the *Trueness of the Christian Religion* by Philip of Mornay or with the odes and sonnets of Ronsard and Du Bellay. The good seed sown by the bishop, if it grew up, certainly sprouted side by side with a speedier growth of corn-cockle and fluttering poppies; and the bishop died while his son was still a boy. After a residence at Brazenose College, Oxford, where his servitor, John Florio, may have regaled him with scraps gathered from a feast of languages, Barnes served as a soldier against "that fair enemy, France," under the Earl of Essex. His residence in France both as a boy and in early manhood seems to have been of considerable length, and the gaiety and elegance of the poetry of the *Pleiad* can hardly have failed to charm and to refine his instincts for art. This concerns us more than any prowess or cowardice of the youthful soldier, and Nash's scurrilous accusations against a friend of Gabriel Harvey may be allowed to sink into the sewer of uncomely things to which Nash was a copious contributor.

In the same year in which a young poet from Stratford dedicated to the Earl of Southampton the "first heir of his invention," Barnes published his collection of sonnets, madrigals, elegies, and odes, entitled *Parthenophil and Parthenophe*. Among several poems commending his verses to noble and beautiful persons is one addressed to Shakspeare's patron. *Parthenophil* is evidently suggested by Sidney's *Astrophel*; and *Parthenophe* is the virgin, cruel in her maidenhood, who is wooed but who will not be won. The love-story is probably a real one. From his fourteenth year the poet had yielded his heart to Venus Victrix in many forms of girlhood, and at last to *Laya*;

but a youthful squire, the poet's rival, attracts the eye of *Laya*, and while she glazes with him, *Parthenophil's* heart escapes, and takes refuge with *Parthenophe*. Occasionally a real incident of the love-story becomes apparent—a request to accompany his lady when she leaves the town, which she refuses; the gift of a glove; *Parthenophe's* sickness; a May-day merry-making; an anniversary of Sidney's death, when Colin (Spenser) sits singing underneath the oak, and *Stella* weaves chaplets "with gold and scarlet dyed" in memory of her lost shepherd, and the huntress *Parthenophe* returns with spoils of "three great hartes;" and there is record of the first kiss, which causes in *Parthenophil* a like whirling rapture to that in which the lover of Mr. Tennyson's *Maud*, losing distinction in his joys, finds in a girl's consenting word the bond which shall make one in happiness earth's parted hemispheres. In the main, however, the poetry of Barnes moves in a world of imagination, into which the virtue of any real incidents has entered invisibly through the solvent of beauty; it is a land of clear colours, and smooth air; a "region of shadowless hours;" mighty Pan presides over it; the lovely Virgin *Mary* is a shepherdess who may be gained by the promise of a firstling of the flock to further lovers; *Apollo* is a saint of the religion of joy. But it is not only the Renaissance with its rehabilitation of the senses which we find in these poems; there is in them also the Renaissance with its ingenuity, its fantasticality, its passion for conceits, and wit, and clever caprices, and playing upon words. With this it is harder and perhaps not wholesome to attempt to enter into sympathy. The sympathy of the most favourably disposed modern reader would be somewhat stringently tested by a poem of many lines in which the marks of punctuation, comma, and colon, and period, are constrained to become the emblems and exponents of passion.

The volume being still almost unknown, and quite unprocureable, it may be permitted to give some specimens of what is beautiful and characteristic in the poetry of Barnes. The following Madrigal embodies no strong passion, but possesses much of the elegance and graceful animation of Ronsard:—

"Once in an arbour was my mistress sleeping
With rose and woodbind woven,
Whose person thousand graces had in keeping,
Where for mine heart her heart's hard flint was cloven
To keep him safe; behind stood portly peeping
Poor Cupid, softly creeping,
And drove small birds out of the myrtle bushes
Scar'd with his arrows who sat cheeping
On every sprig, whom Cupid calls and hushes
From branch to branch, whiles I, poor soul, sat weeping
To see her breathe not knowing
Incense into the clouds and bless with breath
The winds and air, whiles Cupid underneath
With birds, with songs, nor any posies throwing
Could her awake:—
Each noise sweet lullaby was for her sake."

She still sleeps—"rest's mist with silver cloud had clos'd her sun"—sleeps, leaning on her elbow, while her poet, turned painter for the occasion, has time on his "platane table" to limn her beauty with vermeil, gold, white and sable; only the shadows of

the roses and woodbuds trembling on her face he did not essay to paint—

“—there art lost his grace,
And that white lily-leaf with fringed borders
Of angels' gold veiled the skies
Of mine heaven's hierarchy which clos'd her eyes.”

The pure and lovely colour is like that of some Italian picture unstained by time. In a vision the poet beholds the body of a nymph wrought in heaven, and brought down to earth, where it is laid upon a bank for the gods to bestow each his proper gift. (The word “Heliocrise” it may be noted means the flower *coma aurea*, or goldilocks.)

“Phoebus, rich father of eternal light,
And in his hand a wreath of Heliocrise
He brought, to beautify those tresses,
Whose train, whose softness, and whose gloss more bright
Apollo's locks did overprize;
Thus with his garland, whiles her brow he blesses,
The golden shadow with his tincture
Colour'd her locks aye gilded with the cincture.

HER BROWS.

Those lovely brows, broad bridges of sweet pleasure,
Arch two clear springs of graces gracious named,
There graces infinite do bathe and sport.

HER CHIN.

Proud Nature, which so white Love's doves did make
And fram'd their lovely heads so white and round;
How white and round? it doth exceed so much
That Nature nothing like thy chin hath found.

THE LOVE-GOD.

Love is a name too lovely for the god;
He naked goes red-colour'd in his skin,
And bare (all as a boy) fit for a rod;
Hence unto Africk! there seek out thy kin
Amongst the Moors and swarthy men of Inde.

PARTHENOPHE COMPOSED OF FLOWERS.

Blest be that shepherd nine times nine
Which shall in bosom these flowers keep
Bound in one posy, whose sweet smell
In Paradise shall make him dwell,
And sleep a ten times happy sleep.

UNJUST EXCHANGE.

Thine eyes, mine heaven, which harbour lovely rest,
And with their beams all creatures cheer,
Stole from mine eyes their clear,
And made mine eyes dim mirrors of unrest;
And from her lily forehead, smooth and plain,
My front his withered furrows took,
And through her grace, his grace forsook;
From soft cheeks rosy-red
My cheeks their leanness and this pallid stain.”

More passionate than any of these are the verses which describe the dream of a clear and silent moonlit night, wherein suddenly appears “a fiery boy outmatching the moonlight;” Cupid brings the lover to look upon Parthenophe; he beholds her lying on an ebon bed, with sable coverlid, and by the bed-side many little loves in black; Venus is seen veiling the face of the beautiful dead girl; the Graces kiss her and pass away; her lover stoops to lay his lips for the last time upon Parthenophe, when lo! it is a firebrand which he has kissed, and at the burning he starts out of sleep. The collection closes with a poem in unrhymed stanzas in which the scorned and rejected lover appears invoking Hecate in a wood with unhallowed rites at midnight; he beseeches that Parthenophe enraged with passion may be hurried to him, naked, on the black goat's back. At length, when the cumulating invocations and dark offices have reached a climax, the clouds divide,

and she appears borne onward by the daughters of the night. The poem ends with a frenzy of attainment, and completed union.

Barnabe Barnes was author of two dramas—the *Battle of Evesham* (lost) and the *Devil's Charter*, from which extracts are given by Mr. Grosart in his introduction; but it is as Parthenophil that he will henceforth be remembered. The editor may be congratulated on having brought into notice a volume of Renaissance poetry far more a work of genius than the *Εκατομπαθία* of Watson, or Constable's sonnets. In the series of occasional issues for subscribers, which includes the poems of Barnes, have appeared also Humphrey Gifford's *Posie of Gilloflowers*, and Griffin's *Fidessa*. But Barnes has made the companion volumes look pale. The fragrance of the “Gilloflowers” is more of the earth and less of the sun. The prime interest of *Fidessa* gathers around the sonnet which is common to it and to the *Passionate Pilgrim*. Mr. Grosart maintains that this sonnet belongs to Griffin, and not to Shakspeare. EDWARD DOWDEN.

Classical Antiquities. I. Old Greek Life.

By J. P. Mahaffy, M.A. History Primers Series. (London: Macmillan & Co., 1876.)

If the object of these Primers is to waylay youthful minds and carry them captive to regions where they will afterwards find hard toil and slow reward, then Mr. Mahaffy has, we should think, achieved all that was possible. He is coaxing to the last degree. If, on the other hand, their object is to present only the essential facts of any one science, such as an intelligent, but not previously-prepared, listener would carry away from a course of lectures in which general statements were supported by every necessary detail, then again we think Mr. Mahaffy has done well, better perhaps in those branches of the subject which we do not profess to have followed than in some others where we are more familiar. For example, it is very doubtful whether he is not training up the young in a way which may lead to mischief when he tells them (p. 21) that Greek temples were imitations in stone from ordinary wooden buildings. It is quite true that certain of the details in a Doric temple are imitated from a construction in wood, but whether this previous wooden construction was an ordinary building, a temple, tomb, or even a piece of domestic furniture, is a question which remains to be settled. It would be more to the credit of the fertility of the Greeks in adapting whatever they found correct in principle in one thing to other things which, though in the main entirely different, yet somewhere contained the same principle of construction, if we assumed that the wood-like construction of dentals and columns, for instance, had been adapted from an ordinary wooden chair. No one can say positively that Mr. Mahaffy is either right or wrong in the matter. But, at any rate, it is clear that he gives his youthful readers an instance of slavish imitation which must leave an impression entirely at variance with

the character which he otherwise claims for the Greeks.

It must be difficult to deal with the question of Greek dress in the short space available in one of the primers, but that is no reason why a Roman statue of Sophocles dressed in the *toga* as worn frequently in Rome should have been chosen to illustrate (fig. 5) the Greek *himation*, numerous examples of which could have been obtained from Greek sources—say, the frieze of the Parthenon. We doubt whether an inexperienced reader would be the wiser from the following sentence: “The *ιμάτιον* was also doubled when men were actively employed, and fastened on the shoulder with a clasp or pin;” or from the explanation of it in the next sentence: “This was done in imitation of the smaller but thicker cloaks (*χλαῖνα*, *χλαμύς*), some of which were of semicircular shape, and borrowed from Macedonia.” All would be clear in the end if the reader knew what the *chlamys* was like; but that is just what Mr. Mahaffy ought to have told him. His epithet of “semicircular” is far from conclusive, while “borrowed from Macedonia” starts a train of conjectures which go to increase the difficulty. Again, on p. 47, he gives an engraving from a “female figure (caryatid) in the long *χίτων*, and over it the Doric *πέπλος*.” We quite agree to the *chiton*, but if this is a Doric *peplos* which this statue wears hanging from the shoulders down the back, then a difficulty which has long troubled archaeologists is set at rest. The fact, however, is that the statue wears only one garment, and that is a *chiton*, with the top doubled back to form a *diplōidion*. The appearance as of a mantle hanging from the shoulders behind is produced by a large fold which is made on each shoulder and held together by a brooch. The statue is in the British Museum; it is known to be Roman work, and, in comparison with the beautiful caryatid from the Erechtheum, has no claim to figure as an illustration of Greek dress. Apart from this figure the *peplos* is a garment about which there is, perhaps, less unanimity than about any other article of Greek dress.

In the list of games played by children we miss “knuckle-bones” (*astragalismos*), the more so since of all youthful games it is the one which stands out most among the artistic remains of the Greeks. Among domestic animals cats are said to have been common (p. 59), but we were under the impression that this had not been proved. The lodging-house cat we can readily admit. As regards weights and coinage, we do not find the statements satisfactory. The subject is certainly obscure and difficult; but it would have been simple enough to have told the reader what the Aeginetan and Euboic standards were. We miss in his account of legal procedure any mention of the court of the Areopagus, and, indeed, very little is said about cases of bloodshed or murder compared with the details of civil cases.

It can scarcely be possible to write briefly and freshly about the life of the old Greeks without a special study of their industrial and artistic, as well as their literary, remains. There is too little evidence of such

special study in Mr. Mahaffy's *Primer*; but that is a fault which can be remedied easily if he has the will to do it, and it has been from the conviction that he is so minded that we have taken a pleasure in pointing out what seemed to be shortcomings, instead of detailing them disappointedly as if there were no hope of the author thinking better about them.

A. S. MURRAY.

The Game of Lawn Tennis (with the Authorised Laws) and Badminton. By "Cavendish," Author of "The Laws and Principles of Whist," &c. (London: De La Rue & Co., 1876.)

THE increasing popularity of the revived game of out-door tennis has been attested, firstly, by the publication of rules by the Marylebone Cricket Club, and, secondly, by the appearance of this little manual, which embodies the rules of the M. C. C., with the addition of explanations and hints intended to enable its readers to play the game without oral instruction.

The M. C. C. have doubtless done good service to the game in giving it a recognised position by the publication of its rules under the stamp of their high authority. But it need not be supposed that they meant these to be final, but rather that they wished to supply tangible material for comment and suggestion. The laws of tennis proper, like the British Constitution, or the principles of morality, were not made, but grew; *κὺς αἰς οἶδεν ἐξ ὅρου φάνη*. The laws of out-door tennis also will grow, however often they may be made.

At present there seem to be two points which especially demand reconsideration—the method of scoring and the shape of the court.

As to the scoring, many players have already discarded the game of fifteen aces with its "hand-in" and "hand-out," which, in a double game especially, are so fruitful of confusion, and have returned to the four-stroke game of tennis proper, and the "set" of the best of eleven games. Each side serves alternate games, retaining the service during the whole of a game. It may surely be supposed that the eminent tennis-players who are credited with the formation of the M. C. C. rules would personally have preferred this plan, and that when they borrowed the "innings" arrangement from racquets, it was "because of the hardness of heart" of the public whom they addressed, to whom they thought the phraseology of racquets would be less unfamiliar than that of tennis. If the historic scoring, "15, 30, 40," be objected to as meaningless where there are no chases, "1, 2, 3" would do equally well. "Deuce" and "Vantage" have already been adopted in the published rules.

As to the shape of the court, the M. C. C. have appended a note to their description, which says that "its dimensions are not laid down arbitrarily." At Lord's, however, the court is two yards narrower at the net than at the extremities. This departure from the rectangular shape of a walled tennis-court has been almost universally adopted in the open-air game, but it is difficult to see any reason for not regretting it.

Again, the net at Lord's is given as 5 ft. high at the posts and 4 ft. at its middle point. But surely a height of 4 ft. 6 in. at the posts and 3 ft. 6 in. at the middle is by no means lower than is needed to encourage a just severity of stroke. And something to this effect is said by "Cavendish" in his Manual.

The "Hints" in this Manual will be of considerable use to the beginner. The only part which I see reason to question is that which concerns the manner of holding the racquet. Probably the author would hardly wish it to be understood that no prehensile force is to be exerted by the thumb and forefinger: yet this would, I think, generally be gathered from his words.

Shuttle-cock tennis was probably played in some form or other in many private houses long before it received the meaningless or misleading name of "Badminton," but if we go back two centuries or so we find it played also sometimes in tennis-courts; so that this, as well as the ball-out-door-game, is a revival, not an invention.

Unquestionably these revivals (that of the ball-game of course incomparably the most) have been an important addition to modern forms of exercise and amusement. Out-door tennis can never be so perfect a game as tennis proper, but its conditions allow of its being infinitely more popular. The Genius of Tennis has come forth from his high-walled sanctuary, and dwells familiarly with men in the simple habit of a greensward game. And those who find the out-door game too rude and too monotonous may at least derive satisfaction from the prospect that this popularisation of the outlines of tennis may excite aspirations to ascend from its lower to its higher forms—aspirations which may perhaps lead ultimately to the increase of the now lamentably small number of tennis-courts in the world. But it will generally be held that the out-door game is praiseworthy for its own sake also. There are many lovers of muscular exercise who find walking too dull, riding too costly, cricket too lengthy, football too violent, field-sports too costly or too distant; some too there may be who are fantastic enough to prefer

"Never to blend their triumph or their joy

With anguish of the meanest thing that feels."

To all these the revival of out-door tennis is a valuable boon. ERNEST MYERS.

The Dead Cities of the Zuyder Zee. From the French of Henry Havard. By Annie Wood. (London: R. Bentley & Son, 1875.)

THE coasts of the Zuyder Zee are but little visited by travellers, and these Cities of the Dead, which M. Havard describes with the pen of a historian and the pencil of an artist, are little known, even by name. Who has heard of Monnikendam, Enkhuisen, and Hoorn, of Medemblik and Stavoren? Yet these towns were formerly the emporium of the trade of the north, and afford a striking example of how the centres of commercial prosperity are transferred from one part of the globe to the other.

M. Havard chartered for his voyage a boat called a Tjalk, drawing only three feet

of water, the captain stipulating that he should not put to sea in bad weather and that he should not work on a Sunday. The boat was duly provisioned, as only bread, fruit, and vegetables could be procured on the voyage; a fresh supply of water was also requisite, as the brackish water of the shores is frequently prejudicial to strangers. The first place at which they touched was the island of Marken, the houses of the village being built on seven mounds, while the eighth is assigned for the graveyard. In winter, when the sea has invaded the meadows, the fishing population pass in boats from one hillock to another. The women preserve an extraordinary costume, transmitted from generation to generation; an immense white mitre-shaped cap, and a kind of stomacher profusely embroidered in red and pink. The houses are painted green outside and blue within, with deep, red-tiled roofs. The walls are hung with Delph plates, mostly blue; the Dutch, as our author says, in faience and in porcelain are "vousés au culte du bleu." One Madam Klok has such a wonderful collection of Delph faience, Japanese porcelain, and Dutch carvings that the Queen of the Netherlands visited the island for the express purpose of seeing them.

First among the Dead Cities comes Monnikendam, whose ships took part in the famous sea-fight of the Zuyder Zee in 1573, when the Spanish fleet was totally destroyed and the admiral, Count de Bossu, taken prisoner. As a memorial of the victory Monnikendam received the Admiral's collar of the Golden Fleece, while Enkhuisen had his sword and Hoorn his golden goblet.

"But now," says M. Havard, "the streets are deserted, the squares empty, the canals stagnant. The trees and houses inclining towards the canal reflected themselves in the sleeping waters, and appeared to join in their slumber. The inhabitants themselves did not destroy this majestic calm. Old people and young seemed plunged in a half somnolency, and appeared to be economising life, and depriving themselves of animation for fear of it passing away too quickly. After witnessing this repose bordering on death, this mummy-like tranquillity, one could scarcely believe that Monnikendam was considered one of the twenty-nine great towns of Holland when the Hague was but a village, and at that period enjoyed privileges which were not then granted to the seat of government."

Edam, whose red-rind cheeses are of world-wide celebrity, which has the largest and finest church in North Holland, with painted glass windows of Gouda, the present of the principal towns of Holland, has now a population of 5,000, whereas she formerly counted more than 25,000. She took the ninth rank among the Dutch towns, and sent a deputy to the States-General. Her shipping was most extensive, and she enjoyed the greatest commercial prosperity. In the Stadhuis hangs the portrait of a ship-owner of the seventeenth century, represented as pointing to ninety-two ships which he possessed in the Zuyder Zee and the North Sea.

Hoorn is a picturesque town of the seventeenth century; the houses are covered with quaint carvings and bas-reliefs. Its streets now are deserted and grass-grown.

"Yet Hoorn was formerly filled by an active

population, covering the seas with its fleets and the Indies with its factories. Every week a thousand wagons entered its market, laden with mountains of cheese; and each year its bullock fair, established in 1389, drew from every corner of Europe a multitude of foreigners. French, Dutch, Frisians, Germans, and Swedes flocked within its walls and increased its astonishing prosperity. At this period Hoorn counted twenty-five thousand inhabitants. It scarcely now contains one thousand."

When Van Tromp, with broom at the mast-head, sailed up the Thames, his squadron was composed of a certain number of ships from Hoorn, who brought back trophies of their feat. This city is perhaps better known by its giving its name to the southern point of the American continent, discovered by Cornelius zoon Schouten. Tasman, the discoverer of Van Dieman's Land and New Zealand, and Jan Koen, who founded Batavia, were also natives of this city.

Enkhuysen, country of Paul Potter, where more than 60,000 inhabitants contributed to the prosperity of Holland, now barely contains 5,000 souls. This port, which equipped a thousand ships, scarcely reckons a sail; and its silent, deserted streets are "a world too wide" for the passers-by who traverse them.

"But more heartrending still, when we had arrived at what appeared the last house of the town, we saw far in the country a gate of the city. A hundred years ago the houses were continued close up to this gate. It now took a twenty minutes' walk across the meadows to reach it; and this picturesque edifice, no longer of use, stands a solitary, isolated monument of past ages, the very walls which supported it having yielded to the pickaxe and the devastating influence of time."

Yet this port, now so unimportant, saw, in 1390, Albert Count of Holland embark his army in 3,000 flat-bottomed vessels to carry them to Friesland. The town possessed large fleets annually increased from its own dockyards, the herring fishery was, and is still, a great source of wealth, and its brave sailors acquired such renown that Charles V. and Philip II. would have no others in their royal ships. In the seventeenth century its commerce declined, its houses became deserted, and grass invaded its quays.

If Enkhuysen is now one vast cemetery, Medemblik is a tomb. Human life has quitted it, and the houses will soon follow its inhabitants. Yet its port was one of the largest in the Zuyder Zee, and when Enkhuysen and Hoorn were not yet in existence, Medemblik had palaces and armies, was the ancient capital of the kings of Friesland, and the residence of the famous pagan king Radbrok, whom Pepin and Charles Martel converted at the point of the lance, but who withdrew his foot from the baptismal font when told that his heathen ancestors were not in Paradise. Medemblik shared with Hoorn and Enkhuysen the privilege of a mint.

M. Havard extended his journey to Nieuwe Deep and the Helder, the Gibraltar of the North, and returned by Harlingen, now the great port of Friesland, and Leenwarden, its present capital. He next went to Hindeloopen, formerly the centre of the great forests submerged by the Zuyder Zee, whose inhabitants, enriched by agriculture,

embarked their capital in maritime speculations. This little town has its special costume, its special architecture, and a special language only spoken within its walls. The painted and carved wood furniture has a strong Oriental character, palmiettes and interlacings, in colours of violent contrast, red upon blue, heightened occasionally with gold.

Stavoren, last of the Dead Cities, was celebrated for three centuries before the Christian era for its riches and large population. It borrowed from Rome its theatre and its circus, and at a period when the Zuyder Zee was not in existence, Richolde built a splendid palace in which, to use the hyperbolic language of the chronicler, the vestibules were gilded and the columns of massive gold. Here he assembled all the nobles of Friesland, and the Duke of Brabant repaired to his court with a knightly train to admire his magnificence. Stavoren was not only a royal but also a commercial and industrial city. It provisioned the south with the productions of the north, and spread over the north the riches of the south. Its intrepid mariners passed the Sound, obtained the privilege of exemption from the dues on entering Dantzic, and made treaties with the Kings of Scotland and Sweden. Stavoren was one of the first cities which formed the Hanseatic league, and held the third rank among its towns. In 1335 it declared war against Lübeck and Hamburg, and ten years later repelled the invasion of William IV., Count of Holland. It is to this period that is assigned the well-known legend of the Widow of Stavoren, as related by Guicciardini.

F. BURY PALLISER.

English History in the Fourteenth Century.

By Charles H. Pearson, late Fellow of Oriel College, Oxford. (London: Rivingtons & Co., 1876.)

THIS is not a continuation, such as we could have wished to see, of Mr. Pearson's valuable work on English Mediaeval history. It is only a new addition to the numerous historical handbooks which are now being compiled and published for the use of schools. And, though it is certainly an advantage to have even a school manual from the pen of one who has devoted so much study and thought to English history, we cannot say that even in this respect it altogether satisfies us. Mr. Pearson, doubtless, writes under great disadvantages now that he has domiciled himself on the opposite side of the globe; and if he had been writing an elaborate history he would have found the task by no means easy. But the present work is neither an elaborate history nor a satisfactory primer; it is too much for the one and too little for the other. It is not strictly confined, as a primer ought to be, to those broad general facts which, being established beyond the reach of controversy, do not require to be guaranteed by a reference to special authorities; and yet there is not a single authority cited by which the reader might be enabled to judge for himself whether Mr. Pearson has interpreted the facts aright.

Moreover, we must confess our disappoint-

ment in another thing. Mr. Pearson has chosen to write a book about the fourteenth century; so far well. But, if it is important to teach history at all, some sense of the unity of history ought to be imparted even in manuals devoted to a particular period; and the almost total silence of the author about one of the greatest of England's kings, whose reign was mainly in the thirteenth century and only overlapped the commencement of the fourteenth by a very few years, is not justified by the arbitrary division of time which Mr. Pearson has undertaken to illustrate. How are we to understand the fourteenth century itself without the reign of Edward I.? What is there in the character of the succeeding kings, or even in the subsequent history of the people, to reward our study, if we shut out of view that sovereign who, alike in what he did and what he failed to do, laid the foundations of their rule? The troubles of the reign of Edward II., the chivalry of Edward III., the incompetence and tyranny of Richard II., are but sorry subjects of contemplation by themselves—even the best of them. The reign of Edward I. is like the planning, and in part the building-up, of a great empire, which became a reality and a complete thing in after ages. But almost the whole story of the fourteenth century in England is the story of retrogression. Edward II. threw away every advantage that his father had secured for him, and Edward III. only succeeded for a time in drawing off attention from the impending evils by the glitter and the glory of a hazardous foreign war.

Yet, because Edward I. does not greatly belong to the fourteenth century, Mr. Pearson has scarcely a word to say about a king who laid the foundations of order, and he devotes very great attention to the kings who promoted, or were unable to restrain, disorder. He dwells at considerable length on the miserable reign of Edward II., which, we must say, he in vain attempts to render interesting, even in a constitutional point of view. He does not, indeed, do injustice either to the actions or to the character of Edward III.; but he gives almost as prominent a place to the misdeeds of Richard II. If Mr. Pearson shares what seems to be the prevalent impression nowadays, that the acts of kings and heroes have occupied hitherto too large a space in the historian's page, he need not, at least, have shut so completely out of view the best king of the period, merely because his reign belongs chiefly, not to the fourteenth century, but to the thirteenth.

Yet Mr. Pearson does indulge in a little retrospect. He is tempted to bestow some thought on the thirteenth century, not to exhibit the policy of a great king, nor even the condition of the English people, but to examine the state of Scotland in those times. Is Scotland, then, of more importance than England and her kings in a volume devoted to *English History in the Fourteenth Century*? We are far from saying that the place occupied by Scotland in an English History, and especially for this period, ought to be an insignificant one; but surely it is not exactly fair and reasonable treatment to take out the mainspring of an English watch, and

exhibit by its side a piece of Scottish mechanism in perfect working order. The history of Scotland, it is true, at this period especially, exhibits much that is heroic, much that is romantic, much that appeals to the best sympathies of every one. More especially have later ages come to appreciate that sturdy Scottish independence which, without being even much imbued by the prevailing chivalry of the times, preserved the northern kingdom from subjugation, and vindicated against mere feudal domination those ties of blood and lineage which the prevailing chivalry ignored. But Scotland might have had its due, and Bruce and Wallace might have been justly honoured, in a History which still admitted that the feudal dependence of Scotland was at least a plausible idea, to which the acts of Scotchmen themselves had given a decided sanction, and that the real merits of the controversy turn upon the manner in which it was enforced on the one side and resisted on the other.

But, after all, this is perhaps mainly a question as to choice of subjects. Mr. Pearson has great sympathy with the Scottish struggle for independence—and for the English also. He has not great sympathy with kingly government, even in the case of a king like Edward I., and his sympathy with the Scottish cause is really increased—though, perhaps, he does not know it—by his sense of the influence of the Scotch war in weakening the English throne. His constitutional theories are altogether on the side of popular government, and how far they will bear the test of a strict examination of authorities we are by no means sure. In some places it seems to us that his view differs very materially from that of Prof. Stubbs, and that generally he assigns an authority to the Parliament which the latter attributes only to the Council. But, whether his views on such subjects be right or wrong, even an essay by Mr. Pearson under the guise of an historical manual has its value. His large reading, not on one period merely of English history, and his practical work in the business of education when he was in England, have certainly qualified him to tell us something worth listening to on the subject of his book; and we trust it will be read, as it ought to be, not with a careless acceptance of all its statements, but thoughtfully and judiciously, as the work of a thoughtful man and an earnest student.

JAMES GAIRDNER.

NEW NOVELS.

Gabriel Conroy. By Bret Hart. (London: Warne & Co., 1876.)

Jabez Ebsleigh, M.P. By Mrs. Eiloart. (London: Samuel Tinsley, 1876.)

The Clew Bend. By Dephias. (London: Samuel Tinsley, 1876.)

Gabriel Conroy is so good that Mr. Hart should have taken pains to make it better. It is his first effort *de longue haleine*, and demonstrates the fact that at present he is only to be trusted over a short distance. His sketches of Californian life were admirable, full of humour which was rarely over-strained, and written in a style almost

as free as that of Hawthorne from the ordinary and unpleasant twang of American novelists. In *Gabriel Conroy* Mr. Hart has again described the sort of life which he knows best, and has again introduced his large, stupid, worthy, and unselfish miner, his fascinating gambler, his terribly precocious child, and his women who, though little better than the wicked, are good at heart. But the size of his canvas seems to demand an innumerable multitude of figures, and these are often sketchily drawn, if they can be said to be drawn at all. The plot is always falling to pieces, as if it had outgrown its strength, and recovering itself by a spasmodic jerk. On the whole, the story is a series of efforts, in which amusing or touching scenes are presented with admirable effect, in the midst of languid pages over which the attention falls asleep. Nothing could be fresher and more powerful than the opening scenes of desolation and famine which beset a party of emigrants. But the chief characters pass out of view, and the rest of the tale is an impossible game of hide-and-seek, in which Gabriel and his sister Grace, her lover, Arthur Poinsett or Philip Ashley, and their friends and foes, appear in all manner of disguises, and act without an apparent motive. This does not sound an attractive description, and yet the humour is so delightful, the casual sketches—as in the chapter called the “Bulls of the Blessed Trinity”—so fresh and vivid, the satire of San Franciscan society, with its eternal brag about the climate, and its struggle with fogs and earthquakes, so amusing, that *Gabriel Conroy* is far better worth reading than most well-constructed and sedate romances. Colonel Starbottle alone would redeem a worse story, and Jack Hamlin—whose ideal it was “to become the possessor of a large organ, and to introduce it gradually, educating the public taste, as a special feature of a first-class gambling saloon”—is an old friend whom one is glad to meet again. We must find room for a quotation which may be recommended to the notice of moral firts like Mr. Daniel Deronda:—

“Thar’s one way ez is pretty sure to fetch women allers. That is to play off indifferent—to never let on ye like ‘em. To kinder look arter them in a ginal sort o’ way, as Gabe looks arter the sick! but not to say anything particler. . . . That kind o’ thing is pretty sure to fetch almost enny woman, and a man ez does it orter be looked arter. It’s tamperin’, don’t ye see, with the holiest affections. Such a man orter be spotted wherever found.”

A great deal of *Gabriel Conroy* will bear being read more than once, by a robust student who once makes his way through the jungle of complications which do duty for a plot.

Mrs. Eiloart is to be congratulated on having made in *Jabez Ebsleigh, M.P.*, a considerable advance on many of her earlier works. The hero, a journalist and Working Man’s Member, from whom the book takes its name, is put before us with a few clear touches, and impresses us with his personality. His wife, Lucy, who unscrupulously pushes him up in society, and down in the scale of moral beings, is also cleverly sketched, though it is doubtful to

any one acquainted with the habits of journalists whether her final and ruinous blunder could have taken place in the manner described. We will not spoil the story by relating the plot, though perhaps the plot is its weakest point, having to do with a phase of life with which ladies are not usually familiar. The book deals with characters of every type and of every class, and with one exception they are all living beings. This exception is, naturally, Bernard Rushworth, who is intended to be the most interesting person in the book, but who only leaves behind the impression of embodied virtue. In contrast to him his aunt, Lady Elizabeth Talwynne, stands out in strong relief; and Mrs. Eiloart has succeeded well in painting the gentle, old-fashioned, and uncompromising conservatism of ladies who were in their prime fifty years ago. The book becomes less interesting when it deals with “high life” and the dissipations of the London season, and we are glad to plunge again into the small politics of the town of Arkleigh, which Jabez represented in Parliament.

In spite of a long and severe apprenticeship to the purposeless eccentricities of the heroes and heroines of modern fiction, any reader with sufficient time or patience to struggle through the *Clew Bend* must receive a shock at the hopeless folly of all the characters. The good hero, one Godfrey Bennimore, the owner of a fine estate, goes to travel for some years, having on the previous day been married secretly to the niece of the neighbouring squire. This young lady thinks it necessary to bury herself under a feigned name in the country during her husband’s absence, but no obvious or adequate motive is anywhere assigned for this extraordinary conduct. The book, short as it is—brevity is its only merit—contains breaches of most of the Ten Commandments, and for humour it has the usual vulgar widow, whose flirtations are described at a length and in a way which renders them too distasteful for quotation. It has seldom been our lot to read anything so intolerably silly as the *Clew Bend*. A. LANG.

CURRENT LITERATURE.

Old Words with Modern Meanings. Edited by T. Whitcombe Greene, B.C.L. (Longmans.) This is a work of a similar character to Trench’s *Select Glossary*, and contains a certain number of words of which the senses have, in course of time, been modified, with quotations from various authors exemplifying their use. In the absence of a complete English dictionary such as the Philological Society has proposed at some indefinite date to give us, all such works have their value. Unfortunately, the present examples were collected by a lady now no longer living, who omitted to add the references in a great many instances. It is a pity Mr. Greene did not add these where he could, as might have been done without much labour in many instances. It cannot be too strongly impressed on the minds of word-collectors that it is the reference which gives the quotation its value. The word itself may be misspelt, the definition may be wrong, the examples misquoted, and yet all these things would matter but little if only the reference be full and complete. It is the great defect of *Webster’s Dictionary*, otherwise so excellent, that it avoids giving any but the vaguest references. It :

Richardson's great merit that, while his etymologies are mostly wrong, we can forgive him all when we look at his references. In the present volume, for example, we find, under *gruff*, the quotation: "And *gruff* he fell adown unto the ground.—Chaucer." We are not told in what edition of Chaucer we are to find this line, nor in what edition we are to find the spelling *gruff*. The reference is, probably, to the last stanza but three of "The Prioresses Tale": "And *groffe* he fell al platte upon the ground," Chaucer, *Cant. Tales*, ed. Tyrwhitt, 13605. When it is remembered that any student moderately acquainted with English literature could have supplied more than half the references in a fortnight, it is much to be regretted that the editor did not take this trouble. It is labour that ought not to be thrown upon the reader, who may, presumably, be a tyro, and helpless as to finding his place without some guidance. It is all the harder because the book is well printed, and altogether a neat and handy volume, and, even as it is, is of value and interest.

Barry Cornwall and his Friends. By James T. Fields. (Boston: Osgood.) We do not know how an hour could be more pleasantly spent than in reading this exquisite little book, in which the last survivor of the great days of modern song is brought before us, a ghost himself, surrounded by the still more shadowy figures of his contemporaries. Mr. Fields lets us hear Mr. Proctor converse of Lamb, Coleridge, and Keats; praise Browning when to do so was to assert an eccentric originality of opinion; introduce his young American guest to Landor, to Kenyon, and to Rogers; and point out his own poet-daughter Adelaide, still unprepared for fame, sitting over a book in a corner of the library. We meet the genial figure of Mrs. Jameson; Forster self-assertive and thunderous; the household faces of Thackeray and Dickens, Leigh Hunt and Leslie, each portrayed with the gentle enthusiasm of an old man whose memories reproduce the ardours of his youth. Among the oft-told tales of Rogers' breakfast-table, this, perhaps, is repeated for the first time:—

"Samuel Lawrence had lately painted in oils a portrait of Rogers, and we asked to see it; so Edmund was sent upstairs to get it, and bring it to the table. Rogers himself wished to compare it with his own face, and had a looking-glass held before him. We sat by in silence as he regarded the picture attentively, and waited for his criticism. Soon he burst out with 'Is my nose so d—y sharp as this?' We all exclaimed 'No! no! the artist is at fault there, sir.' 'I thought so,' he cried; 'he has painted the face of a dead man, d—n him!' Some one said 'The portrait is too hard.' 'I won't be painted as a hard man,' rejoined Rogers. 'I am not a hard man, am I, Proctor?' asked the old poet. Proctor deprecated with energy such an idea as that. Looking at the portrait again, Rogers said, with great feeling, 'Children would run away from that face, and they never ran away from me!' Notwithstanding all he had to say against the portrait, I thought it a wonderful likeness, and a painting of great value."

At the end are subjoined various graceful and lively letters from Barry Cornwall to the author, and one hitherto unpublished piece of verbal grotesque by Charles Lamb. The only word of blame that the unkindest criticism could breathe against this book is, that its outward appearance reminds one irresistibly of those dreary little volumes given as Sunday-School prizes to the infant poor.

A Study of Hawthorne. By George Parsons Lathrop. (Boston: Osgood.) In this little volume a young American poet gives a very exhaustive sketch of the life and works of an author for whom, in his boundless admiration, he does not claim any honours less than the highest, and whose name he does not hesitate to couple with Shakspeare's. Considering the want of a sense of proportion which is implied by this initial assumption, it is really remarkable that his study when it is analytic, not comparative, should be as

acute and critical as it is. The relative position and value of Hawthorne's successive works; the nature of their apparent and essential contents; the complex action of external influences on the novelist's mind—all these things are judged with a nice precision that leaves very little to be desired. The deepest students of Hawthorne are not likely to quarrel with Mr. Lathrop when he asserts that the "Marble Faun" is the supreme effort of its author's imagination, the most subtle, the most ingenious, the most penetrative of his astonishing romances. It seems that Hawthorne was exceedingly unwilling that his biography should be written, and Mr. Lathrop is far too pious to outrage a single wish of his idol. He most carefully warns us that this volume is not a Life of Hawthorne, but we may assure our readers that, for all but those for whom the essence of biography is impertinent and scandalous tittle-tattle, this book will be found a sufficient and excellent biography, in spite of its author's disclaimer. Several of the points in which the conduct of Hawthorne was made the subject of unfriendly criticism are here fully cleared up. The matter of Mr. Pierce's biography, followed, as it immediately was, by the reward of the best place in the new president's gift, is still somewhat puzzling, but more so, perhaps, on account of dissimilarity of national custom than on any recognised code of public morality. With the one reservation at which we have already hinted, we are able conscientiously to recommend this book as the finest tribute yet laid at the shrine of the first of American writers. The style is limpid and pleasing, and interpenetrated by a tone of vaporous reverie which is quite in keeping with the theme.

Poets and Novelists; a Series of Literary Studies. By George Barnett Smith. (Smith, Elder and Co.) Mr. Barnett Smith introduces his essays with some very old-fashioned pretexts for publication. We have heard before of magazine-writers who never would have collected their scattered papers if they had not "been repeatedly pressed to do so by numerous individuals," and who timidly but ingeniously "trust that the public and the press will endorse their verdict." It is with a somewhat bolder flight of the imagination that the author claims "the permanent value" of "exhaustiveness" for his studies. We do not approve of these little artifices, these coaxing hints to irresponsible reviewers, these innocent suggestions of what epithets the author would like, what view of his writing is taken by his distinguished friends. If the truth must be said, we find these essays anything but "exhaustive;" they are painstaking, conscientious *résumés* of what other men have written and said about the several persons under review. As criticism they are about on a level with the aesthetic utterances of the *Times*, and they aim, as those do, at a rapid and rounded sketch of the principal facts of a writer's career, and the view taken of his works by ordinary educated persons. They sail very close to the wind; no startling paradoxes, no bold theories, no unexpected deductions will be found in these eminently respectable pages. There is a quite curious dearth of originality, and a great shrinking from the expression of any opinion not in accordance with the feeling of the majority. It is exactly the sort of book one might imagine an average member of Parliament writing to keep his hand in in the winter evenings; especially in such more impassioned passages as this:—

"The emerald beauty of a thousand valleys, embroidered by the silver threads of meandering rivers; the grandeur of the everlasting hills with their lofty and majestic calm; the terrible rolling of the restless and unsatisfied sea; . . . these were the sources of the eminent inspiration"

of Mrs. Browning. We like Mr. Barnett Smith best when he writes on Peacock. His essay, as it was the first, remains in all probability the best on this author, now so much admired, so long doomed to undeserved oblivion. There are too many in-

stances of bad English in Mr. Barnett Smith's writing, and they are unusually apparent in so level and commonplace a style as his. "Several of the situations in the poem, which would have been rejected by other living poets, of sufficient standing capable of writing it, as vulgar," and "making people feel the events it describes as he never felt them before, but it does not make them feel in precisely the same way as they ought to feel," are instances taken almost at random to justify our charge.

M. VAN LAUN'S *Molière* has now made such progress that it is probably vain to hope for much improvement in its style, and certainly useless to comment on its defects in that respect. Yet one cannot help wincing when one of the gracious heroines of that charming trifle *Melicerte* is made to say that her beloved is "after" another damsel. The chief things in this (fourth) volume are *Tartuffe* and *Amphitryon*. The former is very carefully and, on the whole, creditably done; but perhaps its perusal shows us more clearly than anything else the enormous difficulties besetting a literal prose translation of this kind. In commenting on *Amphitryon* M. Van Laun has, we think, fallen into the mistake of putting down to the credit of the French dramatist debts which he and Dryden incurred in common to Plautus. If we set aside its unlucky coarseness, the English play will compare very favourably with the French. The introduction of Judge Gripus, a really comic character, among the dummy confidants of *Amphitryon* was a happy thought, and the separation of the parts of the *soubrette* and Sosia's wife was a still happier. M. Van Laun's way of alluding to this last change is odd: he merely says that Cleanthis is in one scene "called" Bromia, and in another "called" Phædra.

THE author of *The Gentleman's Art of Dressing with Economy* (Warne) may be safely recommended to all who are gifted with a laudable ambition and afflicted with an unlucky ignorance as to this matter. He is, on the whole, undoubtedly sound. He protests against dickeys, paper collars, loud patterns, and mock jewellery. He does not much love white hats. He strongly recommends plain black ties. He abominates pomatum, and forbids his pages to a man who does not "tub." His decisions on these all-important points we may (therein reversing Mr. Carlyle's practice under similar circumstances) modestly but firmly ratify. On the other hand, we have but few omissions to notice. He is too lax as to gloves—and he might have put in a word of warning against the infatuated practice of combining a "pot" hat with a frock coat. Whether a gentleman needs to be told, and whether it is any use to tell a not-gentleman, how to dress, are metaphysical points which may be left out of consideration. But we do wish that the taste of the benevolent person who wrote this book were as correct as to the dress of thoughts as it is as to the dress of bodies. Why should corns be called "pedal callosities"? Why should *Punch* be spoken of as "our facetious old friend"? The author very properly answers YES in large capitals to the question "Is it necessary to be so particular as to one's dress?" Will he allow us to give the same answer to the question "Is it necessary to be so particular as to one's style?"

W. S., who has prefaced his *Bosh* (Bickers and Son) with some apologetic lines addressed to Mr. Lear, has apparently a remarkable enmity to the episcopal order. Three out of his twenty-one nonsense verses are devoted to mythical occupants of the sees of York, Norwich, and Bangor, prelates of gluttonous and intemperate habits; a proportion which suggests the idea that if all the rest had been similarly allotted to the other English sees, it would have been less invidious, and the book would have gained in unity. We cannot greatly commend the production as a whole. The verses are scarcely above those which lively

undergraduates are wont to inscribe in the visitors' books of inns; and in his illustrations the author, forgetting that the few bold strokes were the great charm of the earlier work of this kind, has produced an effect at once splashy and giggling. The "old ladies of Wrexham," on p. 12, are perhaps the best.

There and Back, a seaside book of selections from *Judy*, is not unworthy to take place among its fellows—an equivocal compliment, perhaps, considering that the ultimate fate of those fellows is usually to be left on the cushion of a railway carriage, or the steps of a bathing-machine. The designers of many of the illustrations appear to have forgotten that mere ugliness and distortion are not in themselves comic—a fault too frequently met with in the cheaper illustrated papers. But some of the "pictorial pleasantries" are capital: for instance, the admirable "old bird," who refuses to "ride alone with a lady," on p. 17, and the wicked truant husband who is "bowled out," at p. 108. Mr. C. H. Ross, who has undertaken the somewhat depressing task of composing odd bits of letterpress to fill up the gaps between the illustrations, has done his work well considering the difficulties. There are, however, two occasional notes on passages in *Roderick Random* which strike one as odd, not to say inappropriate.

The St. James' Lectures for 1875. Edited by the Rev. J. E. Kempe. (Murray.) These lectures on devotional classics are very unequal, but the method is the same in all. The writers pick out and emphasise what they can recommend as edifying in the *De Imitatione Christi*, Pascal's *Thoughts*, St. Francis of Sales' *Introduction to the Devout Life*, St. Augustine's *Confessions*, Baxter's *Saints' Rest*, and Jeremy Taylor's *Holy Living and Dying*, with a preface about the personality of the writer, and generally an attempt to make some capital out of him in order to discredit Romanism and sacerdotalism. Of course this is not favourable to disinterested appreciation of any spiritual classic, which, like other classics, is best understood when it is looked at simply from every point by an observer willing to take it for what it is, not for what he fancies he can get out of it. The best of the six for simplicity and frankness and the absence of *arrière pensée* is Archbishop Trench's lecture on Baxter, and for a more thorough, if more one-sided exposition, Dean Church's lecture on Pascal comes next. The most unsatisfactory, from every point of view, is Dr. Farrar's on the *Imitation*. To begin with, the theory which makes Gerson the author is more than doubtful, but it lends itself to a great many dramatic contrasts, and Dr. Farrar gives way to temptation and treats the theory as practically certain. Then the doctrine of the book is expounded in a way which shows simple ignorance of the conditions under which we live in a world where nothing is to be had without paying its price. Dr. Farrar has, of course, a right to believe that to concentrate all the powers of the mind upon self-renunciation is only another form of selfishness, and, as such, objectionable; if so he ought simply to have put the *Imitation* aside as a pernicious book, fascinating perhaps to some morbid temperaments. But when he elected to recommend the book as a "companion to the devout life," he should have remembered that the inward depth and peace which he praises are exactly the result of the refusal to be eager and excited about outward things, even about plans for benefiting others, which he condemns: he should have remembered, too, that the author he is condemning for selfishness knew that no pious practice was too important to be laid aside on occasion, *fraternas utilitatis causa*. The Dean of Norwich falls into nearly the same mistake when he censures St. Francis de Sales for fostering quietism. If we are to follow inward peace seriously and practise "meekness towards ourselves," we must do without preferences and plans and ambitions, and in fact, bring our

wishes down to a minimum. Of course, most of the activity of common-place people comes of their trying to keep their wishes at a maximum, but then common-place people know that inward peace is not for them: quietism is only a heresy when it bids us do nothing as well as wish nothing.

MR. NEIL'S edition of *Macbeth*—one of "Collins' School and College Classics"—consists of a six-barrelled Introduction, Text, Notes, "Questions for Examination," and a "Genealogy of the Reigning Royal Family from the 'Gracious Duncan.'" There are some good points in the Introduction—e.g., the quotation from *Albion's England*. For the notes, it would be well if Mr. Neil would either not quote Latin at all, or quote it correctly. Such blunders as "fronte nulla fides," "gemitusque expressit pectore lucto," catch one's eye as one turns over his pages. He speaks of "Hyr-cana," of "the Persian" of Aeschylus, &c. We do not think he is right in paraphrasing "Tis better thee without than he within." "Disagreeable as is thy presence at the door, 'tis better to have an assassin there than Banquo in this hall;" for consider the context:—

"Macb. There's blood upon thy face.

Mur. 'Tis Banquo's then.

Macb. 'Tis better thee without than he within."

As to "screw your courage to the sticking place," Mr. Neil's note is: "sticking place—fixed point, with a covert allusion to the death-dealing spot chosen by the butcher. So in the *Gorgious Gallery of Gallant Inventors*, 1578:—

"Which flowre out of my hande shall never passe,
But in my harte shall have a sticking place;"

where Mr. Neil's discovery of the butcher allusion reminds one of the old commentator's on "shapes our ends" and "rough-hew." The so in his note is surely misleading.

Principles of Plutology. By Wordsworth Donisthorpe. (Williams and Norgate.) In the first chapter the author of this book describes its object as follows: "This first chapter is simply an attempt to demonstrate the futility and barrenness of political economy in its very essence, and the remainder of the work will be devoted to the establishment, on a philosophic basis, of a true science of plutology." After so grand an announcement, it is disappointing to find that the book really makes no attempt to construct the promised science; that it is merely a collection of articles for which the author (p. 169) "must plead the allowance usually made for articles intended for publication in periodicals, and for political and polemical discussions in general;" and that we must look to a future work for the accomplishment of the author's original purpose. The last words of the present book are: "With the aid of our new definition of capital, and other definitions of terms at present loosely handled, we hope in future papers to build up a systematical, complete, and systematic science of plutology, as distinguished from the political economy still flourishing." Unless the science thus projected is to be something very different from the indications afforded by the present book, we must admit a preference for "the political economy still flourishing." The following is a specimen of the stuff Mr. Donisthorpe seeks to put in its place:—

"In future, therefore, after this scrutiny, we shall find it advisable to dispense with the term 'demand' altogether. Indeed, the word has caused much confusion of thought, and it is a very good riddance. How often are we asked to consider the consequences of an increased demand for a commodity! Now, bearing in mind what demand means, how can we conceive of an increased demand for anything? How can more of an article be effectually demanded than actually exists? The only conceivable meaning to be attached to such an expression is an increased value due to a stimulated desire to possess the article in question. How much better, then, to speak plainly and to talk of a rise of value instead of an increased demand! Surely it is easy enough to affirm that the enhanced value of coal at a certain date was due to its increased desirableness on account of the low tem-

perature, and not to a rise in the values of any of its elements of production. Nothing could be clearer; and the erroneous and absurd notion of an extended area of consumption as a prime cause is at once rendered inconceivable."—*Principles of Plutology*, p. 135. Mr. Donisthorpe is certainly wise in his own conceit, but we can discover no marks of any other wisdom in his book.

NOTES AND NEWS.

WE understand that Capt. Burnaby, whose recent journey to Khiva and interview with the Khan excited so much attention in military and political circles, has in preparation a narrative of his adventures and experiences, which will shortly be published by Messrs. Cassell, Petter, and Galpin under the title of *A Ride to Khiva*.

MR. H. J. SPIRO, Lecturer at the University of Leyden, announces for publication, by subscription, *Extracts from the Talmud*, under the title *Talmudische Auszüge*. The original Hebrew text will be given, with a German version on the opposite page, accompanied by notes and illustrations. A concise but complete Rabbinical glossary will also be given, explaining all difficult words occurring in Rabbinical writings. Subscribers' names are received by Messrs. Trübner and Co., 57 and 59, Ludgate Hill, London.

MESSRS. MACMILLAN are about to publish separately, at six-pence each, a series of little books, each containing two of the lectures recently delivered to Science Teachers at South Kensington, on the invitation of the Science and Art Department. Among them will be those by Captain Abney, R.E., F.R.S., on Photography; by Prof. Stokes, on Light; by Prof. E. Ray Lankester and Mr. Sorby, F.R.S., on the Microscope; by Prof. Williamson, F.R.S., on Metallurgical Processes; by Prof. Burdon Sanderson, F.R.S., and Dr. Lauder Brunton, F.R.S., on Physiological Apparatus; by Prof. Kennedy, C.E., on Kinematic Models; by Dr. W. H. Stone, on Sound and Music; and by Prof. Geikie, F.R.S., Director of the Geological Survey of Scotland, on Field Geology. The lectures have been carefully revised by the authors, and will be illustrated.

MESSRS. WM. COLLINS, SONS, AND CO. have in preparation a text-book on *The Principles of Agriculture*, by Prof. Wrightson, of the College of Agriculture, Cirencester. It is to be specially adapted to the recent syllabus of the Science and Art Department, and will form one of their series of Elementary Science Text-books.

STEPS are being taken for raising a fund for the benefit of Mrs. Henry Kingsley, widow of the late well-known novelist. We regret to learn that any such effort is needed; but, being needed, it should be heartily seconded in the wide area within which Mr. Kingsley and his works were known and liked. Miss Allen, 170 Warwick Street, Eccleston Square, would reply to any enquiries on the subject.

THE Archbishop's Library at Lambeth Palace was closed on the 30th ult. for a period of six weeks.

MR. JOHN RHYS has in preparation a volume of *Lectures on Welsh Philology*, to be published by Messrs. Trübner. The principal contents are:—(I) "The position of the Celtic Languages in the Aryan family of Speech, and the Classification of them among themselves;" (II) "The Welsh Consonants: the Nature and Reason of their Mutations;" (III) "The Welsh Vowels and their Changes explained by Reference to Helmholtz's Analysis of Tone;" (IV) "The Continuity of the Welsh Language and the non-Irish Origin of the Early Inscriptions of Wales and Cornwall;" (V) "The History of the Welsh Alphabet and Orthography;" (VI) "Ogams and Ogmie Monuments;" (VII) "An Attempt to trace Ogmie Writing to its Origin." An Appendix to the work includes a

full list of the Early Inscriptions of Wales and Cornwall.

THE Rev. Daniel Silvan Evans has been for many years trying to bring together the writings of the Welsh poet Evan Evans, better known to his countrymen as Jehan Brydydd Hir, who died in the year 1789. The result of Mr. Silvan Evans's labours is a volume of 311 pages just published by Mr. H. Humphreys at Carnarvon. He thinks he has got hold of nearly all the bard's poetical compositions, but he is of opinion that there must be many more of his letters existing than he has been able to find. It is known that his manuscripts fell into the possession of Paul Panton, of Plas Gwyn, Anglesey, Esq., and that they are in the keeping of his representatives, who, however, refuse to allow them to be examined. The editor complains that they refuse even to acknowledge the receipt of his letters of enquiry; it is feared that the manuscripts are, moreover, fast becoming worthless, if they have not already reached that stage of decay. Mr. Silvan Evans deserves the most sincere thanks of all patriotic Welshmen for what he has done, and we wish him success in finding out the missing works of the bard. The latter, it may be noticed by the way, spent some of his time as an undergraduate at Merton College, Oxford; for the editor finds him in the list of subscribers to Thomas Richards's *Dictionary*, in 1753, entered as "Mr. Evan Jenkin Evan, of Merton College, Oxford."

THE Rev. T. E. Gibson, Priest of Our Lady's Church, Lydiat, has prepared a work on *Lydiat Hall and its Associations*. The first part contains an account of the Feudal and Manorial Lords, &c., drawn chiefly from charters and documents in the Ince-Blundell Collection; and the second part is occupied with a history of Lydiat Abbey, including an account of the persecutions endured by the Lancashire gentry for their adherence to the ancient faith between the dissolution and the settlement of the first Missionary Priest at Lydiat in 1681. The materials for the second part are mainly derived from State Papers copied for the late Bishop Goss.

THE *Bibliographie de la France* announces that the Minister of Public Instruction has decided on the publication of a work which will cover the whole field of Gaulish numismatics. He appeals to librarians, keepers of museums, and owners of private collections, abroad as well as in France, to bring to his knowledge any specimens in their possession which are not to be found in the National Library.

We are glad to hear that the late Mr. Richard Simpson left his MS. of *The School of Shakspeare* complete, before he left England on the journey which ended in his death at Rome last spring. Mr. Simpson saw all but the last three sheets of the first volume of his book through the press. These and the second volume are now in the hands of Mr. W. J. Craig, the New Shakspeare Society's editor of *Cymbeline*, to be seen through the printer's hands; and Messrs. Chatto and Windus will publish the book this autumn. It will contain *The Life and Death of Thomas Stucley*, and the *Play* attached to it; "*Nobody and Somebody*, with the true Chronicle Historie of Elydura, who was fortunately three several times crowned King of England"; *Histrio Mastix*, or the Player Whipt, 1610; "*The Comedy of The Prodigal Son*, in which Despair and Hope are very artificially introduced"; "*A Warning for Faire Women*, containing the Most Tragical and Lamentable Murther of Master George Sanders of London, Merchant, nigh Shooters Hill," &c., 1599; "*Jacke Drum's Entertainment*"; or the *Comedie of Pasquill and Katherine*, 1601; and probably "*The Cobbler's Prophecy*." Mr. Simpson printed separately in his lifetime the *Alarum for London*, 1602.

THE third session of the New Shakspeare Society will be opened on Friday, October 8, by a paper on "The Second and Third Parts of

King Henry VI., and their originals," by Miss Jane Lee, daughter of the Archdeacon of Dublin. The November paper will probably be by Mr. Furnivall: "The Character of Hamlet not entitled to the Admiration often bestowed upon it."

SOME interesting statistics illustrating the extent to which English literature is encouraged abroad, and to which foreign literature is encouraged in this country, may be gleaned from the "Annual Statement of the Trade of the United Kingdom with Foreign Countries and British Possessions in 1875," compiled in the Custom House, and recently printed by command of Parliament. Among the nations not under British rule, it would seem from this return that, as might well be expected, the United States is by far our best customer for printed books, the money value of those exported being estimated at 269,907*l.*; we received in exchange but 17,452*l.* worth. The value of the books sent to the Australian colonies is put down at 302,432*l.* To France our exports are valued at 31,593*l.*; our imports from France at 54,295*l.* For Germany the exports and imports are put down at 18,363*l.* and 32,481*l.* respectively; Holland, 22,035*l.* and 29,067*l.*; Belgium, 13,483*l.* and 16,931*l.* The total value of our exported books is returned at 916,351*l.*; in 1874 the amount reached 904,792*l.*

AMONG the documents selected for publication in the concluding volume of *Facsimiles of Irish National Manuscripts*, prepared at the Ordnance Survey Office, Southampton, is a remarkable letter of Lord Thomas Fitzgerald, now preserved among the Irish State Papers in the Public Record Office. Fitzgerald, the "Silken Lord," was imprisoned in the Tower for rebellion against Henry VIII., and was executed at Tyburn in February, 1537; his name and arms are still to be seen rudely cut in the wall of the Beauchamp Tower. This letter, written from the place of his imprisonment but a few months before his execution, gives a very painful picture of the miseries undergone by State criminals at that time. It is addressed to his servant, John Routh, whom he instructs to procure twenty pounds for him from a friend, "Obryen;" the following are the concluding passages of the letter:—

"I never had eny mony syns I cam In to pryson but a nobull; nor I have had nother hosyn, dublet, nor shoy, nor fryt but on, nor eny othyr garment but a syngyll fryse gowne, for a velue furred wythe bowge, and so I have gone wolward, and barefote and barelegyd, dyverse tymes (when ytt hath not ben very warme) and so I shuld have don styll and now, but that pore prysoners of ther gentylnes hathe sumtyme geve me old hosyn and shoyes and old shyrtys—thys I wryt unto you not as complaynyng on my frynds, but for to shew you the trowthe of my gret nede, that you should be the more dyligent In goyng onto Obryen and In bryngyng me the before-sayd xx li. wherely I myght the soner have here mony to by me clothyng, and also for to amend my sclender comyns and fare, and for othyr necessaryes. I woll you take owte of that you bryng me for your costs and labor. I pray you have me commendyd unto all my lovers and frends, and shew that I am In gude helthe.

BY MR THOMAS FITZ GERALD."

THE following Parliamentary Papers have lately been published:—Return from Universities of Oxford and Cambridge relating to Professors, their Emoluments, number of Lectures delivered, &c. (price 4*d.*); Eighth Report on the Judicial Statistics of Scotland (price 1*s.* 6*d.*); Abstract of Local Taxation Returns (price 2*s.* 1*d.*); Report by Sir B. Robertson respecting his Visit to Haiphong and Hanoi in Tonquin (price 2*d.*); Return of Cases of Extradition of Prisoners under Treaty between Great Britain and the United States (price 1*d.*); Papers relating to H.M. Possessions in West Africa (price 1*s.* 5*d.*); Continuation of ditto, with Maps (price 6*s.*); Reports of Inspectors of Factories for the half year ending April 30, 1876 (price 1*s.* 1*d.*); Report of Select Committee on Oyster Fisheries, with plates (price 4*s.* 6*d.*); Report of the Royal Commission on

Army Promotion and Retirement, with Minutes of Evidence, &c. (price 5*s.* 8*d.*); Report of Royal Commission on Spontaneous Combustion of Coal in Ships (price 4*d.*); Report of the Inspectors of Irish Fisheries for 1875 (price 1*s.* 3*d.*); Abstract of Accounts of Loan Societies of England and Wales (price 3*d.*); Instructions respecting Reception of Fugitive Slaves on board H.M. Ships (price 1*d.*); Tables showing the progress of British Merchant Shipping (price 4*d.*); Reports by H.M. Secretaries of Embassy and Legation on Manufactures, Commerce, &c. (price 9*d.*); Annual Statement of the Trade of the United Kingdom with Foreign Countries and British Possessions for 1875 (price 3*s.*); Thirty-first Annual Report of the Commissioners of Charitable Donations and Bequests for Ireland (price 1*½d.*); Reports of Inspecting Officers upon Railway Accidents in April and May, 1876 (price 3*s.* 6*d.*); Report of the Committee of Council on Education, England and Wales, 1875-76, with Parts I. to IV. of Appendix (price 3*s.* 9*d.*); Ditto, Scotland (price 1*s.* 9*d.*); Report on the Condition and Progress of the Queen's University in Ireland for 1875-76 (price 1*½d.*); Eighteenth Detailed Annual Report of the Registrar-General of Births, Deaths, and Marriages, Abstracts of 1872 (price 1*s.* 8*d.*); Correspondence with British Representatives and Agents abroad relating to the Slave Trade (price 4*s.* 5*d.*); Report of Select Committee on Civil Employment of Soldiers, Sailors, and Marines (price 2*s.* 6*d.*); Further Correspondence respecting the Imprisonment of British Subjects in Peru (price 1*s.* 4*d.*).

OBITUARY.

FROMENTIN, Eugène, at Paris, Aug. 27, aged 55.

PROUT, SKINNER, Aug. 29, aged 69.

LITERARY WORK IN JAVA.

Tanjore: July 30, 1876.

During a recent visit to Java I was surprised to find how much has been done to elucidate the Hindu and Buddhist remains there, and, as it appears to me that a study of the antiquities of that splendid island will do much to help Indianists, I shall venture to give you a brief account of what I observed.

The Batavian Society is by far the oldest in the East (it was founded some years before that at Calcutta), and the long series of its *Transactions* (*Verhandelungen*) contains, especially of late years, most valuable treatises on the archaeology and philology of the islands which constitute Dutch India; the Society has also published some splendid separate works. The chief contributor is, unhappily, no more; on landing at Batavia I was grieved to hear of the recent death of Dr. Cohen-Stuart. This most amiable and distinguished Orientalist was born in Holland in 1825, and, as a civil servant, arrived in Java in 1846. His remarkable aptitude for Oriental studies at once attracted the attention of the Government, and he was sent to Solo (Soerabaya) to devote himself to those pursuits, which he did with the greatest singleness of mind and consequent success.

His chief works (among many of lasting value) are a critical edition and translation of the Javanese *Brata Jorda* (i.e. *Mahābhārata*) composed after a Kawi poem of 1097 A.D., and his collection of Kawi (or Old Javanese) inscriptions. Both were published by the Batavian Society. The first is especially important, as it is the only critical edition and translation that we have of a great Indian epic in a language foreign to North India. The parallel versions in Tamil and Telugu have been neglected, or nearly so, for Mr. C. P. Brown's unfinished edition of the Telugu *Mahābhārata* is all that India can show. The difficulty of such a work as this few can understand, but the value of it is evident. Such versions, in fact, enable us to partly control the matter of the an-

certain Sanskrit recensions. His collection of Kawi inscriptions extends to two parts—a folio volume of facsimiles (to the accuracy of which I can testify, as I have compared parts with the originals), and an introduction and complete transcript in Roman letters. Most of the documents are of the ninth and tenth centuries A.D., and are chiefly in Old Javanese, with a large admixture of Sanskrit. The author's untimely death has prevented an explanation of these most difficult texts, but he has left an invaluable aid in the shape of a complete index to the whole, which, with many other MSS., his widow has generously deposited in the library of the Batavian Society.

The Society has an admirable museum, rich in Hindu and Buddhist relics of an early period, of which we have hardly any remains in India. The excellent laws of Java have greatly contributed to this. In India, ancient statues or inscriptions that may be discovered are invariably destroyed for the metal—they are usually of copper—so are coins. In Java, it is penal to destroy such, but the finder is entitled to claim the full value. Thus I saw a gold image which, though very small, had been bought for about 20*l.*, and is one of the greatest treasures of the museum.

The preparation of a catalogue is in the hands of Mr. Groeneveldt, and it will be of the greatest value to Indian archaeologists. The library of the Society is rich for the East. The Catalogue of Arabic MSS. (chiefly on law) by Dr. van den Berg is sufficient proof. A scientific Oriental Jurisprudence has long been recognised in Java, though not, as yet, in India.

Even in the country towns there is much scientific zeal. At Solo, Mr. Wilkens showed me his MS. Javanese Dictionary in about thirty folio volumes. It comprises proverbs, traditions, customs, and everything of interest connected with the Javanese people. Dr. van der Tuuk has resided for some years on Bali in order to study the remaining Polynesian Hindus. Dr. Kern, the very eminent Leyden Professor, has explained several Old Javanese texts; in his hands Kawi (or Old Javanese) studies are now left. I must omit particular mention of several important treatises on numismatics, &c. Dutch powers of work and the national sincerity of character have thus done far more for Oriental research in Java than has been done in any presidency of India, or even in the whole of India in the same space of time.

During my stay in Java I was able—thanks to the unrivalled facilities for travelling—to visit the chief Hindu and Buddhist remains in the central provinces of the island. The chief Hindu temple is at Brambánan or the “place of Brahmanas.” To give an intelligible account of this and of the Buddhist temples would need a volume; I must confine myself, therefore, to the chief facts I have noticed, especially as Mr. Ferguson's great work affords a ready means of finding plans and views to those to whom the Dutch works are inaccessible. The Çiva temple at Brambánan is of the (for India) unusual form termed *caturmukha*; in one of the four faces the old Javanese custodian opened a make-shift wicker door, and I saw, to my surprise, an image of Durgā, evidently worshipped still, just as it would be in a modern Indian village. There was a streak of red paint on the forehead, and around were offerings of messes of curry and rice, and the like. For more than four centuries Buddhism and Hinduism have been supplanted in Java by Muhammadanism, but bigotry and fanaticism seem to have found no place. The temples are in ruins, but from natural causes. Originally built of small blocks of stone without mortar, the upper courses have been thrown down to a great extent, but the lower are only partly dislocated. The cause is evident; the ruins are on the slopes or in the valleys around the stupendous volcanic cones of Merapi and Merbabu, and occasional earthquakes have done the mischief.

Brambánan is in the native state of Djocdjokarta; but it is to be hoped that the Dutch

Government will, some time, have a clearance made around the bases of the great and subordinate Hindu temples, for enough is left standing to enable one, by the rules of Indian architecture, to make a satisfactory restoration of the whole, and these ruins are of the highest archaeological interest. The Çaivism of Java was evidently of the old school, and before Vedantic influences had begun to work. Çiva was then the supreme being (in Java, Bhatara Guru, who has been satisfactorily identified by Cohen-Stuart with Çiva), but Nārāyaṇa or Viṣṇu (as an emanation of Çiva) was also an object of worship. In India, very few temples of this period are left: perhaps not more than two or three near Madras, and of these one (at Seven Pagodas) is of much the same style. The museum at Batavia also possesses much to illustrate this system, which is that of the Vāyu and Brahmāṇḍa (or the real old) purāṇas. The architecture is evidently South Indian in style, and Dr. Cohen-Stuart's palaeographical researches point to South India as the source of the former Hindu civilisation of Java. I have other evidence of this, but it would take too much space to give it here.

Mandoet is a very interesting Buddhist temple, with splendid statues of Buddha (in the middle), and of *Sangha* and *Dharma* (on either side).

Boro-Boedoer is the largest ruin by far, and though it does not cover nearly so much space as one of the great South-Indian temples, it is, as a whole, larger than any single shrine or *gopura* in any Indian temple. It was evidently a dagoba, and, it being on a hill, there are terraces on the slopes, instead of the usual enclosures. The bas-reliefs here and at Mandoet are very remarkable, and I was delighted to find that they illustrate the *Jātaka*s. I believe that this has not been as yet noticed. One example must suffice: on the left side of the steps at Mandoet there is a bas-relief with (at the upper part) two birds carrying a stick in their claws by the ends, the middle of which a tortoise has hold of by its mouth. In the left corner below, two men are looking up and pointing at it; in the right, the tortoise is on the ground, and the men have thrown themselves on it. This obviously is a representation of the *Jātaka* published by Fausbøll (*Five Jātaka*s, p. 6) and the story has found its way into the *Pāṇcatantra*.

There was evidently a large emigration of Buddhists from North India to Java about the eleventh century A.D., and these took with them a Nāgarī alphabet, which is a great contrast to the Old Javanese character. It is worthy of notice that we find some inscriptions in the same character at Seven Pagodas (near Madras), which was once a great port. These emigrants took with them a highly developed form of the Northern Buddhism.

The care taken of Boro-Boedoer by the Dutch Government is beyond all praise. The magnificent volumes by Leemans and Van Kinsbergen will show that these ruins well deserve it, for the bas-reliefs there are infinitely more valuable than anything of the kind in India; the Old Javanese civilisation is represented in them down to the most minute details.

The number of statues to be seen everywhere, the inscriptions and endless ruins, show that Central Java must once have been a wonderfully successful Indian colony. The richness of the soil may have helped, but it is impossible to avoid the conclusion that the Brahmans and Buddhists were more successful, in every way, with the Polynesian Javanese than they have been with the low-type Dravidians of Southern India. Where these last have benefited much, there has been a large admixture of North-Indian blood, and for a long period. Javanese art, once equal to Indian, has (as Mr. Groeneveldt pointed out to me) sunk again to the old Polynesian level, but there are yet undeniable traces of the great success of the old Indian missionaries. Their work was ended abruptly more than 400 years ago, but there is the more reason that it should not now be forgotten. They raised what

was probably a cannibal population to a comparatively high and permanent civilisation, and made Java what Marco Polo found it, “une yslé de mout grant richesse”—a character that it still has.

CORRESPONDENCE.

THE TEMPLE OF SATURN AND THE AERARIUM.

Oxford: August 28, 1876.

The criticism of Mr. Boase on my interpretation of a well-known passage in the *Oration of Cicero pro Fonteio* (in the *ACADEMY* of August 26) is very just and fair from a scholar's point of view, and if it were a question of scholarship only there would be no hesitation in submitting to his authority at once; but it appears to me that for a passage in any author relating to a building the best explanation and interpretation is to be found in the building itself, when we have sufficient remains of it, as I contend that we have in this instance.

The Temple of Saturn was frequently called the *Aerarium*, or Public Treasury, because it was the vestibule of it; the early doorway at the foot of the steep flight of steps remains partly concealed by the *podium* or basement of the temple as rebuilt in the third century. These steps were probably built in the time of Sylla, after the public building which contained the Treasury and the other Government offices had been almost destroyed in the fire when the body of Clodius was burnt in the Senate House at the east end of this great building. These very steep steps and the walls that enclose them belong to the rebuilding after the fire; the only portions of the older building preserved seem to be the lower parts of the west and of the south walls. The latter forms the north wall of the Forum, and against this the basements of two temples are built. One is that of the Temple of Concord, which was connected with the Senate House. In this the subterranean passage of the time of the Republic remains; it led to the foot of another flight of steps leading to the Senate House, which can be traced within; but here also the communication was cut off when the temple above was rebuilt in the time of the early Empire, and the doorway is concealed. In the Temple of Saturn the passage has been destroyed in the rebuilding, but the doorway

remains visible. The steep steps were for the use of the clerks of the Treasury, who had to climb up them daily to their offices in the wooden building on the third floor. There is no doorway out of this staircase until we arrive at that level. The lower part of the steps must be cut out of the tufa rock, though covered with harder stone; they pass under the small chambers where the money was kept, corresponding to our bank vaults, but there was no entrance at that end. When the clerks had made out their accounts and had to draw money, they must have passed through the vestibule of the Senate House to have their cheques countersigned by some officer of the Senate before they could touch their money. The only entrance to the vaults being from this end, these circumstances must have been well known to the people whom Cicero was addressing, and the steepness of the steps adds pungency to his allusion. This great flight of steps has only been discovered and opened within the last few years. There seems to have been an arcade all round the building with a passage or corridor behind it. This was called a *porticus*, a word of many meanings, either "arcade" or "colonnade." When Michel Angelo rebuilt the upper storey in stone he was afraid to trust these old arches to support the great additional weight; he walled up those on the southern side as we see, and enclosed those on the western side of the building, which are visible on the present stairs of the Municipality (who still occupy the upper part of this great building, as they always did), and are shown in some of my photographs. On the eastern side he seems to have pulled down the arcade of Sylla, and left only that part of the wall on which it stood. He made great changes at the east end of the building, but the substructure and the vestibule to the Senate House remain, and the connexion between them and the bank vaults and the passage or steps to the *podium* or basement of the Temple of Concord can be traced, and the plan and section of it are given in one of my plates.

JOHN HENRY PARKER.

TWO UNPUBLISHED LETTERS OF EDMUND LUDLOW.

Göttingen: Aug. 15, 1876.

Since the review of my little pamphlet entitled *Briefe Engländer Flüchtlinge in der Schweiz* (Göttingen: Peppmüller, 1874) appeared in the ACADEMY (vol. vii. p. 369), two additional letters of Edmund Ludlow have been discovered in the Public State-Paper Office of Bern, in a manuscript volume entitled *Epistolæ ad Decanos Bernenses*. They are of the same character as those before published, and present the same points of interest for various classes of readers. ALFRED STERN.

"Monsieur,

"Monsieur le Doyen Homel fidèle ministre de l'évangile mon très honoré ami à Berne.

"Dear and honoured Sir

"It having been of late a time of counsell, the life whereof consisting in privacy and upon that account things having been variously represented I have not thought fit to trouble you with any for some weeks, having received no particular worth the communicating, but understanding by Monsieur l'Hospitalier de Ville Neuve * (who did me the favour to acquaint me and my countryman Mr. Ralfson with your kind remembrance of us, for which we heartily thank you) that you desired information of such things as came to our knowledge and one of our number having received a lettre yesterday from London dated the 3^d instant, wherein are some remarkable passages I shall here insert them verbal in, as sent to us.

"The Lord Morley and Montague having killed one Mr. Hastings, the King by his commission hath constituted the L. Chancellor Lord High Steward of England in order to the tryall of the sayd Lord Morley in Westminster Hall before 24 of his Peeres, named in the sayd Commission, which the common people say is the 3^d murder he hath committed.

"April 24.† At the sessions of the Old Bayly

* Ville Neuve, MS.

† "Weekly Gazzet," Marginal Note.

Coll. John Kathbone an old Collonell for the Parliament, William Sanders, Henry Tucker, Tho Flint, Thomas Evans, John Myles, William Westcott, and John Cole formerly officers and souldiers in the late rebellion were indicted for conspiring the death of the King and the overthrow of the government, haveing layd their plot and contrivance for the surprising of the Tower and killing of general Monke, Sir John Robinson and Sir Richard Browne, and then to have declared for an equall division of lands; the city was to have beene fiered, the percuillises * to have beene let downe, to keepe out all assistance, the horse-guard to have beene surprised in the innes, where they were quartered, severall hostlers haveing beene gained for that purpose. The Tower was accordingly viewed, and its surprise intended by boats over the moate and from thence to scale the walls. One Alexander not yet taken had distributed severall summes of money to these conspirators and for the carrying on of their designe more effectually, they were told of a councill of the greates ones, that sate frequently in London, from whence flowed (?) all orders, which councill received their directions from another in Holland which sate with the state, and the 3^d of September was pitched on for the attempt, as being found by Lilly's almanacke (a scheme erected for the purpose) to be a lucky day, a planet taken ruling, which prognosticated the downefall of monarchy. The evidence against these persons was very full and cleare, and they accordingly found guilty of high treason. Thus farre the gazzet.

"On the last of Aprill the sayd persons were hanged and quartered. It's sayd, they tooke it upon their deaths, that they never saw the face of the witnesses in their lives, and that they were trappaned to speake some words and to heare others speake and did not reveale it.

"April 21. On our coast neere Huntly foote came a young whale on shore which was 30 foote long.

"The same day it was ordered by the King and Councell, that a proclamation should issue out under the greates seale, whereby John Desborough, Thomas Kelsey, John White, John Grove, William Burton, William Scot, Sir Robert Honnywood junior, Thomas Cole of Southampton, . . . † Spurway Edward Raddon, Dr. Edward Richardson, John Phelps and John Nicholas of Monmouthshire and every one of them named are to returne into England and to render themselves by the 23 July next, in case of faylure ‡ to be attainted for high treason.

"About a fortnight since lettres out of Kent informed, that in a towne of that country, it rained severall sorts of fish, which were alive and that they covered above an acre of ground.

"That at another towne in Worcestershire a greates many doggs, more then 40 went out of the gates and there fought till all dyed but one upon the place and that this one dyed ere he got home; a good friend of ours a godly and sober person sayth I may believe this last for an assured truth, and that the like happened in Germany before the troubles there; thus farre that from England. How improbable it is, that there was any thing of reality in that pretended plot for which those eight persons above mentioned were put to death, the narrative of their owne partiall gazzeteer speakes plaine enough and truly to speake my apprehensions thereof, as farre I can discern of things and persons, I judge these persons to be thus inhumanely buched under colour of law of purpose to strike terror into others, that they may not dare speake with any for feare of being dealt withall in the like manner. This their usurpation and confederacy being founded in trechery and bloodshed must therefore (according to the received maxime) be continued and preserved by the same means as hath beene practised by them annually since their returne, but the Lord the just judge will without doubt arise speedily to witness against this barbarous cruelty and devilish policy. By a lettre which I received yesterday from a friend at Paris, though of somewhat a long date being the 3^d instant I am informed, that Hollis, C. Stewards embassadour, is preparing for his returne, there being noe hope of peace, betweene the two crowns of France and England.

"I had written thus farre neere a weeke since but for want of a messenger it hath layen by mee, soe that I have an opportunity to insert what I have received from a friend in Holland (whose lettre bears date the 15th of this instant May old stile) which is

* Portcuillises. † Blank in MS. ‡ Fayler, MS.

that it's probable the Swedes will joyne with the English against the Danes and Dutch, that the Dutch and English fleet are ready to put to sea, but that it's thought neither will bee forward to engage, but on great advantage, that these eight, who as the gazzetter observes had served the parliament (which service hee and his party are now grown to that height of impudence as to tearme a rebellion) and which for the end above mentioned were thought fit to be lately sacrificed in England, had beene prisoners upon a pretended plot twelve months before their tryall. This lettre alsoe mentions that news came the last post into Holland, that 3000 are up in Scotland, who declare that they will have their ministers restored that are put out and noe more put out and say they will see, who shall oppose them, that the court at Whitehall are in such great feare that they exercise much cruelty to ministers and others and are soe merciless to the Duch prisoners that they starve in prison for want of food and some of them who are alive eate the flesh of those who are starved for meere hunger (a cruelty scarcely to be believed but it's written) and that they are allowed but a penny a day and not soe much watter as they desire to drinke (although the Duch allow every one they take of the English 6^d. by the day) and that severall people taking notice of this miserable condition send them meate and payles of milke, but the goalers * refuse to let them have the one or the other, throwing the meate away and powering the milke down the streets, alledging that they have command soe to doe. Hee writs that the sicknesse encreaseth much not only in London but in all parts of the nation at Yarmouth, Ipswich, Harwich and all that coast, but principally at Colchester, the place where most of the Duch prisoners are kept, where they dy neare an hundred by the weeke. My friend acquaints mee that the day before the date of his lettre, the Lord Newport who for many yeares was the States embassadour in England sent his sonne to him to acquaint him (with the end hee might communicat to me) that Charles Steward had contracted with a Jesuite to destroy commissary de Witt and mee, that they were certainly informed thereof, and where hee is, being come into those parts in order to the executing of his designe and that they hoped hee was secured, but notwithstanding desired mee to be wakefull lest others were employed in the same enterprise, the same person enformed him, that the States had information that there would be suddainly a riseing in Ireland, but I pray bee carefull to whome you communicat this last. I received this day lettres from England of the 14th instant, which make noe mention of the 3000 Scots and therefore I believe there is noe truth in it. For other particulars there is not in them much in of them [?] save a confirmation of what is in the former and that the sicknesse encreases throughout the north, west, east, and south of England, and that at Colchester there dyed 180 by the weeke. I want words to expresse the obligation wee have, and the duty wee owe to our noble patron boursier Steiger,† and therefore humbly entreat you to supply that defect, and to assure yourselfe that I am with all my heart, honoured Sir,

"Your most affectionat and humble servant,

"EDM. PHILLIPPS alias L.

"This 30 of May 66.

"The witnesses at the public sessions to give a colour to that designe had the confidence to affirme that I was engaged therein."

"Monsieur,

"Monsieur Jehan Henry Hummel Doyen

"et fidèle ministre de l'évangile

"à Berne

"mon très honoré ami.

"Deare and truly honoured Sir,

"I tooke the liberty the last weeke to present you with a lettre and a box, both which I hope, you have received, and that like the master whome you serve, you accept the will for the deed. Since then I have had a lettre from my correspondent which bore date the 4 instant from London. It may be hee may make a wrong ghesse, but he writes that the warre with Holland is now inevitable, the court there being preparing sixty sayle of men of warre to be at sea next spring. He addes that clouds are gathering and thickening there, that the exchequer is shut up and not a penny of money to be issued thence, which hath not only begot an uproare amongst all sorts of people but will undoe many marchants and others

* Goalers, MS. † Steiger, MS.

particularly the gooldsmys who haveing got all the trading mony into their hands at 6 £ per cent and letting it out to the court at 25 £ per cent and sometimes at more but never under, are now caught in the snare to the overthrow of trading. I cannot imagine the end of this story, unless it bee to put the people in mutinering, that so the king may have a pretext for the taking of a French guard for the security of his person of 5 or 10000 men, which if it should not bee enough to render him absolute and to enable him to carry on his popish designe in conjunction with the king of France, that king before hee is openly engaged against any other, may furnish him with more, but this is only a conjecture, but certain it is, that the Lord, who is above them, sits president in all their counsells and hath a negative voyce upon them all and can bring good out of evill, light out of darknesse. That word in 21st of Luke 25, 26 verse seemes now to be fulfilling and that the Lord would cloth us to undergoe the present day for all the inhabitants of the earth shall be tryed. There are now about 30 gooldsmys and marchants men imprisoned in Newgate for clipping of money. Our landlady Madame Duboy is now againe cited to Berne upon the appell of her adversaries to their Excellencies from an order of the inferior justice heere, for the examining of Mr. Charner* a senator of Berne and formerly superarbiter in the case in difference for the clearing up of the businesse in controversy, and referred by their Excellencies to their examination. It's conceivd none is soe propper nor none soe able to give light in this businesse as the sayd Mr. Charner and Mr. Du Moulin, who is likewise excepted against, and who with Mr. Charner had the full hearing of this businesse. But I have troubled you soe often therein, and I find you soe fully satisfied, that I shall content myselfe with the applying me to the Lord on the behalfe of their Excellencies that hee will direct them to doe therein, as may bee for his glory and their owne peace. My wife and countrymen present you with their affectionate service and I beg of you to looke upon me as one who esteems it my happinesse to have an opportunity to expresse myselfe

"Honoured Sir

"Your most hearty and humble servant

"EDM. PHILLIPPS AL. LUDLOWE.

"72."

SOME NOTES ON HARE'S "CITIES OF NORTH ITALY."

London: August 14, 1876.

In Mr. Hare's recent book on *The Cities of North Italy* I have been surprised to find no mention of the frescoes in the Sacristy of the great church at Loreto, which, according to Vasari, were begun by Domenico Veneziano and Piero della Francesca and, their work having been interrupted by fear of the plague, completed by Luca Signorelli. Messrs. Crowe and Cavalcaselle refer briefly to these works, but do not seem to have studied the more important of them under favourable conditions of light. By recent visitors, such as Mr. T. A. Trollope and Mr. Hare, they have been entirely passed over. Mr. Sidney Colvin had not seen them when he recently wrote his most interesting article on Signorelli's works elsewhere.

The long narrow upper compartments of the octagonal roof are filled by eight tall angels; the figures are somewhat stiff, and have not the peculiar grace of Botticelli, or the splendour of the winged immortals of Orvieto. Below them sit the Four Evangelists and four Doctors of the Church. So far the work is in fair preservation. Whether in this part of it there are any traces of the earlier painters is a question for experts. At Orvieto Signorelli respected his predecessor's roof.

No one, however, can feel any doubt as to the hand which filled the eight flat wall-spaces. Over the door and opposite the window we find Signorelli at work in his full strength. The scene is laid in an open country. A party of splendid young soldiers have been surprised on the

march or during a halt by some sudden vision, of which they are in varying degrees conscious. One is totally indifferent; another struck to the ground in utter amazement. "Dimmed to incomprehensibility" is all Messrs. Crowe and Cavalcaselle can say of this noble design, which I take to represent the Conversion of St. Paul. In another compartment an appearance of the risen Christ is represented; the Saviour's head is of singular majesty. The other six spaces contain, according to Messrs. Crowe and Cavalcaselle, the "twelve apostles in pairs." My recollection does not agree entirely with this statement; but expecting to find that these frescoes had all been examined and described with the care they deserve, I took no notes at the time and may very likely be wrong. Of most of the figures, which are drawn with extreme vigour, little but a dim outline remains. As one looks on these faded walls it is impossible not to feel indignant with the ecclesiastics who, while filling their church with mosaic copies of Guido-and-water Holy Families by Angelica Kaufmann, and other suchlike inanities, have allowed their real art-treasures to fall to ruin.

The figures of the prophets in monochrome on the roof of the nave, also by Signorelli, seem to me to deserve much more attention than they have generally received. If "entirely repainted," the restorer has followed closely the old lines. Here, as at Orvieto, it is, I think, easy to discover some foreshadowing of the mightier handiwork of the Sixtine Chapel.

I have not in any way the knowledge which would enable me to criticise as a whole Mr. Hare's in some respects very useful book. But as, like most of his other works, it will doubtless reach before long a second edition, I should be glad, both for the author's and his readers' sake, to point out where, in the chapters devoted to Venice, Mr. Hare has either altogether passed over, or failed sufficiently to mark, pictures which an intelligent traveller would not willingly leave unseen.

In *Cities of North Italy* there is no mention of the *Crucifixion* at San Cassano, one of the most vivid pictures in Venice, or of the *Last Supper*, with its ghostly flight of angels and weird play of lights, and its companion picture *The Israelites in the Wilderness*, both by Tintoretto, and in San Giorgio Maggiore. The delightful Carpaccios at San Giorgio degli Schiavoni are ignored; so are the five Bonifazios in the Royal Palace, although two of them at least, *The Flight of Quails*, and *The Queen of Sheba before Solomon*, are among the most charming and imaginative works of the painter.

All that Mr. Hare says of the great hall of the same building is that "it is very handsome, and has some paintings by Paul Veronese and Tintoret." Is this adequate reference to the two great Tintorettoes, *St. Mark's Body Stolen from the Saracens*, and *St. Mark Rescuing a Sailor*, at the end of the room, and the noble row of philosophers between the windows spoken of by Mr. Ruskin as "among the finest things of the kind in Italy, or in Europe"?

Do not the Tintorettoes of the Antechapel in the Doge's Palace, the *Bacchus* and *Ariadne*, Bellini's picture in San Giovanni Crisostomo—Christostomo Mr. Hare calls it—deserve the often freely-bestowed honour of Mr. Hare's star?

Before leaving Venice may I ask in what edition of Mr. Tennyson's works the following stanza is to be found (vol. ii. p. 138)?

"Break, break, break,

On the cold grey stones, O sea!

For the tender grave of a day that is dead

Will never come back to me."

The importance of Siena justifies, perhaps, notice of the fact that the want of a good hotel, remarked on in the *Cities of Italy*, was supplied last year by the opening by an ex-courier of a new house, known as the Grand Hôtel de Sienne.

May I add to these notes, which I trust may be of some service, my humble protest against a

tendency manifested in Mr. Hare's earlier volumes, but most conspicuous in his last?

Mr. Hare's political feelings are evidently strong, and are sometimes oddly manifested, as when he qualifies the changes which have taken the head of the House of Savoy from Turin as "the late unhappy disturbances in the South of Italy."

Every man has a right to his opinions, though it may be questioned whether a guide-book is the best place to express them, or whether the discourtesy of refusing to a Government the title under which it is recognised by our own Sovereign is at any time justifiable.

But there can be no doubt that in matters outside their proper sphere politics ought not to be allowed to pervert our perceptions or bias our descriptions. In Mr. Hare's books there is plenty of proof that, while most acute to mark anything that is done amiss by the new rulers, he has no eyes for their good deeds.

To sincere lovers of the old order it would surely seem impertinent—in both senses of the word—to suggest that the right of the Popes to temporal sovereignty was affected by the many sins against archaeology and good taste of which they stand convicted. It would be well if critics would bear in mind that the same argument applies to the new Government. Impartial observers will readily allow not only that the change of Government has involved the loss of much of the unique charm of the old ecclesiastical city, but also that the present rulers have done some wrong and foolish things, and others—such as the weeding and excavations of the Coliseum—about which it is possible for there to be two opinions. But the artistic sentiment of foreigners in Italy must keep its place on pain of rendering itself not only ridiculous but useless. In its proper sphere it may, and often does, render the greatest services to art and archaeology. On these subjects the Italian conscience is open to appeals from abroad—most of all from England. When it is proposed to commit some hideous crime, such as the "restoration," lately completed, of the Paul Veronese of San Sebastiano, "cleaning" off the golden varnish laid by Titian on "Sacred and Profane Love," or whitewashing Venice—the enactment has already, I believe, been issued—our voices should be heard in the streets or anywhere else where they may be of any avail. Each of us, however, ought to remember that in so far as he allows his judgment of the thing done to be influenced by his feelings towards the doers he destroys the just force and authority of English opinion, and does an injury to the interests of art out of all proportion to any service he can possibly render a political cause. Whether Rome is to hold a Pope-King, or a Pope and King, or a Republic with neither, is a question which will be decided on other grounds than the scraping of ruins or the clothes and customs of cardinals.

SCIENCE.

A Philosophical Treatise on the Nature and Constitution of Man. By George Harris, LL.D., F.S.A., &c., &c. (London: George Bell & Sons, 1876.)

DR. HARRIS'S work can hardly fail to leave a strange impression on the mind of any modern student of psychology who is sufficiently painstaking to read many pages of it. He has been wont to think of his science as progressive, and naturally expects the most metaphysical discussion of mind to profit by the collection of observations, and the gradual shaping of conceptions and definition of problems of which the best portion of modern psychology consists. Yet here he lights on a writer who chooses to move among the conceptions of a past age, to reopen the questions warmly discussed by Fathers or Schoolmen, and to seek a final intellectual interpretation in some fragmentary remark of Aristotle or of St. Paul. Such a discovery is not a little staggering. The reader probably asks himself, with a certain sense of confusion, whether, indeed, the investigation of human nature is after all irreducible to clear objective rule and destined to remain for ever a succession of fragmentary tentatives, controlled only by the individual observer's dominant intellectual and emotional qualities. However this be, one does not exactly like to disturb a worker of Mr. Harris's sort, who, with prodigious patience, aims at constructing a systematic doctrine of man, physical and moral, to a large extent out of his own observations and reflections. To one who is keenly sensitive to the element of instability in even the best concerted psychological research there is something peculiarly grateful in the idea of falling back on this isolated mode of speculation, which has at least the merit of giving full scope to private meditation and individual constructive imagination. Yet we are not wholly free to oppose ourselves to the tendencies of our age, and possibly, with all its shortcomings, the style of psychological work which is eminently organised and can only proceed by watching and appropriating all valuable contemporary production will ultimately succeed in raising a firm and enduring structure of common certified truth.

After what has been said the reader will be able to some extent to divine the manner of Dr. Harris's investigations. There is all the Schoolmen's impartiality in the use of Christian and Pagan authorities. The teleological mode of explanation reappears in its ancient integrity, as may be seen in the following passage: "Possibly, mirth was given to man alone in order to counteract the many cares and anxieties with which he, beyond all other creatures in the world, is so ceaselessly oppressed" (ii. 323). Finally, much of the apparatus of Mediaeval ontological conception is ransacked out and re-furbished, and the reader is apt to feel a little stupefied under the perpetual clang of "substances" and "essences," "powers" and "faculties." Yet Dr. Harris's volumes are by no means a mere reproduction of earlier conceptions and theories. It belongs, as has been remarked, to his manner of speculation that it should wander off into

new and unpredictable directions, and it may be worth while to trace very briefly one or two of the most curious of these movements.

The first volume opens with a dissertation on the origination of animated beings, the nature of spiritual substance, and the possibility of its union with material. The writer here and there evidently finds his subject a rather troublesome one, and his attempts to vindicate the existence of substantial mind, while acknowledging that no substance can be "absolutely immaterial," appear to have occasioned as much perplexity to himself as they will probably cause the reader. After this we come to the heart of the subject in a book which discusses the "medial nature and constitution of man." Under this heading Dr. Harris seems to mark off those activities of sensation, appetite, and emotion which in his view spring conjointly from the bodily and spiritual substances. Yet he is not very clear in specifying the share which each substratum has in these several products. Thus he tells us that a sensation "is actually experienced in the very organ itself," and immediately after that, in the case of sight, the sensation is something mental and indeed "intellectual," and "independent of the material sense or its organ." The division of these "medial" activities is not a little curious. They consist of Sensation, Emotion, Appetite, Passion and Affection, and Animal Attachment. Love is a Passion, not an Emotion, and is altogether distinct from Affection. The simple emotions again are as follows;—Pain and Grief, Pleasure and Joy, Irritation, Surprise. If anybody asks what the emotion of irritation may be he is told that "it consists in an intense and vivid feeling of excitement to action of some kind;" and that though it is "the incipient germ or element in the production of uneasiness" it is "strictly and essentially" neither pleasurable nor painful.

Book II. deals with the moral side of man, with his desires and volitions. Dr. Harris seems to adopt the Scripture notion that among our natural propensities the evil are greatly in excess of the good. Yet it is comforting to find that though benevolence is denied the rank of an "innate principle," this same title is withheld from the opposite principle of malevolence. The writer, of course, discusses the question of free-will, and appears to think that he is at once establishing freedom and necessity; but his arguments on this subject are somewhat entangled. It is worth noting that Dr. Harris regards even passionate acts as determined by will and free-will. But this conclusion is perhaps hardly made out by the incontestable proposition that "without the concurrence of the will no voluntary action is performed."

The last book, which has to do with the intellectual or "mental" part of man's constitution, offers little for our notice. One or two rather startling statements meet us in the course of this exposition. We are told, for example, that the gambols of children and the lower animals due to an overflow of the animal spirits are "naturally if not necessarily, at once, and in every case,

of a humorous turn" (ii. 324). We are informed again that the voluntary control of memory includes, not only a power of recalling ideas from the occult storehouse of our recollections, but also an ability to discharge them from the same receptacle (ii. 378). One regrets that this clever operation is not illustrated by one or two examples.

One of the most curious features of these volumes is their multitude of notes, some of which are drawn from recent authors, as Mr. Darwin, Sir J. Lubbock, Dr. Carpenter, &c. In addition to these there are a good many remarks contributed by gentlemen to whom the author has had resort for information or criticism. Among these contributors are men of science like Professor Huxley and Mr. Galton. Many of these notes present a singular appearance in Dr. Harris's volumes, but the author seems to be wholly unaware of the vast gulf which divides his views respecting man's nature and origin from those entertained by the large majority of the exponents of modern science.

JAMES SULLY.

Scholia Graeca in Iliadem. Edited by Prof. W. Dindorf, after a New Collation of the Venetian MSS. by D. B. Monro. Vols. I. and II. (Oxford: Clarendon Press, 1876.)

FOR some time past scholars have been asking for a new and more accurate edition of the important Venetian Scholia—especially Ven. A—on Homer. Thus in his tract, *Text, Zeichen, und Scholien des berühmten Codex Venetus zur Ilias*, published in 1862, we find La Roche saying (p. 17), "Every one who has looked at the manuscript at all accurately must have arrived at the conviction that a new edition of these Scholia is not only desirable, but absolutely necessary," and Prof. Chandler, on page xii. of the preface to his *Greek Accentuation*, speaks in the same tone—"The Venetian Scholia on Homer, of which a new and more correct edition is sorely wanted." The truth is that Villosion, who first made these Scholia known to the world (Venetiis, 1788), was "vir eruditior quam prudentior;" and Bekker, who edited them subsequently (Leipzig, 1825), in part through following too closely in Villosion's steps—this applies more especially to the Scholia of Ven. B—in part from the plan adopted in his edition, in which all the Scholia from every source are arranged on the same page, is not wholly satisfactory. Some Scholia are omitted; others, originally disconnected, are joined together by the insertion of *δέ* or *γάρ*, &c.; the "intermarginal" Scholia of Ven. A are not distinguished from the "marginal," and the letters of the Codices are often placed so as to be misleading. Thus, in *Iliad* iv. we find Scholia on lines 40, 41, and 42 given in Bekker from A which are not found in A; and similarly in Books xxi. and xxii. we find Scholia from B which are not found in B. And when two or three letters are given as authority for one Scholium it is not possible to know whether the whole or part only is found in all the Codices.

This demand for a new edition is fully met in the two volumes recently issued from the Clarendon Press, which contain an entirely new collation of Codex Ven. A. The

editor is the veteran Dindorf, but the actual work of verification and correction has been done by Messrs. C. G. Cobet and D. B. Monro. What proportion of the credit is due to each of these two scholars the preface does not allow us to judge. Cobet corrected the Scholia of this edition long ago, and promised some kind of an edition, which, however, has never appeared (*La Roche, Text, &c.*, p. 17); Monro has spent months in making an entirely new collation, which was placed in Dindorf's hands. The result, at any rate, is clear. We have before us a more accurate edition of these important Scholia than has ever appeared before; and it is not likely that any subsequent edition—short of a facsimile of the Codex—will surpass the present work. As the title-page of these volumes implies an edition of all the Scholia on the *Iliad*, we have still to receive the Scholia of Cod. Ven. B, the Townley (Victorian) Scholia, and the Scholia Minora. In addition, there is to be a volume of *Annotationes*, and an index is absolutely necessary. The whole work, therefore, is likely to be of considerable compass.

Looking at the great value of the Scholia of Ven. A, and the pains which have been taken to obtain an accurate text in these volumes, one feels a little disappointed that the work is not more complete in itself. An index of words and subjects might have been added, and in the footnotes the names of the authorities from whom the excerpts in the Scholia are taken might have been supplied, together with such annotations as are here and there required for elucidation. [Cp. Hoffman, *Ilias φ und X* (Clausthal, 1864).] No one, unless he has a special purpose in view, will care to read through all the Scholia on Homer, but many scholars may wish to read and possess these volumes. Yet in their present shape the power of using them is grievously curtailed. Let us hope that the volume containing the indexes to the whole will be sold separately.

Hard words have been said of scholiasts, as of men who count verses on their fingers and give inexplicable explanations of things which require no explanation at all. To some extent these reproaches are justified. No lover of research will commend the diligence of the person who ascertained the day of the month on which Clytemnestra celebrated her "Agamemnonia" (Schol. ad Soph. *El.* 281: Οἱ Ἀργολικοὶ συγγραφεῖς εἶναι φασὶ μὴ πρὸς Γαμηλιῶνος); nor will any theologian or physicist support the laborious nonsense which is given in Schol. ad *Il.* i. 50, in answer to the futile question, "Why the plague attacked the mules and dogs before the men?" But there are scholiasts and scholiasts; and against these absurdities must be set the work of the men who have given us some of the various readings of Aristarchus, and other critics on Homer; who have told us the little we know about the editions κατὰ πόλεις, and have handed down a mass of information not to be found elsewhere, about the labours of learned antiquity, from which almost all our grammatical notions are derived. The Scholia before us preserve excerpts from Aristonicus, Dionysius, Herodian, and Nicanor, and they cannot be neglected by any one who cares for the study of Homer,

or for the history of learning, or the origin of modern grammar. Even the student of language in the stricter sense may gather something from a perusal. He will learn, for instance, that his science has been far more successful in discovering what is wrong, than in restoring what is right. He can set aside some of the old traditional explanations of Homeric words as certainly false, and reject *en masse* all Greek attempts at etymology; but, when it comes to determining the exact sense of an Homeric word obsolete in Alexandrian times, he will find his power extending only a very little way. But even these Venetian Scholia are not to be read carelessly. Bad and good are mixed together in them, and here more almost than anywhere else we need that *subactum judicium* which is the most difficult thing for the scholar to gain, as it is the thing most worth his gaining. We need the trained instinct which enables a man to distinguish the true and the false, and strike out a new and better path without wandering into tracks which are only original because they are wrong. These Scholia are not complete, but very incomplete: they are not the judicious selections of a scholar, but mere rags and fragments of a mass of learning which has perished utterly. Whether the world has gained or lost by the disappearance of whole libraries of "Homeric studies" it would be invidious to determine. Scholars will always have their own opinions, but the general reader will rightly believe that Homer is more than his scholiasts.

A remarkable feature in these volumes is presented by two facsimiles of the Codex, produced by photolithography. They are so beautiful and accurate that one is tempted to ask—Is it impossible to have the great manuscripts reproduced *in toto* by this process? What book could be more valuable to Greek scholars than an exact photograph of this Codex of the *Iliad*, or the Laurentian Codex of Sophocles? To have these within easy reach would be an inestimable boon. All collations, however accurate, fail to give the impression left by a manuscript: they cannot represent the position of a word on a page, or the colour of the ink, or other *minutiae* of great importance in settling a text.

For an Oxford edition of the text of the *Iliad* we have still to be content with Dindorf's edition of 1856. This will hardly satisfy the requirements of modern criticism, though Dindorf has with great care added an index of lemmata (in vol. ii. of the *Scholia*) in order to make that text available for the Scholia now published. For a higher work we must wait till Mr. Monro's long-promised edition appears. EVELYN ABBOTT.

The Language and Literature of China. Two Lectures delivered at the Royal Institution by Robert K. Douglas. (London: Trübner & Co., 1875.)

Those who wish to find an agreeably written introduction to the Chinese language and literature cannot do better than consult this book. It contains in a small space a large number of interesting facts.

The knowledge of Chinese is not only needed on account of our extensive trade

with China, amounting to 40,000,000*l.* per annum, but, as the author remarks, it affords a tempting field to the comparative philologist. As a language consisting of a vast collection of monosyllabic words, which are presented to us crystallised in an ancient literature, it contains rich mines which ought to be worked by those who desire to trace the history of language in the time of its early development. If from Sanskrit, with its tangled mass of agglutinations and inflexions, such great results have been obtained, what may not be expected from a simple language like the Chinese? Simplicity preceded complexity. The roots of the linguistic tree, however much they may run into ramifications of their own, never reach the variety of growth which we find above the ground in branch, leaf, flower, and fruit. Let the philological enquirer study language in more primitive forms than the Sanskrit, and expect light to fall on the problem of the origin and childhood of human speech.

There is the more reason for adopting this course because of the progress lately made in cuneiform and Egyptian studies, which have brought to light the circumstance that the principle of Babylonian and Egyptian writing is in one important respect identical with the Chinese. All three have a system of primitives and determinatives. Mr. Douglas introduces examples furnished him by Dr. Birch from Egypt, and by Mr. G. Smith from Babylon. The primitives are the phonetics of China, and the determinatives are the radicals. In all these three systems of writing the first step was to paint objects. The next step was to assign a fixed sound to the picture, which was, of course, the name of the object. The third step was to borrow the sign, now become a phonetic, to be the written symbol of other words agreeing with it in sound. When ideographic writing had gone as far as this, and was in the hands of many ingenious people of various countries, it was not a very difficult leap into the unknown to proceed to syllabic writing and the construction of a syllabary. This was rendered necessary by the polysyllabic character of the languages of Western Asia and of Africa. The syllabary led to the alphabet. Thus it appears right to say that polysyllabism was the cause of alphabetic writing, and that the reason why the Chinese have never needed, or at least thought they did not need, an alphabet, was that their language is composed of monosyllables, for the written expression of which, phonetics, made to serve as a syllabary, are found to be sufficient. Surely then the Chinese language deserves to be studied as logically anterior to polysyllabic languages, and possessing a form which it seems proper to regard as more primitive than any of them.

Mr. Douglas has drawn attention to the Chinese intonations, and this is a feature which, if studied carefully, would add fullness and thoroughness to the treatment by philologists of tone and accent in western languages. Especially is it important to discuss the waves and slides of the voice as distinct from both pitch and intensity, and also from quickness and slowness of utterance. Hadley, in his *Essay on the Greek Accent*, omits the mention of slides of the

voice, a subject familiar to the Greek grammarians and quite as important as pitch. A study of the Chinese tones is likely to give just the information needed to describe clearly the Greek tones, and prevent this most essential point from being overlooked—viz., slides of the voice directed upwards or downwards, and single or compound.

Mr. Douglas makes a strong plea for the study of the language. He does not think so hopefully of the literature. While he seems to condemn the classical poetry for being too simple in style and diction, he claims for it, however, a rich vein of sentiment. What can be more valuable in historical research than to have for perusal the actual poems of a people in love with simple language, and those poems three thousand or more years old? Indeed, Mr. Douglas, by his extracts from the old poetry, invests it with interest in spite of the faintness of his praise.

In his judgment of Confucius and his very severe condemnation of the *Chun tsew*, our author endorses the views of Dr. Legge. I fear both are wrong to some extent. They agree in saying that in that book no moral judgment is expressed on actions, and that the details of actions are omitted. But the idea of Confucius was that the mention of crimes and virtues is enough for blame and for praise, if the words of the historian are so selected that the goodness or badness of an action is manifest from the words employed. This the honorific character of Chinese phraseology admits of in every instance. So the judgment of the native reader is uniform, and coincides with that of Confucius himself in every case. The uniform verdict of conscience is always assumed in China as certain to follow the historical statement of a crime or a virtue. Ever since the time of Confucius the nation has chosen to adopt his rules for the employment of words in reference to the acts and personages of history, and he is admired as the founder of this moral jurisdiction exercised by history over the conduct of men. The book is regarded as the mirror of morality; and Kwanti, god of war, the ideal of an honest military patriot, loyal to the heart's core, is represented as daily conning the *Chun tsew*. How can this fact be accounted for except on the supposition that moral judgments are expressed quite intelligibly in the *Chun tsew*?

JOSEPH EDKINS.

SCIENCE NOTES.

GEOLOGY.

ANOTHER noble volume has recently been contributed to the fine series of Reports which are being issued by the United States Geological Survey of the Territories. In Prof. Meek's Report on the *Invertebrate Cretaceous and Tertiary Fossils of the Upper Missouri Country*, we have a fit companion to Dr. Cope's *Cretaceous Vertebrata of the West*, recently noticed in these columns. As the different groups of the Cretaceous and Tertiary formations of the Rocky-Mountain region were originally established by means of the invertebrate remains described by Prof. Meek, his Report will undoubtedly become a standard work of reference for students of these formations. It is true that brief preliminary descriptions of many of the species here described have already appeared, but

in the present Report these descriptions have been entirely re-written, and are extended to genera and sub-genera. There are also some valuable critical remarks on synonymy, and a good deal of information on the geological and geographical distribution of the fossils. Occasionally the dullness of technical description is relieved by a little controversial writing, as where Prof. Meek replies, with some warmth, to the strictures of Dr. Stoliczka on his determinations. Valuable as Prof. Meek's Report undoubtedly is in itself, there can be no question that its value is vastly increased by the excellence of the illustrations by which it is accompanied. These illustrations include forty-five quarto plates, containing about a thousand figures of fossils; and it would really be difficult to say too much in praise of the execution of these lithographs. On closing the volume one feels impressed with the magnitude of the labour which so large a work represents, and under this feeling one is inclined to endorse Dr. Hayden's prefatorial remark, when he commends the Report to the Department of the Interior as "one of the most important contributions ever made to the science of palaeontology in any portion of the world."

In the last number of the *Bulletin* of the U.S. Survey of the Territories, Prof. Meek describes some fossils from Vancouver's Island and other north-western localities. Most of these were collected many years ago by Mr. Gibbs, the geologist of the North-western Boundary Commission. Some are of Carboniferous, others of Cretaceous age. The Carboniferous species were obtained from a limestone on the eastern slope of the second principal range of the Rocky Mountains, and their occurrence would seem to encourage the hope that true Carboniferous coal may be found further south, near the line of the North Pacific Railroad. The Cretaceous fossils were principally obtained from two localities in Vancouver's Island. To the same number of the *Bulletin* Mr. O. St. John contributes some notes on the geology of north-eastern New Mexico, illustrated by a small sketch-map, and by several rough but expressive sketches. This number of the *Bulletin* completes the second volume, and we regret to hear that there is some chance of so useful a work coming to an end. "Whether the *Bulletin* will be continued hereafter," says Dr. Hayden, in the preface, "will depend on circumstances which cannot now be foreseen."

FIVE new species of fossil fishes from the Lias of Vassy, in L'Yonne, have been described by M. H. E. Sauvage in the last number of the *Annales des Sciences Géologiques*. They belong to the genera *Ptycholepis*, *Caturus*, and probably *Pachycormus*. Figures of all the fossils are given. In the same number of the *Annales*, M. Charles Brongniart describes a new genus of fossil Entomostraca from the Carboniferous rocks of the neighbourhood of S. Etienne. This genus has received the name of *Palaeocypris*, and the species is dedicated to M. Alphonse Milne Edwards, under the name of *P. Edwardsii*.

THE last number of the *Bulletin de la Société Géologique de France* is devoted to a record of the proceedings of the Society at its annual general meeting, held last autumn at Geneva and Chamonix. Among the more notable papers here published is one by M. A. Favre, on the geological structure of the country around Geneva; and another by M. Colladon, on the lacustrine terraces of the lake of Geneva. Some other papers bearing upon local geology are printed in full and duly illustrated.

As it is undoubtedly of great interest to note such evidence as geology may afford in support of the theory of descent with modification, we may call attention to some recent palaeontological researches in this direction by Drs. Neumayr and Paul. Their studies have dealt with certain species of lacustrine gasteropods from the Upper Neogene deposits of Western Slavonia, which are probably equivalent in age to some of our Pliocene deposits. The lacustrine beds consist for the

most part of sands and clays, with seams of lignite, extending to a thickness of about 2,000 feet. They form two great groups, each having a distinctive fauna: the lower stage, known as the *Congeria*-beds, corresponding to those of the Vienna basin, offers evidence of having been laid down in brackish water, but the beds pass upward into fresh-water deposits; while the upper group, known as the *Paludina*-beds, is purely lacustrine. This *Paludina* series may be divided into three principal groups, and subdivided into eight minor groups or zones, each with a characteristic fauna. These beds have yielded no fewer than forty distinct forms, or so-called species, of the genus *Vivipara*, or *Paludina*; and by carefully comparing these the authors are able to establish connecting links, showing clearly the derivation of the more recent from the older forms. The divergence between the various types is so great that in some cases the extreme terms of the series have actually been placed in distinct genera. By thus tracing the descent of the later forms of *Vivipara* from their ancestors in the older beds, a pedigree is established comparable with that of the well-known case of the descent of the horse from *Hipparion*. Neumayr and Paul's original paper will be found in the *Abhandlungen* of the Vienna Geological Reichsanstalt, and an abstract of the memoir has been communicated to *Nature* by Prof. Judd.

SWISS palaeontologists have given evidence of the growing interest taken in their science by issuing the first part of a new Journal—the *Memoirs* of the Swiss Palaeontological Society—which has been recently published in Zürich. It contains two memoirs—one a monograph by Dr. C. Moesch on the genus *Pholadomya*; the other a paper on fossil plants from Sumatra, by Dr. Oswald Heer. It is well known that the European Miocene flora indicates a sub-tropical climate, and that a similar flora has been traced northwards but not southwards. Any opportunity of studying the characteristics of the Miocene flora of tropical countries should therefore be readily seized, and hence we welcome Dr. Heer's observations on some plants recently sent from Sumatra by Dr. Verbeek. These remains were found in a marl-slate overlying *Fusulina*-limestone; the marl becomes sandy in the upper part, and passes eventually into a true sandstone which contains some important seams of coal. The collection of plants comprised only thirteen species; but by studying them Dr. Heer concludes that the age of the marl-slate and of the coal is certainly Tertiary, probably Miocene. Many of the plants are nearly related to such as now live in tropical Asia, and therefore point to a similar climate during the age in which they existed. Some remains of fishes from this marl-slate have been examined by Prof. Rüttimeyer, and his studies point in the same direction as those of Prof. Heer.

FROM the programme before us we gather that the exploration of the Cresswell Caves carried on last year by the Rev. J. M. Mello, assisted by Mr. Heath, is now being conducted by a committee of which Sir John Lubbock, Bart., M.P., is president, and Prof. Boyd Dawkins, secretary. The superintendence of the work is in the hands of the Rev. J. M. Mello, the secretary, and Mr. Heath. The results are now being classified in Owens College, and we are assured that when the report by Mr. Mello and the secretary is presented to the Geological Society of London it will add as much to our present knowledge of palaeolithic man as the discoveries in Brixham did to the knowledge of 1857.

METEOROLOGY.

The Physiological Influence of Weather.—Mr. J. W. Osborne laid before the American Association last year an account of an instrument by which he endeavours to obtain a measurement of the sensation produced on our bodies by different types of weather. The paper has just appeared in the *Proceedings* of the Association. He has a porous

cylinder filled with water and then exposed to the action of the air, thereby losing water and also heat. He then maintains the temperature at a constant height above that of the outside air by the supply of warm water. This cylinder represents our system, the porous walls corresponding to the skin, and the supply of warm water to the action of respiration in generating heat. In addition to the thermometer, which gives the temperature of the cylinder, an ordinary wet-and-dry-bulb hygrometer is exposed to the same atmospheric conditions as the cylinder. The mode of experimenting is as follows: the temperature is raised above blood-heat, and the water agitated. The temperature is now allowed to fall to blood-heat, and then, by means of stop-watches, the time of sinking each degree below that is noted. From six to ten readings, according to the weather, are sufficient to show the character of the curve. The experiment may be varied by raising the temperature much above blood-heat, and then proceeding as before, when the curve of observation will be found to approach a straight line. Mr. Osborne says it is premature as yet to give results, but he quotes the following obvious deductions: 1. The sensible temperature affecting us departs widely from the actual; 2. The fluctuations are infinitely greater in amount than most of us have any idea of; 3. That, besides the great changes from day to day in the mean sensible temperature, we have what may be called instantaneous oscillations, also very considerable in amount, and scientifically all but unknown; 4. The wind very often plays a more important part in determining the sensible temperature than the actual temperature itself; 5. The instantaneous oscillations are almost solely due to fluctuations in this meteorological element.

Rainfall and Evaporation.—In the course of the spring this subject occupied two evenings at the Institute of Civil Engineers. The papers were by Mr. Symons on the floods of 1875, and by Mr. C. Greaves on the results of his twenty years' experiments on evaporation and percolation at the East London Waterworks. The entire discussion has now been published, and it will be seen from it how very far we are as yet from any sufficient knowledge of how we are best to render our rainfall available for our water-supply. No less than twenty-two gentlemen, many of them of great experience, took part in the discussion, either orally or by written communications, but it is perfectly evident that we are not yet agreed on the first principles in the measurement of percolation and evaporation, all existing methods of determining these elements having been sharply criticised by more than one speaker. Mr. Greaves' results, however, as having been derived from twenty years' careful observations on one place, are of very high value, and are the best series of evaporation investigations with large gauges in this country; they embrace also observations on gauges floating in water. Various other tables by Dr. Gilbert and Mr. Evans are well worth attention.

Meteorology at the Equator.—Lieut. Brault, whose new wind-charts we have more than once noticed, has published in No. 456 of the *Bulletin* of the Association Scientifique his views on the seasonal movement of the equatorial calms. He shows it not to be a simple oscillation in latitude from winter to summer and back again, but that in summer the calms lie over the central Atlantic, while in winter they approach the African coast, and in spring and autumn their position is not fixed, but on the whole lies near Africa. The same question has been taken up by Prof. A. Mühry in the recent numbers of the *Austrian Journal*, where he subjects the materials for Square III. published by the Meteorological Office to a most elaborate examination, and draws from them conclusions favourable to his own well-known theories of atmospheric movement.

Rainfall at Oxford.—Mr. Main has laid before

the Ashmolean Society a discussion of the rainfall of Oxford for twenty-five years. His results do not seem to indicate any periodicity. The wettest year was 1852, 40.42 inches; and the driest 1864, 17.56 inches. The only appearance of periodicity is given by a table of the rain for the four months June to September, from which it looks as if the dry summers occurred at ten-yearly intervals.

Mean Temperature of Cracow.—Prof. Karlinski has published in the *Proceedings* of the Cracow Academy, and in the German language, a discussion of the mean temperature of that station from fifty years' observations. The constants for reduction to daily means are taken from the readings of a Pfeiffer's thermograph for the period of 5½ years. The thermometers are forty feet above the ground. The mean temperature for the fifty years is 46°·2, and ranged from 42·7 in 1871 to 50°·9 in 1834. The coldest day is January 10, -14°·4: the warmest July 24, 92°·1. The greatest cold observed was -26°·5, and the greatest heat 101·1. The whole is a valuable addition to our knowledge of Continental meteorology.

Simultaneous Oscillations of the Barometer.—Mr. J. Allan Broun has printed in the last number of the *Proceedings* of the Royal Society two papers on these oscillations, which have already attracted so much attention. He starts with those observed in India, which he shows to be inexplicable by any theory of connexion by currents, and to closely resemble the changes in terrestrial magnetism. In the second paper he discusses the great barometrical oscillation, March 31–April 5, 1845, at stations varying in position from Makerstown to Hobarton, and shows that from the simultaneity of the phenomena they must be due to a cosmical cause such as he indicates.

The Journal of the Austrian Meteorological Society.—The recent numbers have contained, besides Dr. Mühry's paper already mentioned, some interesting notices of the very unusual weather of the early part of the present summer. Almost unheard of cold in May in Russia, and serious rainfall and inundations in Switzerland in June, at a time when for days together hardly a drop fell in England. Notices of the meteorology of Abyssinia, of Mexico, of Portugal (with Madeira), and of Leh in Ladakh, are supplied by Dr. Hann.

A New Form of Aneroid.—Prof. Weilenmann has devised a new form of aneroid, which he considers to possess many advantages. It consists of several vacuum chambers fastened one above the other. A vertical rod is placed in contact with the top of the whole. This rod is furnished with a scale, and is pushed up and down with the variations of elevation of the box lid. Its position is read off with a microscope moved by a screw and by the motion of this screw the changes of pressure are measured. Of course this instrument is free from any risk of rusting of springs, &c.; but it is far less compact and portable than the older pattern.

Temperature of the Upper Strata of the Atmosphere.—Prof. Mendeleff has published in the *Archives Scientifiques* for March a paper in which he urges that the only real information we have as to the temperature of the upper region of the atmosphere comes from balloon ascents, as the observations on mountains are affected by local circumstances, and that, therefore, we should devote our energies to securing observations from captive balloons. He does not, however, tell us how to moor the balloons so as to secure our observations in the time of a stiff breeze, not to speak of a storm.

MICROSCOPICAL NOTES.

THE irrepressible Spontaneous Generation controversy has again been opened by Dr. Bastian, in a communication to the French Academy (*Comptes Rendus*, July 10). This time the atmospheric

germ theory is supposed to be overthrown by the fact that when urine has been boiled, and any germs it may have contained destroyed, bacteria appear if potash and oxygen are introduced. Dr. Bastian stated in his paper that he operated with great care to avoid errors; but M. Pasteur observes that his experiments are substantially the same as those which he himself published in 1862, in a memoir entitled, "On Organic Corpuscles which exist in the Atmosphere: an Examination of the Doctrine of Spontaneous Generation." M. Pasteur, at that time, found that certain germs can resist a temperature of 100° C. in neutral or slightly alkaline solutions, while if the solutions were made acid they perished. In the first case it seemed as if the hot fluid did not penetrate their envelopes, while it did so in the second. M. Pouchet had previously pointed to the curious fact that the workmen at Rouen found that some of the seeds of certain plants adhering to wool from Brazil germinated after several hours' boiling. The seeds that withstood this action of hot fluid were protected by their envelopes; while those whose envelopes yielded and whose substance was affected did not germinate. M. Pasteur advised Dr. Bastian to take care that no germs were introduced into his fluids by the potash he employed. If he made it red-hot first, or heated the solution of it to 110° C. he would find no development of life. M. Pasteur thinks it rather hard that the physiologist is obliged to pay attention to all the fresh stories of spontaneous generation, while the mathematician, from the more advanced state of his science, need not trouble himself to refute fresh schemes for squaring the circle; and the physicist is not called upon to reconsider projects for obtaining perpetual motion. We have certainly reached a point at which no spontaneous-generationist who comes forward with what are substantially only repetitions of old experiments is entitled to scientific attention unless he has established a sufficient reputation for the minutest accuracy as a manipulator. As might be supposed, Dr. Bastian did not accept M. Pasteur's explanations. He sent a fresh paper to the French Academy (*Comptes Rendus*, July 31), to which M. Pasteur replied the following week. Dr. Bastian called the supposition that germs could survive immersion in caustic potash solution "incredible," and contrary to a great number of experiments he has made this year. These experiments, he affirms, "show that a solution of potash, boiled, can render sterile urine fertile." He challenges M. Pasteur to show that germs of bacteria can survive boiling in solution of potash as used in pharmacy. M. Pasteur says in answer to these remarks, that

"if urine rendered alkaline produces bacteria without its containing any fecund germs of these organisms, it cannot much matter for the success of the experiment whether it is neutralised by potash in solution or by potash that has just been melted, or whether the urine is taken as it comes from the bladder with sufficient precaution against external contamination, or from any other vessel. The experiments to which he referred on July 17 prove to demonstration that boiled urine rendered alkaline by solid potash does not produce bacteria, and that fresh urine coming from the bladder and saturated with the same alkali does not produce any."

It is obviously a question of experimental accuracy, and Dr. Bastian's reputation is by no means sufficient to stand against that of Pasteur.

THE *Volvax minor* of Stein is the subject of a paper by M. L. F. Henneguy (*Comptes Rendus*, July 24), who describes it as dioicous, while the *V. globator* is monoicous; and its reproduction has been recently described by Cohn (*Beiträge zur Biologie der Pflanzen*, 1875). The dioicous volvox is a colony of unicellular algae, each member being furnished with two vibratile cilia, and all disposed regularly in the gelatinous wall of a hollow sphere. M. Henneguy finds four kinds of these colonies, which he calls *coeno-*

biums: 1, containing only vegetative cells, and having young coenobiums in their interiors, each derived by division and multiplication of a vegetative cell; 2, a great number of these coenobiums which contain, likewise, male elements, *androgonidia*, situated in the thickness of the gelatinous wall; 3, those which exhibit only vegetative cells and androgonidia, and not producing any daughter colonies; 4, female coenobiums which contain only *gynogonidia*, or oospheres in the interior of their spheres. The androgonidia are formed at the expense of a vegetative cell which acquires a larger volume than the rest, and divides into parallel segments, each having the form of an elongated cone with its thickest end green, and the other one transparent with a little red point, and two vibratile cilia. The bundle of antherozoids exhibits a continual oscillation in the antheridium. The gynogonidia spring likewise from a differentiation of a vegetative cell, which grows much larger than the androgonidia, and becomes full of starch and chlorophyll granules, giving the oospheres a dark-green aspect. At the moment of fecundation the bundles of antherozoids are set at liberty by the dissolution of the antheridia wall; they move quickly through the water, and fix themselves on the female coenobiums, and then separate to fecundate the oospheres, but the author was not able to observe the exact moment of their penetration. After fecundation, the oospheres surround themselves with a thick membrane having a double outline, which was not previously visible, and rapidly change colour, passing from dark green to yellow green, and then to orange. They then contain a red oily matter and a larger quantity of starch. This orange coloration made some observers suppose it was a separate species, the *V. aureus*, Ehr. These volvocina, male, female, and neuter, seek the light and keep near the surface of the water; but when the female colonies are fecundated they get away from the surface. In a glass vessel, the green ones will be seen on the side of the light: the others on the opposite side. If the vessel is turned round they change places, and the orange ones fly from the light quicker than the green ones seek it. When these objects first appear in the waters where they are formed scarcely any but neuter colonies are seen—that is to say, only those which give rise by segmentation to daughter colonies. After a little time the number of colonies contained in each coenobium diminishes, and then a great number appear with the androgonidia, which represent aborted daughter colonies. At this moment we find a few female groups not containing daughter colonies. After reproduction has gone on for some time by means of daughter colonies, we observe the number of female coenobiums augment, and some composed exclusively of males appear, while the neuter sorts become very rare. M. Henneguy compares these facts with what occurs among plant-lice, which degenerate after the parthenogenetic production has gone on for some time, and their digestive and generative organs tend to atrophy. Males are then produced, and, subsequently, females requiring fecundation.

MR. STEPHENSON, who, some time since, introduced the binocular microscope bearing his name, which was found to work well with high powers, is now able to use it effectively with a one-twenty-fifth objective, constructed by Zeiss, of Jena, and mounted specially so that the optical combination may come near enough to the prisms.

THE *Monthly Microscopical Journal* for August contains, among other matters of interest, a description of an efficient pocket spectroscope made by Mr. Hilger on a suggestion of Mr. H. C. Sorby. It is little more than $1\frac{1}{4}$ inches long and $\frac{3}{8}$ ths in diameter. The object of this contrivance is extreme portability, and it is intended to bear the same relation to a larger microspectroscope that a pocket lens does to a microscope. A paper,

with illustrations, relates to the spermatozoa of that curious-tailed batrachian, *Amphiuma tri-dactylum*, by Dr. Christopher Johnston of Baltimore. He found the movements of these spermatozoa very remarkable—the swimming membranes they are furnished with making an apparent spinal motion from the head towards the tail when the objects were moving freely, but in a reverse direction if they became entangled. The blood-disks of the creature, measured with an eye-piece micrometer, gave a maximum conjugate diameter of $\frac{3}{16}$, rather in excess of photographs made by Dr. Woodward, but Dr. Johnston observes that his measures were made upon instantly-recent discs, while Dr. Woodward's were preserved for thirty-six hours in a small vial deposited in a refrigerator. Another paper with illustrations (translated from *Schultze's Archiv*, Band xii.) is on the "Ossification Process in Birds, and the New Formation of Red Blood Corpuscles during the Ossification Process." For details we must refer to the paper. The author confirms Gegenbauer's view that what he calls osteoblasts are real bone-formers, but he is not prepared to assert that in the bones of birds the osteogenous elementary substance contains living matter.

THOSE who take an interest in the curious mechanical question of ruling such lines as those on Nobert's test-plates will be glad of the information and suggestions contained in Mr. Rogers' paper on this subject taken from the *Proceedings of the American Academy of Arts and Sciences*. We also find a note from Mr. Kitton, commending Mr. Bramhall's new oblique illuminator (made by Baker). He describes it as "a disk of silvered glass about an inch in diameter, mounted in a fitting similar to a selenite stage." He finds it the best apparatus he has tried for resolving fine striae.

THE attention of microscopists may be called to a prize of 1,000 fr. offered by the Medical and Surgical Society of Bordeaux, and to be decreed in 1879, for the best microscopical study of human blood, fresh and dry, from the foetus to the adult, in comparison with that of other mammals, and from a medico-legal point of view.

ON Saturday last (August 26), Mr. Baillie Hamilton gave a lecture on his new Aeolian Tones, at the Lecture Room of the South Kensington Museum, W. H. Stone, Esq., M.D., in the chair. Mr. Hamilton explained the growth of the conception from the well-known Aeolian harp, modified by making the wind play through jams on only a part of the string, by flattening that part of the string, and, as in Mr. Farmer's wind-violin, by attaching the string to the extremity of a free-reed which was moved by a bellows. Mr. Hamilton then stated how he had attempted to modify Mr. Farmer's arrangement by having strings attached at each end to fixed supports in the usual way, and also attached at some portion of their lengths by upright rods to harmonium reeds. The tones thus obtained were very beautiful, but there were practical objections which had now been overcome by considering that the string acted only as a constraint upon the motion of the reed. According to Mr. Hermann Smith, the air in a reed organ-pipe acted in the same way, and even in a flue organ-pipe, because there was then really formed an aero-plastic reed. Acting upon this observation, Mr. Hamilton and Mr. Smith had tried whether other elastic constraints which had not the same practical inconveniences as strings would not answer the same purpose. Various contrivances by means of metal and other springs were tried with various degrees of success, and at last an extremely simple, cheap and effective method had been discovered. A piece of brass wire was soldered at one end to the frame enclosing an harmonium reed, or metal tongue, the end of the wire pointing to the fixed end of the reed, and the point of attachment being much nearer the free end. Then this wire was bent round in a circle, and, passing

through a little loop or staple affixed to the upper part of the reed, was carried three or four inches further, coming out beyond the free end of the reed, and forming a sort of proboscis, bent like that of a butterfly. By drawing the wire through the staple, the circle could be made tighter or looser, much modifying the constraint. By straightening or curling up the proboscis the pitch could be flattened or sharpened more than an octave, so that tuning to any pitch could be effected without filing the reed. By modifying the form of the circle into a more or less flat ellipse, or even making it rhomboidal, different qualities of tone were produced. Several specimens of the tones were sounded, and a harmonised air was played. The effect was that of a very rich organ tone, entirely free from the usual defects of the harmonium-reed tone. There is now no doubt that a great discovery in the production of musical tones has been accomplished, and that a more convenient instrument than the organ can be produced at a very much smaller cost, and with qualities of tones in some cases superior, in others equally good, although for others opinions may differ. But the present simplicity has been attained by very hard work for several years, and a long, varied and expensive series of experiments.

FINE ART.

MICHELANGELO.

Le Lettere di Michelangelo Buonarroti; publiccate coi ricordi ed i contratti artistichi, per cura di Gaetano Milanese. (Firenze: Le Monnier, 1875.)

Vita di Michelangelo Buonarroti, narrata con l'aiuto di nuovi documenti, da Aurelio Gotti. Two vols. (Firenze: Tip. della Gazzetta d'Italia, 1875.)

Life and Letters of Michelangelo Buonarroti. By Ch. Heath Wilson. (London: John Murray, 1876.)

(First Notice.)

UNTIL last autumn the *Life of Michelangelo* by Dr. Hermann Grimm—a book both translated and read in our own language—was the standard authority on the subject. The writer had neglected none of the sources at his command; but these had been rather of a tantalising nature, and it was known that other and very important sources existed, though they were not accessible. Since the rival memoirs of Vasari and Condivi came out, in his own lifetime, the materials for a biography of Michelangelo had received only one great addition down to the year 1873, when Dr. Hermann Grimm's fourth edition appeared at Hamburg. Scattered letters and other documents had, indeed, been printed from time to time in collections like Gualandi's *Memorie* and the *Lettere Pittoriche*; the zealous Danish investigator, Gaye, had found and published useful materials among the Florentine archives; and the editors of the *Lemonnier Vasari* had made further contributions. The one great thing, however, was the bundle of Michelangelo's letters, chiefly to his father, brother, and nephew, which had found their way from among the Buonarroti family papers to the British Museum. Some of these were published by M. Piot in his *Cabinet de l'Amateur*, and Dr. Hermann Grimm had the use of them all. But it was known that a still more considerable mass of documents remained unused in the Casa Buonarroti, which had been Michelangelo's own house, in the Via Ghibellina at Florence.

This house and its contents had become public property by the bequest of its owner, Cosimo Buonarroti, a distinguished jurist and minister under the Grand-Duchy, when he died in 1858; but the conditions of the bequest did not give students access to the papers. Dr. Grimm was therefore shut out from this store of personal, biographical materials. On the other hand, he made a great use of general, historical materials. He mastered the period, and his book, from this point of view, has the national virtue of exhaustiveness, but also the national fault of superfluity. It is an elaborate essay on that subject which has fascinated so many writers in recent times, the politics and culture of Italy at the Renaissance. It is also an elaborate essay on Michelangelo; but the combination of the two themes is mechanical. Much that we are told of the time seems irrelevant to the man; we feel that we are asked to apprehend the time, not so much in and through the man, which is the way we want to apprehend history in a biography, as beside him, and because it is German to be thorough. Only thoroughness, in Dr. Grimm's method, while it urges him to fill chapters with what we knew before—the doctrine and fate of Savonarola, the valour of Ferrucci, the state and wonders of Venice—allows him, on points really vital to the career of his hero, to repeat tales which a little technical judgment and enquiry would have enabled him, as we shall see, to set right. But in fact Dr. Grimm, though he is both an intelligent and enthusiastic writer, hardly possesses either the instinct or the training which gives authority in matters of art. In criticism he is not always very sure of his impressions, and his enthusiasm does not always help him to the right word. Sometimes he works himself up, and when all is done, seems to have spoken not only with effort but beside the mark. In short, although his book was the best we had, it was easy to imagine a better.

Then, in March of last year, came the four-hundredth anniversary of Michelangelo's birth, and in September the festival held at Florence in its commemoration. The occasion was taken by those who had the requisite authority to give to the world a great part of the documents hitherto kept secret. Signor Gaetano Milanesi, to whom we already owed so much excellent work among the municipal archives of Tuscany, brought together and printed in a single volume all the existing letters of Michelangelo, as well as his private memoranda, and a number of contracts and agreements between him and his employers. In this collection, a large proportion of the letters are printed for the first time from the papers in the Casa Buonarroti; most of the remainder are re-edited after careful revision and comparison either with the originals or old copies from the originals; and all are reduced to something like a uniform and intelligible orthography. To this liberty, as to the similar liberty taken by Dr. Moritz Thausing in the more difficult case of the Dürer papers, objections may possibly be made, but not by real students, only by affected purists who do not know what MSS. are. Signor Gaetano Milanesi is one of the most

experienced and most judicious of archivists, and his volume is invaluable. Perhaps, indeed, instead of printing in separate groups the letters addressed to separate correspondents, it would have been more convenient for biographical study to arrange the whole body of correspondence in order of date from beginning to end. As it is, we have to turn to half-a-dozen different places in the volume for as many letters of the same year or month, if they happen to be written to different people. It will also appear, upon this question of date, that there is at least one letter, undated by the writer, which the editor out of deference to tradition puts in a year to which it certainly does not belong.

What we want next, to complete our materials after this publication of Michelangelo's letters to other people, is a publication of other people's letters to Michelangelo. This need has not yet been fully satisfied. But it is partially satisfied in the *Life* published, also for the anniversary last year, by the Commendatore Aurelio Gotti, Director of the Royal Galleries at Florence and one of the trustees under the will of Cosimo Buonarroti. In the composition of this book, Signor Gotti has made use of many unpublished letters of Michelangelo's correspondents as well as of his own; and some others he has printed in the appendices which fill his second volume. These appendices furnish also genealogies of the Buonarroti family both before and after Michelangelo; facsimiles of his handwriting; specimens of the contemporary or nearly contemporary music to which some of his verses were set; an elevation and section of his wooden model for the dome of St. Peter's; the inventory of his goods taken at his death; and, finally, a praiseworthy although of course imperfect attempt at a catalogue of the known sculptures, paintings, and drawings of the master, drawn up with the help of museum directors and others in all quarters. It is no disrespect to the Commendatore Gotti to say that this second volume of appendices is the most valuable part of his work. In his first volume, with the help of the new materials, he has retold the story of Michelangelo's life, pleasantly and readably indeed, but not at all profoundly, and, as he himself puts it, "fuori d'ogni artificio d'ingegno e d'ogni abbellimento di fantasia." Of the two opposite extremes which are the dangers of an Italian prose style, artificial magniloquence and colloquial triviality, the prose of Signor Gotti leans to the latter; he scarcely has the classic art peculiar to the masters of his tongue—the art of which Gino Capponi lately left so rare an example in his *History of the Florentine Republic*—of being at once perfectly familiar and perfectly distinguished. General history Signor Gotti touches but lightly, and for criticism he is content to echo Condivi and Vasari, writers whose time-honoured tattle, whether on matters of fact or matters of taste, their modern countrymen are always loth to disturb. Indeed, one cannot but regret that curious conservatism which deters even scholars in Italy from seeing the force of new evidence when it contradicts these ancient authorities, whose nearest approach to a love of truth was a

love of anecdote, and their one stimulus to accuracy their dislike of each other. Lastly, to Signor Gotti's chapters are prefixed woodcuts representing scenes in Michelangelo's life, by artists not wholly unknown, yet in a style so puerile as seriously to disfigure his volume.

For English readers the results of these Italian publications of last year are set forth for the first time in Mr. Heath Wilson's volume now before us. Mr. Wilson frankly announces in his title-page that his *Life* is "partly compiled from that by the Commendatore Aurelio Gotti," and states in his preface that his first intention was simply to translate the work of the Italian writer. Certain researches and conclusions of his own, however, presently seeming incompatible with this purpose, he determined to write his book in his own way; whereupon Signor Gotti none the less courteously, says Mr. Wilson, allowed him to make use of all the new materials from the Casa Buonarroti with which he was himself working. The consequence is that the English book, while in general it runs parallel with the Italian, takes a line very distinctly its own at certain points. Mr. Wilson has lived in his subject, and so long ago as 1842 had occupied himself with technical observations on the frescoes of the Sistine Chapel. He writes without any pretension to literary power, and even, one would judge, without the facility which comes of much literary practice; but he has two qualifications, a scrupulous sense of facts and a practical knowledge of processes, which enable him once and again to see the bearing of the evidence as others had not seen it, and really to establish new facts in the life of the great master. Mr. Wilson has, indeed, one passage which might have led us to doubt his technical discrimination; and that is where he scouts the Fesch *Entombment*—the picture bought for the National Gallery from Mr. Macpherson in 1868—as the "feeblest of fictitious Michelangelos," and speaks of the "strange and gaunt bearer with one leg" as "marked by the ugly features, thin form, feeble outline observable in the design of" Pontormo. Now, a picture unfinished and tampered with, like this, always suggests doubt and discussion; and when Mr. Wilson objects to the old man's head, everybody will be with him—it has evidently been painted in by a later and weaker hand—but when he misses the extraordinary force and grandeur in the carrying attitudes of the bearers, and the not less unmistakeable type and dignity of Michelangelo in the unfinished faces on the spectator's right; when he fails to see here that quality which elsewhere (p. 148) he justly notes as peculiar to this master, an unrivalled science in observing and expressing the mutual pressures and yieldings of bodies and drapery; above all, when he suggests Pontormo, to whom surely we have here no analogy whatever; why, we begin to wonder where we are.

Except in this instance, however, where reconsideration seems called for, the criticisms of Mr. Wilson are generally judicious and sometimes penetrating; nothing can be truer than what he says about Michelangelo's shortcomings as an architect in his first experiments, and the gradual increase

in power, and command of proportion, which we can trace when in old age he was more and more constantly versed in that art. Nor does there seem any reason to distrust Mr. Wilson's minute and very interesting technical account of the methods of the master in painting the great work—the one complete and unthwarted work—of his life, the frescoes of the vault in the Sistine Chapel. Mr. Wilson's opportunities for examining this vault were such as have fallen to the lot of no one else, the Papal authorities having allowed him to raise a scaffold for the purpose. On the strength of this examination and of the new documents together, though, indeed, neither was strictly necessary for the purpose, Mr. Wilson has for good and all demolished Vasari's fable, according to which Michelangelo, having summoned a company of assistants from Florence in order to learn from them the use of fresco (and this although he had in his youth been the salaried apprentice of the prince of fresco-painters, Domenico Ghirlandaio), and finding their work unsatisfactory, one day suddenly dismissed them all, and then, continuing the task entirely alone, completed it in no more than twenty months of labour. This account, although perfectly and transparently impossible, had been repeated, with a protest from the editors of the *Lemonnier* Vasari, and an uncertain demur from Signor Gotti, by all writers down to the present day, I think, with the exception of Mr. Black in his compilation published last year. It so happens that a letter of Michelangelo to his father, in which he mentions the final completion of the work, is undated; and even Signor Gaetano Milanesi has consented to assign to this, in order to square with Vasari's account, the date 1509. Mr. Wilson takes both the old and new documents, and by a chain of reasoning which we have not space for here, but which seems to us thoroughly conclusive, shows that the history of the work will have been the following. Michelangelo came to Rome about the end of March, 1508. Between that and the beginning of May, besides working at his drawings and cartoons for the great scheme, he will have superintended the putting up of a proper scaffold to supersede the useless one constructed by Bramante. On May 10 he enters a receipt for 500 ducats from the Pope for the painting of the vault, for which (*per la quale*, not necessarily *on* which) he says that he begins that day to work. On May 11 a certain master-mason acknowledges receipt of ten ducats for work done in pointing and rough plastering in the chapel. On the 13th Michelangelo writes to Florence for some of the best blues, having to paint or cause to be painted (*avendo a fare dipigniere ovvero dipigniere*, not having, as the old accounts assume, already begun) certain things for which they will be needful. On the 24th, and again on two days in June, the same master-mason acknowledges receipt from Michelangelo's assistant, Granacci, of more payments for the same kind of preparatory work as before. In July, Granacci is away in Florence, engaging the services of other assistants. At the end of this month, it seems likely that Michelangelo himself paid a short visit on business to Florence, and in August he will have begun with his as-

sistants; one of whom at any rate, Jacopo l'Indaco, remained with him as late as January, 1509. The work was conducted among many difficulties and disappointments, the Pope proving impatient and a bad paymaster, the artist being constantly teased by his family, and some of the work suffering and having to be renewed; until at the beginning of November, 1509, the scaffolding was removed and the portion so far completed thrown open to public admiration. And when the scaffolding was put up again, it was not put up entire; as in a letter of September, 1510, Michelangelo talks of money required by him for completing the scaffold, "so as to proceed with the rest of my work." One of the newly-published documents, a letter of Michelangelo to his brother Buonarroto, bearing date September 18 (or, as Mr. Wilson quotes it, September 15), 1512, marks a further stage in the history. In this, his family being as usual in difficulties, Michelangelo says he has not a groat to help them with, but is himself without shoes or clothes, and cannot have the money due to him until he has finished his work—manifestly the same great work on the Sistine vault. At the end of the same letter he says he hopes soon to come and see them all. And within a month he did come, for we have Sebastian del Piombo's well-known letter of October 15, written from Rome to Michelangelo at Florence, and describing a conversation held about him between Sebastian and the Pope. So that we may infer that the work was finished and the account settled some day between these two dates, September 18 and October 15, 1512. To this interval must probably be transferred several undated letters of Michelangelo which Signor Milanesi assigns to the year 1509; and assuredly that one, at least, in which we read the quiet words: "I have finished the chapel which I was painting; the Pope is well enough pleased." And thus we get, between the preparations of the summer of 1508 and the date of this letter, the period of four years and five months, within which—not within twenty months—it is reasonable and possible that even these colossal powers can have completed their colossal task.

What is more interesting still is the light which is now for the first time thrown on that strange episode, the flight of Michelangelo from Florence during the siege in the autumn of 1530. Two of the documents now before us alter all our knowledge of this circumstance. We knew before that Michelangelo had suddenly and mysteriously gone to Venice in the midst of the siege, that he had been put under ban in consequence, and on his return with a safe-conduct had been reinstated in the direction of the defensive works, where he did true service after as before the flight. And we knew that Michelangelo's own subsequent account of the matter, as reported by Busini, was, that having been warned by Mario Orsini of the meditated treachery of the commander of the defending forces, Malatesta Baglioni, he had endeavoured to put the Council on their guard, but the Gonfaloniere Carducci would not listen to him; and that then, despairing of the issue, he had felt constrained to depart. Either Michelangelo's

recollections must have been confused, or else he thought it indiscreet to speak fully of what had really happened. It appears now that he was not once only, but twice, away at Venice in the course of the siege, and the first time not as a fugitive but on some confidential mission. A memorandum of expenses incurred at Venice, dated September 10, and inscribed "to my honoured superior," proves thus much conclusively. Of this first and authorised journey, on which he was accompanied by Rinaldo Corsini, we had never heard, but only of another journey, on which Rinaldo Corsini was supposed to have accompanied him but did not. This second journey was unauthorised and really in the nature of a flight, the consequence of importunate warnings and irresistible presentiment. Proved of iron as was Michelangelo's heart both for daring and enduring, his imagination was withal so quick that more than once already either warning or presentiment, or both, had wrought him to precipitate despair, and to departures upon which a coward would have never ventured. Thus, in 1494, the vision of Cardiere had driven him from the house of Piero de' Medici; and thus, in 1506, he had fled from Rome when he found himself slighted at the Vatican. The flight from beleaguered Florence was the flight of a brave man convinced that the game was up. We have now Michelangelo's own letter from Venice, after the flight, to the friend with whom he meant to have made his way to France. It seems that towards France his thoughts had been for some time bent. We did not need his word for it to understand that he had been nevertheless "resolved without any fear to see the war out first." Saying this by the way, he goes on to describe the warning to which he had yielded:—

"But on Tuesday morning, September 21, there came out one by the gate of St. Nicholas, where I was at the bastions, and said in my ear that stay longer I must not, if I wanted to get off with my life; and he came with me into my house, and dined there, and brought me mounts for my journey, and never left me until he got me out of Florence, making me understand that it was for my own good. Whether God or the devil was he that did this I cannot tell."

Whether God or the devil: that is, whether really a friend to Michelangelo, and anxious only for his safety; or a friend to Baglioni, and anxious only to get rid of Michelangelo for fear he might mar the plot; but in either case aware that the plot existed. Michelangelo could not tell which at the time, and we shall never know; only what really passed at the bastions, and at what persuasion he really left the city, so much we at least have learned. SIDNEY COLVIN.

ADOLF TIDEMANN.

THE death of Adolf Tidemann, which occurred last week at Christiania, deprives Scandinavia of the most celebrated of its contemporary artists. He was born on August 14, 1814, and had, in consequence, just completed his sixty-second year. Born at Mandal, a small town in the south of Norway, from whence he proceeded almost direct to the Academy of Arts in Copenhagen, he had no great acquaintance in childhood or youth with the native scenes and customs the illustration of which has made him famous. About the year 1836 he

proceeded to Düsseldorf, where he was at once greatly successful, and led the van of that troop of Norwegian and Swedish painters who have ever since flocked to the art-capital of Northern Germany. In the commencement of his career he dedicated himself to historical art, and it was not till he returned to Norway in 1842 that he began to study the habits of the Norse peasants. After an extensive tour in 1843 he commenced the series of *genre*-pictures by which he is so widely known. The most interesting of these are the large works now preserved in the National Gallery of Christiania, and the twelve pictures painted in the Royal Palace of Oscarsholm, on the island of Lødegaard, near the same city. In these his individual genius, stern and rugged as it is, is seen to best advantage. *The Fanatics*, a composition of almost unearthly horror, and a marvellous pathological study of emotion; *The Emigrants' Farewell*, painted in 1855; *The Bear Hunters*, 1862; *The Lonely Old Man*, 1849; *Single Combat in Norway*, and other works, are familiar over all Europe, either in reproduction or in occasional exhibitions. Visitors to the 1862 exhibition in London will remember the truly brilliant *Bridal Procession in Hardanger*, lent by Lord Ellesmere, of which the landscape is by Gude, and the figures by Tidemann. A series of engravings from Tidemann's peasant-pictures were issued at Düsseldorf in 1852, and have been repeatedly reproduced. The most ambitious work attempted by this artist was an altar-piece of the Baptism of Christ in Trefoldighedens Kirke in Christiania, a composition of colossal figures. Such work was, however, beyond the painter's scope.

The genius of Tidemann was characteristically Norwegian. Severe, conscientious, and scientific, his art fails in beauty and sometimes in interest, but seldom in power. Always grave, his compositions are sometimes sombre and often melancholy. A subject of morbid intensity fascinates him in spite of, and sometimes because of, its want of beauty. In point of execution his work is unequal; often vigorous and effective, it is apt to be thin and poor when the scenic or incidental side of the subject failed to interest the artist; as a colourist he was cold, and never without the visible marks of a stunted growth under shadow and his compeers. But as a *genre*-painter of the highest kind, as a narrative and national artist, translating life into painting in the way that our own Crabbe did into poetry, he had few equals, and was well worthy of his great and wide popularity.

Another Scandinavian artist of some notoriety has lately died, C. F. Kiörboe, the animal-painter. He was born in Slesvig in 1800, served in the Swedish army from 1829 to 1846, having, however, from 1840 lived mostly at Paris, where he enjoyed for more than thirty years a very considerable reputation, exhibiting year after year at the Salon. One at least of his works, the *Inundation*, a hound tied to the roof of a kennel, with her whelps drowning around her, a picture of almost tragical force, has attained popularity all over the world in the shape of little engravings and photographs. Kiörboe died at Dijon.

EDMUND W. GOSSE.

NOTES AND NEWS.

MR. WHISTLER, who is about to start for Venice, has lately been employed in decorating the dining-room of Mr. Leland's house at Prince's Gate. The furniture of the room has been designed with the special purpose of displaying a valuable collection of blue-and-white porcelain arranged upon the walls in a light and graceful framework of carved wood, and Mr. Whistler's decoration has accordingly been so planned as to give support to the effect of the china and at the same time to assume a coherent and independent scheme of its own. Upon the ceiling, which is covered with a uniform

ground of gold, divided by light wooden groining, the artist has painted in deep blue an ornamental design, representing in sufficiently conventional character the plumage of the peacock. In the panels, from which are suspended a series of glass lamps, he has presented the large eyes of the bird's fan, combined with every variety of curving lines that meet and intersect with a delicate ornamental effect. By the side of these panels are others, in which the lighter and softer plumage of the bird's breast is represented, and this two-fold scheme of ornament is repeated on a smaller scale in the double cove which serves as cornice to the room. Here the breast plumage takes the appearance of an ordered design of blue powdering upon the gold ground, but this conventional and purely ornamental character is secured without sacrificing the living suggestion of the bird's feathers. The execution is ordered, but by no means mechanical, and there is room beneath the fixed features of the design for a free and varied treatment of details. For a space beneath the cornice the wall is covered with stamped leather, the original pattern of which has been modified and enriched by the introduction of a fair primrose tint into the flowers patterned upon the deep ground of the gold. This serves to bring the different golds into relation, and carries the eye to the panels beneath, where upon the lighter ground the same pattern of plumage is repeated. The gold of the door-panels and window-shutters is similarly treated, and upon the inside of the shutters, so as to occupy the space of the windows at night, the artist has placed full-sized representations of the bird itself. The disjected members are, as it were, here collected, and the life of the design impressed by images of the living peacock. It will be seen that in this scheme of decoration Mr. Whistler has trodden upon new ground, and has essayed a very interesting experiment in a branch of art where tradition is too apt to exercise extravagant authority.

THE collection of pictures belonging to Earl Spencer which is now on exhibition at South Kensington is peculiarly rich in examples of the English school. Both Sir Joshua Reynolds and Gainsborough are admirably represented, the latter in particular by two slight but very delicately painted portraits of the Duchess of Devonshire as a child. In one of these the artist has made choice of a delightful scheme of pink colouring, contrasting with admirable taste and refinement the tints of flesh and costume. A full-length of the same lady in later life is less interesting in an artistic sense. The Duchess in her child-life is again charmingly presented by Sir Joshua Reynolds, who gives the little girl standing by her mother's side. In the room adjoining these English portraits there is an interesting collection of artists' portraits by themselves, including heads of Reynolds, Verrio, Lely, Wilson, and a supposed Rembrandt. In this same room are several excellent Vandycks, and in the next a few examples of Italian art.

THE papers to be read at the Social Science Congress at Liverpool, which commences October 11, promise to be of unusual interest, especially in the new department of Art. Mr. Stevenson, who has thought the subject well out, is to lead off the question of Street Architecture with a paper which, it is hoped, will give rise to a discussion that may lead to actual and tangible results, as Dr. Richardson's paper in the Health Section at Brighton has done. Mr. Eastlake has promised a paper upon the "Application of Art to Articles of Domestic Use," which ought to rouse a general interest in this important question. There is great attention now paid to this subject in limited circles; but even here the real value of the question is not appreciated. If we are to refine the tone of our handicraftsmen, they must be employed in the manufacture of articles which are not only useful but beautiful. It is only a small portion of the community that can

buy pictures, but there is no reason why the humblest workman should not have tea-things that are artistic in form, and furniture, however simple, that does not offend the taste.

MR. ROBERT COLLINSON, one of the principal art-instructors at the South Kensington Schools, having recently retired on a pension after a meritorious service of about twenty-three years, Mr. Stark has been appointed to succeed him.

THE latest publication of the Arundel Society is a large chromolithograph of the central portion of an altar-piece by Hans Memling in the cathedral at Lübeck. This altar-piece is enthusiastically praised by Dr. Waagen, who considers it one of Memling's finest works; but it is spoken of in much colder terms by Messrs. Crowe and Cavalcaselle, as being far inferior in style and execution to his smaller pictures. It is probable, indeed, that in a work of this kind much of the execution was left to pupils. It is about the largest picture extant of the Early Flemish school. The central panel now published gives, however, a good idea of the quaint grace, minute detail, and exquisite finish of the master. Much of the beauty of the colouring is necessarily lost in the reproduction, but there are no glaring or crude tones to offend the eye. The subject represented is the Crucifixion, with all the attendant circumstances that Memling loved to introduce. The side panels of the same altar-piece, representing Christ bearing the Cross and the burial and resurrection of Christ, and the two exterior panels of the Annunciation, are promised by the Arundel Society next year, and the four figures of SS. Blaise, Egidius, John, and Jerome, in 1878.

A CONCLUDING volume to Schnaase's *History of the Fine Arts* has just been published. It is edited by Dr. W. Lübke and Dr. O. Eisenmann, and contains a revised history of the Flemish school up to the end of the fifteenth century. The second edition of this vast work is now complete.

MM. FIRMIN-DIDOT are now publishing an important Dictionary of Architecture (*Dictionnaire Raisonné d'Architecture*), by Ernest Bosc. The complete work will form four volumes, containing 4,000 columns of text and about 4,000 illustrations. It is being brought out in monthly parts.

A CHRISTIAN work of art of the fourth century has recently been added to the museum of the Vatican Library. It is a portion of a glass tazza, decorated with painted figures representing the baptism of a child, who is placed under a vessel, from which streams of water issue. The mystic dove, with outspread wings and olive-branch in its beak, descends upon the head of the child. A figure on the right of the child, dressed in tunic, pallium, and girdle, acts as the officiating priest, his name, "Mirax," being placed on his neck. Near the child's head also is the word "Alba," probably indicating the name. This tazza was probably an offering from relations or friends on the occasion of the baptism of a child in early Christian times.

AN etching by J. Klaus, from a powerful and highly-finished sketch by Rubens for his great picture of *The Bearing of the Cross* in the Brussels Museum, forms the frontispiece of the *Zeitschrift für Bildende Kunst* this month. The original sketch belongs to the Royal Academy at Vienna. Its vigorous life and broken light and shade are effectively reproduced. The first article of the number describes a frieze by Buonaventura Genelli which at present decorates a verandah in the house of Prof. Preller at Weimar. Two small illustrations are given of this coldly classical work, in one of which Fame is represented as crowning the artist, while Poetry and Phantasy look on, or rather turn away, and appear either unconscious or unconcerned. Herr J. A. Wolff contributes some interesting particulars respecting the old German masters Johann Joest and Johann Stephan von Calcar, and also rescues from oblivion the names of several other masters who worked in

Calcar at the end of the fifteenth century. A writer who signs himself "V. V.," in reviewing a new work by Conrad Fiedler entitled *Ueber die Beurtheilung von Werken der Bildenden Kunst*, discusses the merits of the theory of art-criticism that Fiedler attempts to establish. He calls it "Eine Erkenntnistheorie." The two other articles have to do with the Philadelphia and Munich exhibitions.

M. EUGÈNE FROMENTIN, who has just died at the age of fifty-six, was a pupil of the landscape-painter Cabat. His first picture, exhibited at the Salon of 1847, was *Les Gorges de la Chiffa*; in 1849 he gained a second-class medal, and was shortly after despatched on an archaeological mission to Algeria, which enabled him to study the types and scenes which he was so happy in reproducing. He gained a first-class medal in 1859 and 1867, and was decorated with the Legion of Honour in 1859. His last works, exhibited in 1875, were *Le Nil* and *Un Souvenir d'Esneh*. M. Fromentin was also an author; among his principal works are *L'Été dans le Sahara*, *Les Simples Pèlerinages*, *Une Année dans le Sahel*, *Dominique*, and *Les Maîtres d'Autrefois*.

THE STAGE.

MR. BYRON AT THE GAIETY.

THE pieces which are written by Mr. Byron with a view to his own appearance in one of their leading characters are necessarily influenced in great degree by the quality and limits of the author's powers as an actor. Mr. Byron is evidently modest enough to regard himself as not possessed of any great versatility; nor does he ever aspire to move the imagination of an audience by the slightest approach to a serious situation. He is essentially a light comedian; but his range is far more narrow than that of most other light comedians who have won an equal reputation. Mr. Charles Mathews has sometimes made an attempt to persuade us that he is in earnest, and has always failed. On the other hand, there is really a good deal of variety in his most successful assumptions. Mr. Byron, on the contrary, does not even aspire to variety. To stand, somewhat stiffly, at ease and to utter with an air of unlimited leisure and innocent unconsciousness an endless number of ingenious puns, quaint witticisms, and sarcasms of a not too-ill-natured kind, at the expense of the other personages of the pieces—these, together with a certain dryness of tone which will often give an appearance of point to a rather pointless joke, may be said almost to exhaust the list of the means by which this gentleman has so often achieved a practical success. His model seems to have been Mr. Sothorn, and it may perhaps be remembered that in his earlier acting days Mr. Byron delighted to assume a certain air of intellectual imbecility, or rather of mental torpor, which gave the charm of additional unexpectedness to his clever sayings. For this purpose he affected at that time blonde wigs with that very distinct and very straight parting down the middle which has somehow become associated in the public mind with a plentiful lack of ready wit. But his Simon Simples, and his undisguisedly clever people of a later period, may easily be resolved into the same person by reference to their essential attributes. To afford opportunities or excuses for dropping witticisms in a quiet way while looking, not at the person supposed to be addressed, but generally over his head, at some point on the opposite wall, seems to be the paramount object of all these creations; and naturally the pieces in which they figure exhibit tokens of having been hampered by so arbitrary a condition. It is true that, though always occupying a very prominent position in the play—as a writer who writes for himself has a right to do—Mr. Byron does not, as a rule, perform an important function in the mere story of his pieces. Whether his heroes and

heroines be enjoying the peace and prosperity which are generally accorded them in the first act; the sudden reverses and the straits and difficulties which are no less frequently their lot in the middle position of the play; or the renewal of love and restoration to affluence which are still less dispensable conditions of the climax, he is as likely as not to take no part but that of dropping in upon them in all these stages, either to become a sort of personified commentary upon their proceedings, or to figure as an officious adviser, ever ready to exhort and stimulate them to efforts of some kind. He is, in brief, often the mere chorus of the play; yet the play could not proceed without him. Half the good things he utters are doubtless irrelevant, but while he is uttering them the story waits for Mr. Byron; nor can it well go on again till it receives some new impulse from the same source.

This peculiar mode of constructing pieces has often served Mr. Byron in good stead; and, if his latest production in this way is less successful than others, it is perhaps not so much that the public are tired as that Mr. Byron himself has grown weary over the business. In the *Bull by the Horns*, produced at the Gaiety on Saturday evening, we have all these features; but the characters are more faintly sketched, and the element of plot is attenuated to the point of almost complete disappearance. The story, so far as there is any story, arises from the exaggerated jealousy and uxorial despotism of two ladies, who ultimately drive their husbands to take chambers in the Temple, and to practically assert their right to live a life of bachelor freedom. The lesson is not lost upon the ladies, nor are they spared other humiliations, for on visiting the chambers they are recognised by a sentimental waiter, and a wild Irish gentleman calling himself "The O'Tarragon," as old sweethearts, and thus are compelled to make confession of having deceived their husbands so far as to have falsely asserted that they had "never loved before." The discovery and recognition furnish the author with one of those odd farcical surprises with which he is fond of terminating an act; but it otherwise brings with it no consequences beyond that of preparing the wives for complete submission and reconciliation. With this slight thread of story Mr. Byron is connected only because he is the bachelor friend who suggests "taking the bull by the horns," and who aids and abets the matrimonial rebellion down to the complete triumph of the two husbands. In the piece itself there is very little that is really humorous except Mr. Maclean's highly-finished portrait of a needy Irish gentleman of the Costigan type, and the little sketch of the sentimental waiter, who has a sad story to tell of wounded affection, but is always snubbed before he can succeed in unfolding it to a sympathising ear—a part performed by Mr. Fawcett.

Unfortunately even the jokes which have so often saved a weak play from Mr. Byron's pen seem to suffer on this occasion from the want of freshness and animation which oppresses the piece. Not a few turn upon the mere arbitrary assignment of names to the personages, as when it is remarked that somebody has "put Pepper in his will," and Mr. Byron feigns not to perceive that Pepper is the name of a gentleman referred to. Occasionally—as where the name of the penniless O'Tarragon provokes the observation that he is "the *Owe* Tarragon decidedly"—even the aid of the printer is required to make the point intelligible. A few more examples will serve to show the quality of the verbal pleasantries with which the dialogue of *A Bull by the Horns* is thickly studded. When Mr. Byron exclaims, "Here's a pretty termination to my good offices!" Miss Farren, looking round at the walls of the chambers in the Temple, observes, "I don't call them good offices; never saw such shabby rooms in my life." Then Mr. Soutar innocently remarks that "he has not the head he used to

have;" on which Mr. Byron observes that "It does not matter, as any change must have been for the better." French dishes are described as "giving the notion that the garlick has been having a row with the vinegar, and has got the best of it." When Mr. Byron tells Mr. Soutar that he is blenching, he adds, "I don't know what blenching is exactly, but, whatever it is, you are blenching;" and he declares that Mr. Soutar's appetite is so terrible that he has "seen waiters turn pale at his approach, and has known one boiled-beef establishment go into liquidation in consequence of his patronage." When the waiter says his master will "come round with the carte," Mr. Byron observes that there is "no necessity to drive round." Uncorking a bottle of Clos Vougeot suggests to the same gentleman that he "might say Old Clo' Vougeot," which seems to refer to some peculiarity in the odour of the wine. In like manner, a bottle of Champagne described as "extraordinary dry" leads to the proposition that "Pods," a name of one of the characters, will be "extraordinary dry too." A troublesome visitor gives rise to the remark that, as he is difficult to get rid of, we must call him "Winter goods." When Mr. Royce says that he "saw Earl Russell carrying peas yesterday," Mr. Byron interposes with "Yes, early peas." Certain sherry is described as "dry as a three-volume novel;" and a gentleman is said to have "come out of a tavern a walking wine-vaults." Witticism of this kind could hardly do much to avert the tokens of dissatisfaction which were unpleasantly frequent during the performance of the piece on Saturday evening.

The burlesque of *Don Caesar de Bazan*, which is also from the pen of Mr. Byron, is an extravaganza of the old reckless sort, in the course of which an actor who is conscious of humorous inspiration and sure of his audience may do almost anything he pleases, and in fact can hardly do wrong. Mr. E. Terry, who has transferred his services from the Strand to this house, is one of those actors; and there is a certain grotesque drollery in his tones, attitudes, and movements which is not to be resisted by those who have an inclination for pieces of this kind. The piece is bright and lively. Miss E. Farren, as Don Caesar, causes much merriment by her clever mimicry, and Miss Kate Vaughan is a graceful and vivacious representative of the gipsy girl.

MOY THOMAS.

A NEW drama, entitled *A Fight for Life*, by Messrs. Savill Clarke and Du Ferreaux, founded on the novel of the same name, has been produced at the Theatre Royal, Bradford, and, as it is stated, with success.

MR. J. S. CLARKE will re-open the Haymarket Theatre this evening for one week only, preparatory to the production of Mr. Gilbert's new drama, *Daniel Druce*. The Court Theatre will re-open on Saturday next for a short season, under the management of Miss Helen Barry, who will produce a new comedy-drama, entitled *Ethel's Revenge*.

MUSIC.

THE BIRMINGHAM FESTIVAL.

Birmingham: August 29, 1876.

Of all our provincial musical festivals that at Birmingham unquestionably holds the first place. Not only is it one of the oldest, if not the oldest, of existing music meetings, but both as regards its financial and its artistic results, it occupies a position almost without a parallel. With regard to the former, a word or two will suffice. Like most similar festivals, that at Birmingham is held with a charitable object—the special institution for the benefit of which the performances are given being the Birmingham General Hospital. From a statement prefixed to the programme of the present meetings we learn that since their

foundation the festivals have yielded a grand total of 102,781l., the whole of which has been paid over to the hospital.

Even more important, from an artistic point of view, has been the musical history of these festivals. It was at Birmingham in 1840 that Mendelssohn's *Lobgesang* was heard for the first time in England; it was here, too, that on August 26, 1846—thirty years ago within a few days—*Elijah*, which was specially composed for the festival, was produced under the direction of the great composer; and, though the managers of the Festivals have not been fortunate enough to obtain a second *Elijah* since, they have, by the commissions they have so liberally given to composers, done much for the furtherance of musical art in this country. The list of works expressly composed for Birmingham within about twenty years includes Sir Michael Costa's *Eli* and *Naaman*, Bennett's *Woman of Samaria*, Benedict's *St. Peter*, Sullivan's *Light of the World* and *Kenilworth*, Barnett's *Ancient Mariner* and *Paradise and the Peri*, Hiller's *Nala and Damayanti*, and Randegger's *Fridolin*. The festival which commenced this morning shows no falling off in the matter of novelty, three works—Macfarren's *Resurrection*, Cowen's *Corsair*, and Gade's *Zion*—having been composed expressly for the occasion.

The total vocal and instrumental force, as given in the printed list of performers, amounts (exclusive of principal vocalists, organist, and conductor) to 503. Of these there is an orchestra of 103 strings and 34 wind instruments, the woodwind being judiciously doubled, to balance the large mass of violins; while the chorus numbers 361 voices—96 sopranos, 92 altos and contraltos, 85 tenors, and 88 basses. It will be seen that as regards balance of the parts such a chorus as this leaves nothing to desire. Sir Michael Costa, who has conducted the last nine festivals here, occupies his accustomed post, and Mr. Stimpson presides, as usual, at the organ, which, as many of our readers will be aware, is one of the finest in the country.

The whole of yesterday was occupied with a full rehearsal. Some idea of the amount of labour undergone by the performers may be formed when it is stated that the rehearsal was called for nine o'clock, though it was somewhat later before it actually commenced, that it continued with only half-an-hour's intermission until six, and was resumed at eight for upwards of two hours. As nearly the whole of this time was occupied in the practice of the various novelties to be produced, it will be imagined that the mental as well as physical strain on all concerned must be considerable. It would be hardly fair to pronounce a decided opinion from rehearsal; I shall therefore merely say that, so far as could be judged yesterday, there seems every reason to believe that the excellence of the performance will be fully worthy of the reputation of these festivals. Of the novelties I prefer to say nothing till after their actual production.

This morning the festival opened with *Elijah*, a work with which Birmingham has special association, and which since its first production here in 1846 has never been omitted from a festival programme. It would be a waste of time to criticise a work so universally known as Mendelssohn's oratorio; it will suffice to say that the part of the Prophet was magnificently sung by Mr. Santley—who was hardly in his best voice, and appeared to be suffering from a cold—and that the other solos of the work were sustained by Mme. Lemmens-Sherrington, Mme. Trebelli-Bettini and Mr. Edward Lloyd, in the first part, and by Mdle. Titiens, Mme. Patey, and Mr. Vernon Rigby, in the second. The chorus singing was excellent, the points being taken up with great precision; there was no want either of force, or, where needed, of delicacy. The same cannot, unfortunately, be said of the band. Of force there certainly was no want; but the coarseness of the accompaniments,

especially of the brass instruments, was (as is unfortunately generally the case under Sir Michael Costa's otherwise admirable direction) an absolute torture to listen to.

Wednesday, Aug. 30.

Last night the first of the novelties composed for this festival was given—Mr. Frederick H. Cowen's dramatic cantata, *The Corsair*. It is with much gratification that I am able to record a success which was not only genuine but thoroughly well deserved. So far as can be judged from a short acquaintance, I am inclined to consider this Mr. Cowen's best work. The libretto has been skilfully adapted from Lord Byron's poem by Mr. R. E. Francillon, and the cantata contains in all thirteen numbers, many of which are of more than ordinary merit. The introductory chorus, though pleasing, is hardly one of the best pieces in the work; but the ballad (No. 2) for Medora "I know not, I heed not," is charming, and very ingeniously accompanied by wind-instruments and guitar. The succeeding duet "My own Medora" is also very good, and leads to one of the gems of the work, the chorus of slaves "Twine we the roses." Among the best of the movements which follow are the very piquant "Dance of Almas" (No. 6), the Entr'acte (No. 8), and the immediately succeeding song of Conrad's "Come, O sleep, and give me rest from sorrow," the duet "My soul is free," and the prayer "Hear me, Heaven." The whole work shows not merely technical fluency in writing, but great dramatic feeling, and considerable inventive power. Many of the melodies in the cantata are not only really charming, but fresh, and without the least suggestion of a reminiscence. If there is an objection to make to the work it is that it is perhaps ultra-dramatic in style for a concert-room; it would doubtless be far more effective on the stage. The cantata is not only a most interesting work, but is even richer in promise than in performance; and we shall await with eagerness the new opera which Mr. Cowen is writing for Mr. Carl Rosa's company.

The performance, which was conducted by the composer himself, was, on the whole, satisfactory. With so much new work as that which the Birmingham choir undertakes, there must necessarily be some uncertainty in the execution, arising from the unfamiliar nature of the music; and there were certain parts of Mr. Cowen's cantata which, to speak plainly, went very indifferently. For this the composer, whose conducting is excellent, is not to blame; the shortcomings arose from want of more rehearsal. Many parts, however, were excellently given. The solos were in the hands of Mdle. Titiens, Mme. Lemmens-Sherrington, Mr. E. Lloyd, and Signor Foli—Mdle. Titiens and Mr. Lloyd carrying off the honours. The charming "Dance of Almas," already mentioned, was encored; and many other numbers were very warmly applauded. A miscellaneous second part, consisting almost entirely of operatic selections, according to what seems to be the "regulation pattern" of provincial musical festivals, concluded the evening. It needs no criticism beyond an expression of astonishment at finding such a piece as Braham's old duet "All's well" in a Birmingham Festival programme. It looks as if the managers thought any rubbish good enough for Birmingham! The artists who took part in the selection were Mdle. Albani, Mme. Lemmens-Sherrington, Mme. Trebelli-Bettini, Messrs. E. Lloyd, Vernon Rigby, C. Tovey, and Signor Foli.

This morning Dr. Macfarren's new oratorio *The Resurrection* has been produced. It will not be expected that, writing immediately after the performance to save the post, I should enter into any details on the subject of the new work, especially as it is still unpublished and no opportunity of examining the score has therefore been afforded. I must confine myself to general impressions, deferring to a future occasion any

more elaborate attempt at criticism. The effect produced upon my mind by the whole work was a very favourable one; the choruses strike me, upon a first hearing, as the strongest portions; but the oratorio is a worthy successor to *St. John the Baptist*, to which it seems to me even superior. The performance was on the whole a very good one. The solos were taken by Madame Sherrington, Madame Patey, Mr. E. Lloyd and Mr. Santley. The choruses were exceedingly well sung, and the orchestra accompanied, under the direction of the composer's brother, Mr. Walter Macfarren, with a general refinement which showed only too plainly who was responsible for the painful coarseness which half ruined the performance of *Elijah* yesterday morning. I am very glad to observe that some of our influential daily papers are beginning to speak out plainly on this subject. Nobody, of course, expects in the least to influence Sir Michael Costa; but it is only right that the public, who are mainly led by what they read in the papers, should know where the blame really rests. The oratorio was preceded by a short selection, beginning with what was erroneously described in the programme as Handel's "Occasional Overture," but what was really Sir Michael Costa's *derangement* (not "arrangement") of that work. Mdle. Albani sang most charmingly in Mendelssohn's "Hear my prayer" and Hummel's "Alma Virgo;" and Mr. Stimpson, the organist of the Town Hall, played a trashy organ solo by Lefebure-Wély, which was equally unworthy of the player, the instrument, and the festival.

EBENEZER PROUT.

THE autumnal opera season at Trieste will open with performances of *Lohengrin*; after which Ambrose Thomas's *Hamlet* will be given, Mdme. Volpini sustaining the principal part, in conjunction with Moriani (baritone) and Castlemary (bass). The question of the production next winter of Halévy's opera *Le Val d'Andorre* is under consideration.

FRANZ ERKEL has completed a new opera, entitled *Namenlose Helden*, which will be produced at the National Theatre at Buda Pest some time next winter. The libretto, founded upon an episode in the Hungarian War of Liberation, is written by Edward Toth.

Esmeralda, which obtained so marked a success in Italy last winter, is to be produced at Moscow during the forthcoming season; and, in April next, at Vienna, with Adelina Patti in the principal character.

HEINRICH HOFFMAN is reported to be busy, at Berlin, with a new grand opera.

THE following is a corrected summary of the various engagements made for the approaching Italian Opera Seasons at St. Petersburg and Moscow, under the direction of Gaetano Ferri:—*Prime donne celebrati*, Adelina Patti, Paolina Lucca, Bianca Donadio; *prime donne*, Anna d'Angeri, Maria Heilbron, Carolina Smeroschi, Eugenia Mauduit, Matilde Grabova, Ida Cristofani; *altre prime donne*, Maria Rossetti, Luigia Corsi; *contralti*, Luigia Cary, Ernestina Gindele; *primi tenori*, Ernesto Nicolini, Angelo Masini, Andrea Marin, Achille Corsi, Paolo Lhéris, Oliva Pavan; *altri tenori*, Ignio Corsi, Jago Sabater; *primi baritoni*, Antonio Cologni, Mariano Padilla, Giuseppe Mendioroz, Adriano Strozzi; *primi bassi*, Eraclito Bagagiolo, Giacomo Jamet, Giovanni Capponi, Cesare Bossi; *basso comico*, Giuseppe Ciampi; *comprimari*, Egisto Paltrinieri, Benedetto Marianini, Francesco Raguer, Enrico Fortuna, Giuseppe Cernusco; *direttori d'orchestra*, Giovanni Goula, Enrico Bevignani, Alfonso Dami; *maestri dei cori*, Pasquale Lago, Carlo Corsi, Erennio Gammiero.

A TERM of six weeks' study—the first yet held under the auspices of the Tonic Sol-Fa College—has just been concluded in London. The object has been to collect those engaged in teaching the

tonic sol-fa method, and take advantage of their summer vacation to improve them in the art of teaching, and in general musical knowledge and taste. The students attending this first session were forty in number, of whom five were ladies. Nearly all held appointments as preceptors, organists, teachers of singing under School Boards, in private schools, in choral societies, &c. They came from all parts of the United Kingdom, including London, Manchester, Stornoway, Inverness, Dundee, Aberdeen, Glasgow, Birmingham, Londonderry, South Wales, &c. The principal class, which was attended by nearly all the students, was that under Mr. Curwen, in the art of teaching. This was held daily, the lecturer first expounding principles, and then calling on three of the students, by turn, to give a model lesson either to the students or to a class of children from a neighbouring day-school. In the tonic sol-fa system the difficulties of time, tune, and expression are classified and taught one by one. Each of the students took up one topic for his lesson, and it was afterwards criticised by the lecturer and the other students. Mr. Curwen was assisted in special subjects by various teachers, including Mr. Evans, Music Instructor to the London School Board; the Rev. D. Batchelor; Mr. W. M. Miller, Inspector of Psalmody to the Church of Scotland; Mr. Colin Brown, Lecturer on Music at Anderson's University, Glasgow; Mr. F. Sharp, of Dundee; &c. A voice-training class for men was held daily under Mr. J. Proudman, conductor of the Tonic Sol-Fa Association Prize Choirs. Mr. Curwen had also a class in pronunciation for singers, in which he was assisted by Mr. A. J. Ellis, F.R.S., who prescribed exercises and paid a weekly visit to the class. The Rev. E. P. Cachemaille, Vicar of St. Peter's, Stepney, held a class for the study of the English language and composition. Mr. G. Oakley taught composition. Mr. H. Fisher, Mus. Bac. Cantab., had a class in the theory of fingering for key-board instruments. Mr. Arnold Kennedy, R.A.M., taught the pianoforte, and Mr. W. C. Harris, organist of Highbury Wesleyan Chapel, the harmonium. Mr. W. G. McNaught, R.A.M., taught a class for stringed instruments. Mrs. Stapleton trained the lady students in singing. The term on the whole has been highly successful. Doubts were felt, even by some of the promoters, whether any real progress could be made in so short a time as six weeks. But the examinations held at the close of the term fully decided this question. The quality of the model lessons of the students showed a marked improvement; in voice-training the compass, quality, and power of the voices was very different at the end from what it had been at the beginning. In other departments, also, good work has been done. The students, being sufficiently in earnest to sacrifice their vacation to study, were naturally of diligent habits. A number of them held free scholarships, which had been subscribed by friends of the movement. A second term will be held next year, when a greatly-increased attendance is anticipated.

POSTSCRIPT.

THE family of Sir Isaac Newton is at the present day represented by the Earl of Portsmouth, whose ancestor married a daughter of the philosopher's niece; and a large mass of Newton's manuscripts have been carefully preserved at Hurbourne. We are informed that the noble owner has recently submitted these papers to the inspection of Professor Adams and other Cambridge men of science, with a view of presenting to the University such as are of purely scientific interest.

MR. HENRY CROMPTON has nearly ready for publication, by Messrs. Henry S. King and Co., a work entitled *Industrial Conciliation*. It points out the advantages and disadvantages of the

different systems of arbitration and conciliation, and gives an account of the development of the relations between employers and employed.

The Canon of the Bible: its Formation, History, and Fluctuation, is the title of a work by the Rev. Samuel Davidson, to be published this autumn by the same firm. It is a comprehensive survey of all that concerns the formation and history of the Bible Canon, involving the treatment of such questions as the inspiration, authenticity, authority and age of the Scriptures.

AN attempt is being made by the inhabitants of Greenwich to get back into their hands four royal portraits—of Elizabeth, Charles I., Anne, and George I.—which formerly hung in their parish church of St. Alphege. For some years they were stowed away in the organ-loft as lumber, and eventually sold by the churchwardens. The portrait of Queen Anne was bought for 10*l.* by the Commissioners of Greenwich Hospital; the others came into the possession of a firm in New Bond Street for the sum of 23*l.* 5*s.* That of Charles I. is ten feet square, and is supposed to be an early work of Sir Peter Lely. George I. is represented in full coronation robes; in the background is a view of the south end of Westminster Abbey.

THE Early English Text Society's Extra Series this year is to mix its *Guy* romance and *Brus* romantic history with some Roman Catholic theology. Prof. J. E. B. Mayor, of St. John's College, Cambridge, has sent to press for the Society the first part of his collected edition—the first ever made—of the English writings of the famous Cardinal or Bishop Fisher, who was Lady Margaret Derby's Confessor, and persuaded her to found St. John's and Christ's at Cambridge. Prof. Mayor's edition will contain:—1. The Seven Penitential Psalms, 1508; 2. The Funeral Sermons on Henry VII., and his Mother, Lady Margaret, 1509; 3. The Sermon at Paules Crosse, 1521 (on the burning of Martin Luther's books); 4. A Spiritual Consolation to his Sister Elizabeth, at such time as he was Prisoner in the Tower, 1535; 5. All such English Letters and Papers as can be Recovered; with an Introduction, Notes, and full Glossary. Prof. Mayor will present to the Society autotypes of the very quaint and interesting title-page of the Wynkyn-de-Worde edition of the Luther Sermon of 1521, and also of the handsome printer's device at the end of it.

A COLLECTED edition of the poems of Ebenezer Elliott, "the Corn Law Rhymers," in two volumes, is being prepared for publication by Messrs. Henry S. King and Co., under the editorship of his son, the Rev. Edwin Elliott, of St. John's, Antigua. It will contain a steel engraving of the tomb and statue erected to his memory by the working men of Sheffield.

Rays from the Southern Cross is the title of a volume of poems written by a lady who has resided for many years in New Zealand. It will be profusely illustrated by the Rev. P. Walsh, of Tasmania. Among other volumes of poetry which are announced for autumn publication by Messrs. Henry S. King and Co., we may mention *St. Malo's Quest*, by the Rev. John Adams; *Poems*, by Henry Weybridge Ferris, and by Prof. E. Dowden; and a volume of sonnets entitled *Annus Amoris*, by Mr. J. W. Inchbold, the well-known artist, which will be embellished with a special design by the author, both for the cover and the frontispiece.

A FEW days ago the "Historische Verein" of St. Gallen held its yearly assembly at Uznach. In conjunction with the members of the Zürich "Antiquarische Gesellschaft," an excursion was made into the Gasterland, and a digging was opened within the walls surrounding the old Roman Wartthurm (*Speculum*) on the Biberlikopf over Weesen. Nothing was found beyond a mass of potsherds of larger and smaller vessels, and broken fragments of wine-pitchers.

SATURDAY, SEPTEMBER 9, 1876.

No. 227, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Daniel Deronda. By George Eliot. (Edinburgh and London: W. Blackwood & Sons, 1876.)

INDEPENDENTLY of its interest as a mere story and as a vehicle for reflections, *Daniel Deronda* is eminently interesting, because it presents in a fresh and brilliant light the merits as well as the faults of its writer—merits and faults which are here sharply accentuated, and are not, as is too frequently the case, blurred and confused by the wearing of the plate. Both classes of peculiarities should be by this time pretty well known to the student of English letters. On the one hand, we are prepared to find, and we do find, an extraordinarily sustained and competent grasp of certain phases of character; a capacity of rendering minute effects of light and shade, attitudes, transient moods of mind, complex feelings and the like, which is simply unparalleled in any other prose writer; an aptitude for minting sharply ethical maxims; and a wonderful sympathy with humanity, so far, at least, as it is congenial to the writer. On the wrong side of the account must be placed a tendency to talk about personages instead of allowing them to develop themselves, a somewhat lavish profusion of sententious utterance, a preference for technical terms in lieu of the common dialect which is the fitter language of the novelist, and a proneness to rank certain debateable positions and one-sided points of view among the truths to which it is safe to demand universal assent. To this black list must be added some decided faults in style. In discussing a book which is in everybody's hands, it will be well to show how the above points are brought out, and how they affect the general merit of the book, rather than to indulge in superfluous description of the plot.

In the matter of character, then, we find two signal triumphs of portraiture. The part of Gwendolen Harleth is throughout an overwhelming success: and the minutest and least friendly examination will hardly discover a false note or a dropped stitch. Her self-willed youth; the curious counterfeits of superiority in intellect and character, which her self-confidence and her ignorance of control temporarily give her; her instant surrender at the touch of material discomfort; the collapse of her confidence in the presence of a stronger spirit; the helpless outbursts of self-pity, of rage, of supplication, which follow that collapse; the struggle between blind hatred and almost equally blind glimmerings of conscience; the torrent

of remorse and final prostration of will—are all imagined with a firmness, and succeed each other with an undoubted right of sequence, which cannot but command admiration. The husband is almost equally admirable; indeed, one's admiration is here increased by the perception that the hand which is so faithful is distinctly unfriendly, and that the author would like us to detest Grandcourt. Yet there is not the slightest exaggeration in the portrait, as he appears before us, acting with strict politeness to his wife, in no way violent towards her (if we except the occasional use of somewhat forcible language), and employing, for the purposes of his refined tyranny, nothing stronger than the methods of "awful rule and right supremacy." If he should appear to anyone all the more detestable, it may be suggested that it is difficult for any husband to extricate himself handsomely from the position of being hated by his wife and having that hatred confided to a bewitching rival.

The more study we give to these wonderful creations the better we like them, and an additional interest is imparted by the discovery that Gwendolen is at heart a counterfoil of Dorothea, animated by an undisciplined egotism instead of an undisciplined altruism, and by the fanaticism of enjoyment instead of the fanaticism of sympathy. It might even suggest itself to a symmetrical imagination that the soul of Casaubon clothed with the circumstances and temperament of a fine gentleman would animate just such a personage as Grandcourt. But these are fancies. The point of present importance is that the interest of the story undoubtedly tends to centre in these two admirable characters and is unfortunately not allowed to do so. Of the third (according to the author's design, the first) personage we cannot speak as we have just spoken. The blameless young man of faultless feature who clutches his coat-collar continually; who at the age of some twenty years wished "to get rid of a merely English attitude in studies;" who, in the words of his best friend, was disposed "to take an antediluvian point of view lest he should do injustice to the megatherium;" of whom it was impossible to believe, in the still more graphic words of the friend's sister, "that he had a tailor's bill and used boot-hooks;" who never does a wicked thing, and never says one that is not priggish—is a person so intolerably dreadful that we not only dislike, but refuse to admit him as possible. Only once, perhaps, is he human—when he persuades himself on all sorts of ethico-physico-historical grounds that he should like to be a Jew, solely because (as that very sensible woman his mother, the Princess, discovers at once) he wishes to marry a fascinating Jewess. We cannot accept as an excuse for the selection of this "faultless monster" as hero the pleas put forward in the book that it is only the "average man" and the "dull man" that will not understand him, and that the average man is not very clear about the "structure of his own retina," and the dull man's "dullness subsists, notwithstanding his lack of belief in it." In the first place, the cases are not parallel: for, though the average man may know very little about the structure of his retina, he

can tell a real eye from a glass one well enough. And, in the second place, the dull man may fairly retort, "If you are a great novelist, make me believe in your characters."

In this dearth, or rather distortion, of central interest, the minor characters do not help us much. They are far less individual, and far less elaborate than is usual with George Eliot. *Daniel Deronda* does not supply a fifth to join the noble quartette of *Mdmes. Holt* and *Cadwallader*, *Poyser* and *Glegg*. Sir Hugo Mallinger, with *Hans Meyrick* and his sister *Mab*, makes a shift to fill up the gap, but it is but a shift. *Lapidoth*, the unwelcome father, is chiefly welcome to us, the readers, because of the happy boldness of the incident which finally unites the lovers. *Mordecai* we must not, we suppose, call a minor character, but of him more hereafter.

There is no lack in these volumes of the exquisite cabinet pictures to which George Eliot has accustomed us. The account of Gwendolen's "grounds of confidence;" the charming etching of the waggon passing *Pennicote Rectory*; the scene of the first ride with Grandcourt; Gwendolen, after *Klesmer* has crushed her hopes of artistic success, and again immediately before she at last accepts her lover; the wonderful sketch of Grandcourt "sitting meditatively on a sofa and abstaining from literature;" *Deronda* in the synagogue; the stables at the Abbey; the waiting at *Genoa* for the Princess; and lastly, Gwendolen's retrospect of *Offendene*—are all effects of the finest in this kind. But this good gift and other good gifts have been somewhat repressed, as it seems to us, in order that certain tendencies not so excellent in themselves, and very much the reverse of excellent when inordinately indulged, might have freer play. No one can read *Daniel Deronda* without perceiving and regretting the singular way in which the characters are incessantly pushed back in order that the author may talk about them and about everything in heaven and earth while the action stands still. Very sparingly used this practice is not ineffective, but the unsparing use of it is certainly bad, especially when we consider in what kind of language these parabases or excursions are expressed. We cannot away (in a novel) with "emotive memory" and "dynamic quality," with "hymning of cancerous vices" and keenly perceptive sympathetic emotiveness," with "coercive types" and "spiritual perpetuation," still less with hundreds of phrases less quotable because bulkier. No doubt many of these expressions are appropriate enough, and they are all more or less intelligible to decently-educated people. No doubt the truths of science, mental and physical, are here, as elsewhere in our author's works, rendered with astonishing correctness and facility. But it appears to us that the technical language of psychology is as much out of place in prose fiction as illustration of its facts is appropriate. In philosophy, in politics, in religion, in art, a novelist, when he speaks in his own person, should have no opinion, should be of no sect, should indulge in no *argot*.

If we are dissatisfied with the Jewish episode which is so remarkable in this book,

it is not merely because it has supplied temptations to indulge in psychological disquisition. We do not in the slightest degree feel "imperfect sympathy" with Jews, and we hold that Shylock had the best of the argument. But the question here is whether the phase of Judaism now exhibited, the mystical enthusiasm for race and nation, has sufficient connexion with broad human feeling to be stuff for prose fiction to handle. We think that it has not, and we are not to be converted by references to the "average man." The average man has never experienced the passion of Hamlet, of Othello, or of Lear; he is not capable of the chivalry of Esmond, of the devotion of Des Grieux, of the charity of the Vicar of Wakefield. But he has experienced, and he is capable of, something of which all these sublime instances are merely exalted forms. Now the "Samo-thracian mysteries of bottled moonshine" (to borrow a phrase from *Alton Locke*) into which Mordecai initiates Deronda are not thus connected with anything broadly human. They are not only "will-worship," but they have a provincial character which excludes fellow feeling. Poetry could legitimately treat them; indeed, many of Mordecai's traits may be recognised,—as we think, more happily placed—in the Sephardo of *The Spanish Gypsy*. They are, no doubt, interesting historically; they throw light on the character and aspirations of a curious people, and supply an admirable subject for a scientific monograph. But for all this they are not the stuff of which the main interest or even a prominent interest, or anything but a very carefully reduced side interest, of prose novels should be wrought. It is hardly necessary to say that this dissatisfaction with the manner and scale of his appearances does not blind us to the skill applied in the construction of Mordecai. Probably no other living writer is capable of the patient care with which these intricate and unfamiliar paths are followed; certainly no other is master of the pathos which half reconciles the reluctant critic. If the thing was to be done, it could hardly have been done better, assuredly it could not have been done with greater cunning of analysis or in a manner more suggestive.

We should have no right to complain that to the simplicity and passion which characterise the subjects and situations of the author's earlier books there has succeeded something more complex and analytic in the present: it is a time-honoured transition, and one which has before now yielded excellent results. But in reality the transition is not in this case great, because the subject-matter really remains the same although there may be somewhat less directness of treatment. The book is little more than a fresh variation on the theme which has informed so much of George Eliot's work, which lurks even in the *Scenes of Clerical Life*, which is hardly in abeyance in *Adam Bede*, which is the professed motive of *The Mill on the Floss*, of *The Spanish Gypsy*, and of *Romola*, which gives charm to the slightness of *Silas Marner*—to wit, the excellence of obeying the instigations of kinship and duty rather than the op-

posing instinct, "All for Love and the World well Lost." Perhaps the motive has hardly depth and volume enough to bear such constant application. But this is matter of opinion. The matter of fact remains, that we have once more presented to us in the contrast between Gwendolen's misery and the prosperity of the sleek Deronda the same moral as we had in Hetty's catastrophe, in the fate which punished Maggie Tulliver's partial declension from the standard, in the ruin and disgrace that sprang from Duke Silva's passion, in the degradation and death of Tito Melema; the same theories which led to the sympathetic selection of Felix Holt for a hero and of Dorothea Brooke for a heroine. The moral, and the standard, and the theories are doubtless of a fine severity, and deal deserved rebuke to the lax pleasure-seeking which has been considered a vice at all times, and is not openly considered a virtue even yet. In the illustrations of these doctrines the author has again given us admirable portraits, and much exquisitely-drawn surrounding. But perhaps she has also once more illustrated the immutable law that no perfect novel can ever be written in designed illustration of a theory, whether moral or immoral, and that art, like Atticus and the Turk, will bear no rival near the throne.

GEORGE SAINTSBURY.

Islam under the Arabs. By Robert Durie Osborn, Major, Bengal Staff Corps. (London: Longmans, 1876.)

THE task that Major Osborn has set himself is one abounding in interest and importance. He proposes to write a history of the Mohammadan religion; and *Islam under the Arabs* is his first instalment. The turns and windings of Islām are as curious as those of Christianity. People in England are apt to fancy all Muslims alike, and if we succeeded in eliciting their private ideas on the subject we should in all probability arrive at a picture of a fanatic in a turban, believing in Allah, leading a life by no means remarkable for morality, and looking forward to continuing his debauchery in the next world; much given to fatalism and to smoking long pipes. Yet the varieties of life and opinions among Mohammadans are as numerous as can well be imagined. The opposition between Protestant and Catholic, Armenian and Calvinist, Trinitarian and Unitarian, is perfect harmony compared with the divergence in creed between some of the sects of Islam. It is singular that no attempt should hitherto have been made in England to trace the growth and character of these various sects. The materials are not very far to seek, and are open to any qualified Oriental scholar. In Germany a step towards this has been made in the translation of Esh-Shahrastāni's treatise on the Sects and in Dr. Goldziher's labours. But in England nothing had been done worthy of the subject until Major Osborn came to break the ice.

In some respects *Islam under the Arabs* is admirably fitted to fill the place thus left vacant for it; in others it is disappointing.

It possesses the not too common merit of an easy and seductive style, very forcible where strength is needed; and a vast amount of very interesting information is conveyed in the least fatiguing manner possible. But on the other hand must be noted a total absence of method and arrangement, and a diffuseness and reluctance to stick to the point, which, while it contributes to the readableness of the book, unquestionably debars it from assuming the position of an authoritative history of Islām. To judge, also, from the list of authorities—in many respects a good one—and from the extraordinary spelling of Arabic words in which Major Osborn occasionally indulges (*e.g.*, *Ansars*, *Djinnis*, both of which are plurals without an English *s* at the end; *Dzul-Hajj*, &c.), we should think that the author was a Persian rather than an Arabic scholar; and, although much may be read in translations, the writer of an authoritative history of the Mohammadan religion must be on more intimate terms with the Arabic originals, and must refer to many works that are as yet untranslated. Major Osborn has hardly mended matters by putting his list of authors at the end of the volume and omitting all references at the foot of each page. In a subject such as this we must have the sources for each important statement if that statement is to be taken as fact. The truth is, in every work of this class a writer has to choose between two alternatives: his book may be scientific or popular. In the former case it is authoritative, but generally unreadable except by specialists; whereas the popular treatise must be interesting, and will command a much larger circle of readers. Major Osborn has chosen the latter course; and it is as a popular book alone that it should be criticised. Taking this view, one can have no hesitation in saying that it is not only eminently readable, but thoroughly worth reading. Major Osborn has evidently worked long and patiently at the subject, and his results may, as a rule, be trusted; though of course, when we come to opinion, there are some points with which many will not agree.

The book is divided into three parts. In the first, an account is given of the early Theists of Arabia, from whom Mohammad learned the fundamental doctrine of his creed. Then the Prophet's career is sketched with a view to determining the original character of Islām; and the history is carried on to the great schism between the followers of 'Alī and the house of Umayyeh. The latter portion of this first part is more satisfactory than the earlier chapters. The contests between 'Alī and his opponents, and the origin of the Khārijis or Separatists, are vigorously told. But the chapters relating to Mohammad himself are of too fragmentary a nature for the importance of the subject. There is much in Major Osborn's view of the Prophet of Islām that is both original and probable; but there is also a constant vein of depreciation, an undue weight assigned to those acts and sayings that are discreditable to the memory of Mohammad, and an unintentional suppression of those heroic qualities which by their brightness throw into shadow the worse side of his character. Thus the cruelties

attributed to Mohammad are enlarged upon at great length, while the bloodless entry into Mekka, one of the finest episodes in the Prophet's career, and one to which history can hardly supply a parallel, is recorded without comment, except the quite uncalled-for remark that Mohammad treated the inhabitants with "politic clemency." The same bias may be noticed in many places: in the exaggerated and mistaken estimate of Mohammad's fatalist doctrine, the assumption of a conscious invention of *Súrah's*, the omission of the palliating circumstances of the Prophet's sensuality, and the attribution to him of the evils of polygamy—about as reasonable a charge as making Christianity or Judaism responsible for slavery. It is idle to accumulate instances. We shall merely quote Major Osborn's summary of Mohammad's character, of which about one quarter is perhaps true:—

"It is as the founder of a creed that Muhammad becomes a figure of world-wide significance, demanding and needing careful examination. As such he has been fiercely attacked, and of late years has been eulogised with almost equal extravagance. Of the sincerity of his belief in his own mission there can be no doubt. The great merit is his that among a people given up to idolatry he rose to a vivid perception of the Unity of God, and preached this great doctrine with firmness and constancy, amid ridicule and persecution. But there, it seems to me, the eulogy of the Prophet ought to cease. When tried by the test of prosperity his character lost its moral grandeur, his creed its spiritual elevation. At Medina the religious teacher is superseded by the ambitious politician, and the idols of the Kaaba fall before the mandate of the successful chieftain, not under the transforming influences of a spiritual regenerator. To achieve worldly dominion he has recourse to assassination; he perpetrates massacre; he makes a heathen superstition the keystone of his faith; and delivers to his followers, as a revelation from God, a mandate of universal war. With every advance of worldly power, he disencumbers himself of that spiritual humility which was a part of his earlier faith. He associates himself with God on a footing approaching equality. The angels, he declares, pray for blessings on the head of the Prophet. Disobedience to the Prophet is punished by hell-fire precisely as is disobedience to God. The names of God and his Apostle are linked together as those of beings who have equal claims upon the love and submission of men. The Apostle becomes a creature so exalted that even the easy drapery of Muhammadan morality becomes a garment too tight-fitting for him. 'A peculiar privilege is granted to him above the rest of believers.' He may multiply his wives without stint; he may, and he does, marry within the prohibited degrees" (pp. 90 f.).

This is the old story, and has been answered over and over again.

In the second part Major Osborn proceeds with the history of the *Shi'is* (or *Shias*, as he calls them). The first chapter of this division, in which the tenets of the *Ismá'ilis* are described, will probably astonish those readers who know only of orthodox Mohammadanism. The introduction of *Khárijí* and *Ismá'ilí* doctrines into Northern Africa, the rise of the *Fátimis* and their conquest of Egypt, are graphically told; and the part ends with an account of the mad *Khalifeh El-Hákim*, and the origin of the sect of the *Assassins*. The third part takes up the history of the *Sunnis* or Orthodox party where it was left off in the

first, and carries it down to the overthrow of the House of *Umayyeh*, and the establishment of the '*Abbási Khalifehs*. Like the second part, this is well written and full of interest, arising both from the nature of the subject and the manner in which it is treated. One of the characteristics of Major Osborn's style is a vein of quiet humour and good-natured irony. He evidently appreciates the grave irony of the *Arabian Nights*, and he has introduced some anecdotes of the true Eastern breed. One of these is particularly charming:—

"When *Ibn-Khattan*, the Poet, was sitting down to dinner with his wife, he told her to uncover her head. When she did so, he repeated these words of the *Koran*: *Say God is one*. She asked him what was the matter, and received this answer: 'When a woman uncovers her head, the angels do not remain present; and when that verse of the *Koran* is pronounced, the demons take to flight. Now, I do not like being at table with a crowd about me'" (pp. 173 f.).

Islam under the Arabs certainly deserves popularity; and with the power of description and narration that it displays, it seems tolerably sure of success. We are curious to learn what Major Osborn will say in his second and third volumes about *Islam* under the Persians and the Turks. To judge from present events, he will find Turkish *Islam* a troublesome question.

STANLEY LANE POOLE.

RALPH OF COGGESHALL'S ENGLISH CHRONICLE.

Radulphi de Coggeshall Chronicon Anglicanum. Ed. Jos. Stevenson. Rolls Series. (London: Longmans & Co., 1875.)

THIS volume forms a natural appendix to the *Chronicles and Memorials of the Reign of Richard I.*, already edited in the same series by Prof. Stubbs. Ralph was abbot of Coggeshall from 1207 to 1218, when he resigned through ill-health (p. 187), and apparently devoted his leisure time to the compilation of his book. He says himself, p. 162:—"(1207) Thomas, fifth abbot of Coggeshall, died, and was succeeded by Ralph, a monk of the same place, who wrote this chronicle from the capture of the Holy Cross"—by Saladin at the battle of *Tiberias*, 1187—"to the eleventh year of King Henry III., the son of King John, and added a faithful account of some visions which he heard from venerable men, for the edification of many." Thus the work was carried down to 1227, but the manuscript ends in 1224 with the expulsion of *Fawkes de Breauté*—"qui Falco cognominatus est a falce qua occiderat militem in prato patris sui in Normannia" (p. 204). The passage in p. 74, "*tertius hostis*," must have been written before the death of Philip Augustus in 1223. Of John's despatch giving an account of his success at *Mirabel*, where Arthur was taken prisoner by his uncle, Mr. Stevenson says that no other copy is known to exist. Select annals from the time of the Norman Conquest are also prefixed to Abbot Ralph's own Chronicle. The book, therefore, does not quite correspond with its author's own description of it. The Abbey of Coggeshall, in Essex, was founded by Stephen and his wife,

Matilda, in 1140 (p. 11; others say 1137), thirteen years after the premier Cistercian Abbey of *Furness*, also founded by Stephen and Matilda. A pedigree of Cistercian abbeys in England is given in the Rev. M. C. Walcott's paper read before the Institute of British Architects, January 31, 1876, on the Abbey of *St. Mary*, in the Vale of *Flowers*, *Cleeve*, *Somersetshire*, and since printed, which is very useful for reference. Coggeshall itself was a daughter of the famous Abbey of *Savigni*, in the diocese of *Avranches*. In p. 133 Ralph speaks of some abbeys in Spain adopting the Cistercian rule "as the house at *Savigni* formerly did," and (p. 184) he quotes an account from John of *Savigni* about the great storm of wind at *Newark* during which King John's soul passed away. Another Essex abbey, *Tilty*, is mentioned several times (pp. 14, 169, 177—in the last of which places its plunder by John's mercenaries is mentioned). *Tilty* was not a daughter of *Savigni*; but *Stratford* was, and *Benedict* of *Stratford* succeeded Abbot Ralph himself (p. 187). Abbot Ralph naturally does not mention the tale that John was poisoned by a Cistercian monk at *Swineshead*; but this may be a later story (it occurs in *Wikes* and *Hemingburgh*), due to the invention of rival orders. The monastic orders were mostly jealous of each other. Even the Cistercians had rapidly declined. They had once called the Benedictines "*tepid*;" now they were themselves accused of avarice. When *Fulk* of *Neilly* (who preached the third crusade, as is here described at length) exhorted *Richard Cœur de Lion* to provide for his three daughters, *Pride*, *Avarice*, and *Lust*, *Richard* is said to have answered (*Hoveden* iv., p. 77), "I give my pride to the Templars, my avarice to the Cistercians, and my lust to the prelates." The Cistercians appear in this book engaged in a great struggle to pay no taxes either to King John or to Pope *Innocent III.* The Pope was warned in a vision seen by the monk *Reiner*, to whom the Virgin Mary appeared and said that the Cistercians were more pleasing to her than any other monks—"filios carissimos, in quibus solis super omnes alios religiosos sibi bene complacet" (p. 132). Readers of *Milman* (Bk. ix., ch. ix., at the end) will remember that the Dominicans made at least equal claims. It is curious that Ralph does not mention the rival orders. Archbishop *Hubert* reconciled the Cistercians with John, and hence the Chronicle gives at length the touching and picturesque circumstances of the Archbishop's death. It is noticed that his bed was of straw: "*de stramine proprii lecti quibus forte stramenta deerant, disperitiens*." But some had visions of him as in torment after death. Nor did the later Cistercian churches correspond to the primitive poverty professed by them in accordance with *St. Bernard's* views, who regarded as Judaical "the vast height of churches, the idle waste of space, their sumptuous glistening smoothness, and curious decking with colours."

Besides the edifying "visions" promised by Abbot Ralph, of which the monk *Reiner's* is a specimen, we have two collective sets of stories (pp. 117-128, 197-203). Several

of them illustrate the popular beliefs of the Eastern counties. A merman was taken at Orford in Henry II.'s time, who may have been "aliquis malignus spiritus in aliquo corpore submarini hominis latitans, sicut de quodam legitur in vita beati Audoeni." At Woolpit a green-coloured boy and girl came out of a cave, who belonged to the people that live under the earth, where the sun is not seen, but "quadam claritate fruebantur, sicut post solis occasum contingit." While tending their flocks they had gone into a cavern, and had followed a sweet sound of bells ringing till they came out into the upper air. At Dagworth a child-spirit, called Malekin, haunted a house and talked English with the family, "secundum idioma regionis illius;" it sometimes talked Latin, and discussed Scripture with the chaplain—as the latter himself told Ralph—once she appeared to a little girl in the shape of a tiny infant clad in white. She and her friends kept themselves invisible by means of a certain cap. In p. 134 a story is inserted about some mysterious visitors to Coggeshall itself, who suddenly disappeared. The stories seem to be inserted here and there as a relief after more serious matter, just as in William of Malmesbury.

But the most important pieces in the *Chronicle* are those contributed by eye-witnesses of Richard's crusade who happened to visit Coggeshall. Thus Hugh de Neville described the conflict between Richard and the Saracens at Joppa, in which he had himself taken a share (p. 45). We know from the *Itinerarium* (p. 415) that Hugh was there, and "the details are so minute and characteristic as to mark the result of personal observation—e.g., the notice of the fact that at this time there were in Richard's force only six horses and one mule." The *Itinerarium* gives the names of Hugh and Richard's nine other comrades, and says "Hi tantum equos habebant, et quidam equos quidem ignobiles et debiles, armis inassuetos." The strikingly minute and picturesque details of Richard's capture on his way home from Palestine are given on the authority of Anselm, the chaplain, one of the little party which accompanied the king in his ill-advised journey through Germany (p. 55)—"Anselmus capellanus, qui haec omnia nobis, ut vidit et audivit, retulit." The Lambeth MS. 371 (to which Mr. Stevenson makes no reference) inserts here, after *capellanus*, "gestorum regis assertor et testis"—see Prof. Stubbs' preface to the *Itinerarium*, p. xxxv., *seq.*, where there is a full discussion as to the historians of the Crusade and their authorities, to which we are somewhat surprised that Mr. Stevenson has made no reference. There are other indications that the book has been published without the opportunity of a final revision. Probably the editor has been prevented by the researches which he is carrying out at the Vatican from putting the finishing hand to his work. The account given of the chief MS. in the preface (p. xiv.) is good and instructive, as showing how new matter was inserted from time to time by adding separate pieces of parchment, by erasing a passage and writing a fuller account in a smaller and more compressed hand, by marginal notes and so on; this shows "that

the author's autograph copy has come down to us." In the notes, however, various readings are inserted from H and V. V is of course the Paris MS., once belonging to the Abbey of St. Victor, from which Martene printed his text; but what MS. is denoted by H is nowhere stated. Is it that in the College of Arms, noticed in Sir T. D. Hardy's *Descriptive Catalogue of Materials*, iii., p. 65? Mr. Stevenson's text seems to have been printed some years, as the marginal analysis now usually given in this series of works only begins with the tract "De Expugnacione Terrae Sanctae per Saladinum," which is printed next after the text of Coggeshall. This tract has been sometimes assigned to Coggeshall himself; but the tone is utterly unlike. It is full of sermonising expressions, and was written by a partisan of the Count of Tripoli. The defeat of the Christians at Tiberias is ascribed to the Christians neglecting his advice to stand on the defensive and let the enemy advance over a waterless region; instead of which the Christians advanced over it and fought in a thoroughly exhausted state—the light-armed having fled owing to their parching thirst, and so left the heavy-armed exposed to the fatal Turkish arrows. The tract was written by one who was at the siege of Jerusalem by Saladin (pp. 230, 245), was wounded by an arrow in the nose, and retained the iron in his flesh at the time of writing. The tract itself ends with the account of the spoiliations of the Holy Sepulchre, and here on the margin of the Cotton MS. we read "Ricardus explicit;" but another hand has added some particulars of the siege of Acre, and given the letters of the Emperor Frederick and of Saladin. These are merely extracts from the *Itinerarium*; compare, for instance, the first words, "civitatem Jerusalem circiter octoginta novem annis," with *Itin.* p. 22. It is in this set of extracts from the *Itinerarium* that the important passage occurs, "If any one desires to know all this more fully, let him read the book of which the Prior of the Holy Trinity in London had an elegant and truthful translation made from French into Latin." Now, Trivet says that Richard, canon of the Holy Trinity, wrote the *Itinerarium*, "prosa et metro, secundum ea quae ut ipse asserit praesens vidit in castris." The poem was still extant in Leland's time, but only the prose *Itinerarium* is now known to exist, which, however, has many scraps of verse in it. Professor Stubbs doubts the work having been a translation from the French. An announcement, however, has been lately made that MM. Gabriel Monod and G. Paris are preparing for publication an octosyllabic poem on the Third Crusade, in which they believe they recognise the original of Prior Richard's work. The comparison will be highly curious and instructive. If this is the case, Richard probably translated the French poem first into Latin poetry, and then into prose; the prose still contains many traces of the poetry, and not unfrequent quotations, e.g. :—

"Tunc Marchisum execrantur
Pacti transgressorium;
Huic et malum imprecantur
Et vae peremptorium."

which may be a translation from similar short French verses. The note "Ricardus explicit," quoted above, may have been meant as a reference to Prior Richard, as if he had written the "De Expugnacione Terrae Sanctae."

Thirdly, Mr. Stevenson has given "Magistri Thomae Agnelli, Wellensis archidiaconi, sermo de morte et sepultura Henrici Regis junioris," which is a rather feeling account of young Henry's death and burial. Can the phenomenon described on p. 268 have possibly been the Zodiacal Light—"an hour before dawn a column of wondrous light appeared"? The time being summer may, however, make this improbable.

Fourthly, comes the French romance of Fulk Fitzwarin, which appears to be a prose adaptation of a poem; and here, again, portions of the verse remain imbedded in the prose. It should have been noticed in the preface that it has been published three times previously, and that Leland gives an abstract of the story from both English and French rhymes (Hardy's *Catalogue*, iii. p. 41).

Lastly, we have some extracts from the *Otia Imperialia* of Gervase of Tilbury, in Essex, a work dedicated to Richard's nephew, the Emperor Otto IV. The extracts give his account of Great Britain and Ireland, with a short sketch of the kings down to John; besides which a few more extracts are added to the preface. Of Gervase himself an anecdote is given by Ralph of Coggeshall, p. 122, which is anything but creditable to him, but it contains an excellent witch-story :—

"De sinu concite glorum fili extraxit, et extra quandam magnam fenestram projecit, capite fili in manibus retento, cunctisque audientibus voce sonora dixit 'Recipe.' Ad quod verbum mox a terris elevata, glorum agili volatu cunctis aspicientibus extra fenestram subsecuta est, malignorum spirituum ministerio ut credimus subvecta, qui quondam Simonem Magum in aere sustulerunt."

We see that the legend of the Clementines was as rife in Abbot Ralph's time as it had been in that of Aldhelm, who uses "the tonsure of Simon Magus" as an argument against the Celtic Church.

C. W. BOASE.

The Two Chancellors. By M. Julian Klaczko. Translated from the French by Mrs. Tait. (London: Chapman & Hall, 1876.)

M. KLACZKO is a Pole who has served in the Austrian Foreign Office, and writes in the somewhat Orleanist *Revue des Deux Mondes*. These three circumstances enable us to guess pretty accurately what sort of judgment he has pronounced on "the Two Chancellors"—Prince Gortchakoff and Prince Bismarck. A Russian, consequently an unfriendly, critic attributes to M. Klaczko the boast "En faisant de l'actualité j'ai fait de l'histoire." Reading *The Two Chancellors* we are tempted to invert the phrase, and say that under the pretence of writing a biographical history he has given us a political pamphlet. While the book was coming out in the pages of the *Revue des Deux Mondes*, it was not unfavourably characterised by another unfriendly critic, M. Benedetti, as an "histoire anec-

dotique." It is obvious that this form of composition is admirably adapted to M. Klaczko's purpose. Given two diplomatists, both of them utterers of good things, neither of them too candid or too reticent or too consistent for his profession, it is required to make such a selection of their sayings and doings as shall convince a majority of readers of the justness of the author's appreciation of the present and previsions of the future. The conclusion to which M. Klaczko would have his readers arrive is that Prince Gortchakoff has sacrificed the true interests of his country to an impolitic spite against Austria and an equally impolitic tenderness for Prince Bismarck. To discuss the justness of these conclusions would take us too far into the forbidden field of politics. But we cannot but admire the art with which the writer supports his thesis by quotations from M. Benedetti's reports to the French Government (1868-70)—reports written, of course, without any direct reference to the interests of Russia.

The book is written too obviously for the purpose of supporting the conclusion just stated to be a perfectly fair, much less a complete, history of the period of which it treats. In one respect biographers of living statesmen occupy a position which is not without its disadvantages. It is often inconvenient for them to tell the reader how this or that detail has come to their knowledge. The reader has thus to confide, not merely in the good faith of the biographer, but also in his judgment. Now one or two of the stories in the book before us are perhaps too readily accepted by our author because they make so much for his case. The well-known "Indian Official," Colonel Sleeman, reports in one of his books a conversation with a talukdar of Oude, who maintained that "as soon as a sovereign said that his belly was full he was sure to be destroyed by his neighbours." This seemed to Colonel Sleeman so specifically Indian that he explains for the benefit of the European reader how such a conclusion had been arrived at. In M. Klaczko's book, however, we find a European statesman expressing the same opinion as the talukdar. M. de Bismarck, we are told, explained in a "private conversation" that he had ceased to take England into account from the day she ceded the Ionian Islands. "Une puissance qui cesse de prendre et qui commence à rendre est une puissance finie." If some English politician were to write a book advocating an alliance on our part with Germany he might perhaps select among the "winged words" of Prince Bismarck a more flattering appreciation of England as a Great Power. Another private conversation of the terrible Chancellor is reported so much in the by-the-way style that we cannot help wishing for a more detailed account. M. de Bismarck, so the story goes, when about to quit his post as representative of Prussia at the Russian Court, received the visit of a colleague, a foreign diplomatist. To him the future Chancellor of Germany said:—"When I leave a country in which I have sojourned for any length of time, I dedicate to it one of the trinkets on my watch chain, on which I have engraven my final impression of the country; would you like to know

my final impression of Russia?" The puzzled diplomatist read on the trinket presented to his view, "*La Russie, c'est le néant.*" This story, told in a foot-note, is really too tantalising. On reading it we can only exclaim with sceptical curiosity, "*Que trompet-on ici?*"

Of course, M. Klaczko exaggerates the influence of individuals on the course of events—notably that exercised by his two heroes. This is a fault natural to all biographers. But the book before us seems to have been cast in the form of a dual biography in order to give ample scope for such exaggeration of individual influence. Indeed, as the book is in effect an indictment of A. for having aided and abetted B. in the commission of such and such crimes, the counsel for the prosecution keeps as much as possible in the background the circumstances that facilitated their commission and might possibly be held to mitigate their criminality. Still, M. Klaczko is not always consistent in his philosophy. When he looks back on the past he writes: "Take away from the recent history of Prussia the three or four men who answer to the names of William I., Moltke, Roon, and Bismarck, and old Barbarossa might still be sleeping his sleep of ages in the caverns of the Kyffhauser." But when he contemplates a future war between Russia and Germany, in spite of the ties of friendship and kinship that unite their reigning houses, he tells us that "there exists a mightier power in the world than that of Czar or Emperor—the stern force of circumstances, the overmastering necessities of race." Just so; and we may add that the fact that the Frankfort Diet offered the Imperial Crown of Germany to a King of Prussia while William I., Moltke, Roon, and Bismarck were as yet unknown to fame is in itself a sufficient answer to M. Klaczko's pretty sentence about the long sleep of Barbarossa.

There is no point in the careers of the two Chancellors on which our author dwells so long, or to which he returns so often, as the inconsistency between their earlier and their later policies. Prince Gortchakoff, to whom the Emperor Nicholas had entrusted the interests of his daughter, Queen Olga of Würtemberg, afterwards favoured a policy which has reduced her to the rank of a vassal of the Hohenzollerns. Prince Bismarck first rose to notice as a passionate advocate of Austria, and lived to deal that same power the well-known "*Stoss im Herzen.*" The same Bismarck, who, while only "the eccentric and impetuous Knight of the Mark," had stigmatised the intervention in the "sea-girt" Duchies as "an eminently iniquitous, frivolous, disastrous and revolutionary enterprise," was destined, as the chief minister of Prussia to carry out that enterprise with complete success. Of course these inconsistencies, real or apparent, form a tempting theme for an epigrammatic writer, but M. Klaczko perhaps somewhat overdoes his sarcasms on this subject. Some of the readers of *The Two Chancellors* may be tempted to compare it with his *Studies of Contemporary Diplomacy*—a comparison which will prove that a too inflexible and uncompromising consistency is not his foible. In the present

work he writes throughout not only as a loyal Austrian but also as a European Conservative. For a loyal Austrian, however, some of the points which he tries to score are rather indiscriminately chosen. Whatever may be the case now, Prince Gortchakoff's criticism—"Austria is not a State, it is only a Government"—was at the time it was uttered eminently just. So too, though M. Klaczko may choose to forget the fact, most of us will remember that the "Slavonic strangers" at the Congress of Moscow were not the only "subjects of Francis Joseph" who regarded "the disaster of Sadowa as a providential and fortunate event." As a European Conservative he reminds us continually of Macaulay's criticism of Burke's repugnance to the changes effected by the French Revolution. The book is full of sneers at the ideas of 1848, of criticism—often effective, sometimes merely supercilious—of all the politicians who have contributed, actively or passively, to their success, from Napoleon III. and Lord Russell down to Petropoulaki and "Philip the Bulgarian." It is in fact a good cry over spilt milk. But surely no one ever bewailed his own misfortunes and those of his friends in a tone of such amusing levity as does our lively Pole. Sober English readers will occasionally feel that his style is too lively, too ornamental, too allusive. But there is doubtless an admixture of sincere, and not undeserved, admiration in the polite sarcasm of Prince Giedroyc, "M. Klaczko est un écrivain qu'on lit et même qu'on relit avec plaisir."

ARTHUR J. PATTERSON.

A BYZANTINE EPIC.

Les Exploits de Digénis Akritas, épopée byzantine, publiée pour la première fois par C. Sathas et E. Legrand. (Paris: Maisonneuve, 1875.)

THIS book is an important addition to our knowledge of mediæval Greek literature. It is the nearest approach to an epic poem which the Byzantines have produced. The eastern frontier of Asia Minor, which is the scene of the principal events described, and the tenth century, to which the story belongs, are in themselves sufficiently favourable to a romantic tale; and the poem is pervaded throughout by a chivalrous tone, which suggests that the outlying parts of the empire must at times have fostered a spirit which was wanting at its centre. And it has an additional interest, as representing a peculiar phase in the history of the Greek language, and a stage in the development of the "political" verse in which it is written. The following is a brief outline of the story. A Saracenic Emir of Syria storms a fortress belonging to a member of the important Byzantine family of the Ducas, and massacres the occupants, with the exception of one daughter, whom he carries off with the intention of marrying her. Shortly after, her brothers, hearing of this, present themselves in arms before the Emir and demand her restitution, but are persuaded to allow him to marry her, when he has renounced Mohammedanism. It is then described at some length how he converts his mother, reciting to her the Nicene Creed, which is done into

verse for the occasion. After this long exordium, which occupies three out of the ten books that compose the poem, the hero himself, the offspring of this union, is introduced. Of his two names, the former, Digenes, is derived from the two antagonistic races which he represents; the latter, Akritas, from the services which he subsequently rendered to the empire as defender of the mountain-passes (*ἀκραι*) on the frontier. His Christian name was Basil. From his earliest youth he shows signs of extraordinary strength and prowess, and when he arrives at manhood he becomes enamoured of the heroine, Eudocia, a daughter of another member of the Ducas family, and wins her love and her hand. The remainder of the poem is taken up with his heroic actions in combating wild beasts and bands of outlaws, which he is made to narrate in person to his intimate friends, and with elaborate descriptions of the palace and gardens which he made for himself on the banks of the Euphrates. Of the last book, which contained the story of his death, only a fragment remains; but the loss of this is in part supplied by the modern ballads on the subject, which are familiar to the people, and have been often read by students of the ballad literature without any anticipation that they might learn so much more respecting their hero, Digenes. In them is related the fearful struggle or wrestling-bout which took place between him and Charon, or Death, ending in the triumph of the All-Subduer.

In the introduction, after an elaborate sketch of the Byzantine history of the preceding period, M. Legrand shows that Digenes Akritas was an historic personage, and identifies him with a general called Pantherios, who is known to have commanded the forces of the East in the tenth century. He has also collected with great industry the proofs that the memory of Digenes has been perpetuated in a variety of ways in the East; and this lasting fame he attributes partly to his personal valour, and partly to his having been the last representative of Greek influence in the neighbourhood of the Euphrates. The outlaws, who are called in the poem *Apelates*, are brigands of the usual type that infest the outlying districts of a weak kingdom, and the great work of his life consisted in subduing these. The names of the emperors Romanus Lecapenus and Nicephorus Phocas occur in the poem.

The editor is further of opinion that the poem itself is of the tenth century. The manuscript from which it is printed, which is the only one known to exist, and is kept at Trebizond, is of the sixteenth century: but for the earlier date of the composition he relies on two arguments, derived (1) from the character of the language employed; (2) from a statement in the poem itself. The Greek in which it is written is in a transition stage between the late classical language ordinarily employed by the Byzantines and the vulgar tongue which appears in poets of the twelfth century; and this stage, it is argued, must belong to a considerably earlier period. And the poet states, in so many words, that he received the details recounted in Books VI. and VII.

from the mouth of Digenes Akritas himself. It is likely enough that M. Legrand's conclusion is right, but we are not certain that his arguments are as safe as he considers them to be. For the mixture of classical and vulgar Greek, which is confessedly unique, might conceivably be the product of a later age; and it would be far from an unheard-of thing for a later writer, or even an interpolator, to enhance the reputation of the work by claiming for it a greater antiquity than it really possessed: to which it may be added, that the deeds which the hero is said to have narrated are as marvellous and as mythical as any part of the story.

Though the poem runs to a length of more than 3,000 lines, we can recommend it to our readers as easy and pleasant reading, free for the most part from the roughnesses and harsh transitions which abound in later poems, and very superior in treatment to other Greek romantic stories. The author was evidently a man of considerable cultivation, for here and there he has adapted Homeric lines, and some of the descriptions—such as that of springtime at the beginning of Book VII.—are highly picturesque and graceful. The manuscript is, unfortunately, in a somewhat imperfect state, though not so much so as to interfere with the continuity of the story. It has been excellently edited, and, in addition to very full discussions of the questions raised by the poem, it is accompanied by an accurate translation and a glossary. H. F. TOZER.

Shooting: its Appliances, Practice, and Purpose. By James Dalziel Dougall, F.S.A., F.Z.S., Author of "Scottish Field Sports." (London: Sampson Low & Co., 1875.)

"Guns and shooting," writes Mr. Dougall, "are popular subjects, very tempting to the *littérateur*." But inasmuch as he adds in the same page an epigrammatic shot at the literary brotherhood: "the practical mechanic or sportsman seldom writes—he only knows; the *littérateur* does not know, he only writes": it might be a fair retort were a reviewer to resist temptation by leaving his book unnoticed. Yet how then, amid such a diversity of opinions as to guns and shooting as every page of his book attributes to sportsmen and gunmakers, would the reading public be enabled to assess the claims of conflicting inventors and inventions without the arbitrement of those whose training in the field of letters, if not in those of turnips and stubble, has been tolerably careful and exact? Such stray shots ignore the need of "good words" which reviewers are not bound to return "for evil;" but as the volume of Mr. Dougall is really so practical and instructive that even a *littérateur* may gain out of it a crumb or two of knowledge of shooting, we shall make a virtue of our charity, and briefly direct the reader to its salient points.

The first and largest portion of the book concerns, with one exception, the appliances of the sport in question. "Dogs," it strikes us, should form a section in the second part, which concerns its "practice," and contains full particulars of the ground game and feathered fowl, which are the dogs' quarry. The third and last part discourses, with some

point and cleverness, on the purpose of "shooting," which is not "amusement," as that is shown by its derivation to be the antipodes of *action*, the very essence of field-sports. None will take exception to Mr. Dougall's claim for "shooting" that it is stimulating and recreative exercise, meet to balance the strain on mental powers; but there should be premised a very judicious mixture, before the assumption that "the mingling of the labour of field-sports with maintained exertion of mental faculties would tend to transmission of genius." The bias would be more towards reproduction of Nimrods than of Washingtons and Wellingtons. But this is the most speculative and problematical portion of a work for the most part practical; and in much that its author claims for field-sports sensible outsiders will candidly concur. He is on less debateable ground, certainly, in the discussion of the "appliances" and practice of shooting, for he speaks with the double weight of a scientific and successful gun-maker and withal of a perfect sportsman. It is evident from his enjoyment of an anecdote anent a middle-aged gunsmith's astonishment when first he saw a hare shot, and his exclamation—"Guns ought to be good. Why, it was all over like a flash of lightning"—that he cannot recollect the time when he was not a fair shot. Hence, and because also he is of an enquiring, observant, and scientific turn of mind, he discourses with weight and authority on the length, metal, hammering, proof, filing of barrels, "the most essential part of a gun," and the best shape and construction of stocks and locks. Mr. Dougall is a thorough believer in the exercise by sportsmen of binocular vision, as contrasted with the old fashion of closing one eye, and so throwing away the real sense of distance in taking aim. "On this system the aim is taken instinctively without any looking along the barrel, but in all other cases where a deliberate aim is taken, the longer the barrel consistently with ease in handling, the truer the aim" (p. 34). For general game the author prefers the use of barrels of twenty-six to twenty-eight inches to all others, and he sets great store by a stock exactly suited to the shape of the shooter. In locks simplicity is commended, and there are two distinct methods in their position on the gun—the back-action, still applied to common muzzle-loaders and rifles, and applicable, according to taste, to breech-loaders of all qualities: and the fore-action, adapted also for breech-loaders, especially in the case of a "lighter gun." The *differentia* of the breech-loader concerns "the manner in which the gun is charged, and several contingencies arising therefrom." It meets the prime necessity towards procuring the highest results from the explosion of gunpowder that the projectile to be acted on fills the barrel's tube so accurately as to allow little or no escape of evolved gas at the sides. Most experiments in gunnery are dictated by the desire to *lessen windage* (p. 74). The breech-loader is charged at the rear of the barrel, so as to obviate, in loading, the passing of the charge down the tube, and to limit the size of wadding or projectile, not to the ability to ram it home

easily, but to the power of explosion to drive these forward without fear of recoil or bursting. Though breech-loaders seem at first to have been a French invention, we gather from Mr. Dougall that the improvements in *locking power*, which were the defects of French breech-loaders, are undeniably English, as he has the best means of knowing.

An example of the clearness of Mr. Dougall's explanations of the meaning and causes of certain phenomena of shooting and its appliances may be given as regards "recoil," or what is familiarly known as a gun's kicking. This, he tells us, arises from the expansive action of powder being universal, and therefore acting as much on the breach, and from it along the stock upon the shoulder, as it does on the charge of shot. Recoil is more felt in rook-shooting, or shooting at ducks overhead, because the shock is then in the direction of the ground, which cannot yield under the feet to lessen the force. Under the excitement of firing at game, too, recoil is much less felt than in firing at a mark. Proper boring, thorough cleaning, and a moderate charge, especially of shot, are the simplest correctives. Of the Express Rifle, "the highest development yet known in the art of gun-making," we must leave the author to speak for himself.

One who has, from a long knowledge of what is wanted, perfected the appliances of sporting in the workshop, is not likely to be an uncertain Mentor afield; and so we find Mr. Dougall perfectly at home in directing how to load, and how to carry a gun, so as to kill your game honestly and run no risk of killing yourself. The principle of charging a gun with much heavy shot and little powder he considers less honest sport than the converse, and likely to exterminate without bagging the game, and he enunciates the maxim,

"If you wish to kill game dead,
Ram your powder but not your lead."

One frequent gun accident arises from dogs being allowed to jump and fawn on sportsmen. There is much anecdote and sound observation in the chapter on pointers and setters, and the author makes us young again (in pp. 202-6) upon "Ferretting rabbits." In hare-shooting the aim should be at the tips of the ears, as sole mark; and pheasant-shooting is not to be counted too easy work by reason of the bird's size and heavy flight. A novice in shooting is apt to be deceived as to the position of the body of the bird, and fire too low, because, though it rises slowly, it continues to do so to a considerable height, beside spreading out its tail broadly. Woodcock-shooting is allowed to have a peculiar zest for keen, quick shots, its drawback being the irregularity of the bird's habits and appearances; but "grouse-ing" Mr. Dougall accounts the best sport, at the same time that it is very hard—the hardest—work. With them, as with partridges, it is a mistake to "fire into the brown of them; one should single out, and cover, one bird. A curious phenomenon in partridge-shooting—the stricken bird ascending perpendicularly to an extraordinary height in the air—which is by sportsmen called "towering," is discussed in page 264, and attributed to a shot through the heart, for the plausible reason that throat and bill

of the bird that has towered are always found full of blood. Perhaps the most valuable practical matter in this portion of Mr. Dougall's book is his tracing of the grouse disease to overstocking, and it is no slight confirmation of this theory that the disease was never heard of before artificial increase was resorted to. Of the rest of the volume the two-eye system of shooting is the great and central revolution. J. DAVIES.

The Mechanism of Man. A Popular Introduction to Mental Physiology and Psychology. By E. W. Cox. (London: Longmans & Co., 1876.)

The Mechanism of Man is a robust volume of 500 closely-printed pages, and it is only the first volume of two. Its author, Mr. Serjeant Cox, "states briefly how so presumptuous an enterprise came to be adventured." Some time ago Mr. Cox felt "a rude disturbance of the confidence with which he had hitherto accepted the faith that he had a soul," and an immortal one. He therefore began a course of study and reflection, the results of which he presented to the public in a work called *What am I?* This book had a fair sale, but was only noticed by the *Morning Post*, and even the *Spectator*, says Mr. Cox, "put it aside without a word."* Mr. Cox, not discouraged, proposes to prove that "Man is not an automaton; that he is something more than body; that, in truth, we are Souls."

This position Mr. Cox intends to establish from the evidence of facts; "not until facts are accumulated should we venture to assign causes." But the very term "psychology" implies the hypothesis of a cause, namely, the soul, the existence of which Mr. Cox means to demonstrate; and so it might be argued that he violates the "golden rule of all true science, to collect your facts, and then, and not till then, to construct your theory." The value of this rule is open to question, and the practice of Mr. Cox does not appear to us to conform to it. "This treatise," says the author, "will be mainly devoted to *Psychology*, that is, the forces by which the mechanism of man is moved, directed, and controlled—LIFE, MIND, SOUL."

This statement confuses the forces with the science that investigates them, and is a fair specimen of Mr. Cox's style of printing. If italics were arguments, what a hand he would hold!

It is not easy to present Mr. Cox's argument fairly in a short space, and one is obliged to state some of his positions apart from his physiological introduction to them. First then, here are his definitions of Matter and Spirit:—

"Matter is all of creation that is of molecular structure, and therefore perceptible to our senses. Non-matter, or spirit, is all of creation that is not of molecular structure, and which therefore is imperceptible to our senses, constructed to perceive only molecular structure."

It does not, however, follow that "all non-matter is alike," and Mr. Cox is ready to allow that "it may well be that matter and non-matter are identical," whence it is open

* See, however, the ACADEMY, October 3, 1874, page 373.

to conclude that spirit and matter are the same thing, and indeed that when the atoms of spirit are compressed into molecules, spirit becomes matter, whereas the reverse process turns matter into spirit. Being and Nothing are identical, as everyone has heard tell, and there is something Hegelian in these earlier steps of Mr. Cox's argument.

To pass over a great deal about ganglions and the brain, the formation of which induces Mr. Cox to suppose that we have each of us two minds, he warns us not hastily to conclude that we have therefore two souls apiece. Far from that,

"Mind is the aggregate action of all the intellectual and emotional powers of the brain, that brain being only the organ through which the individual being, the Conscious Self, which is a Soul clothed in a molecular garment, maintains its connexion with the molecularly constructed world in which it dwells, receiving its impressions of that external world through the material mechanism of the brain. . . . This intermediate action of the mechanism is what we call *Mind*. The power by which the Soul sets the material mechanism of Mind in action is what we call the *Will*, and the force that makes the motion is the *Psychic* (or *Soul*) force."

How do we know this about the Will? From the evidence of Consciousness. Again, Psychology discovers the presence of the Soul in Man

"by witnessing its operations upon the expressions of the Mind and the actions of the body, and thence it concludes the existence [*sic*] of that non-corporeal entity, and learns something of its nature and character."

For still further confirmation, we learn that the Psychological Society of Great Britain, 11 Chandos Street, is founded to promote the investigation of psychological facts and phenomena. What are the facts and phenomena wanted? They are—

1. Remarkable cases of heredity in Man, Animals, or Plants.

2. Psychological phenomena that may have given rise to the belief in the existence of "the Double," as exemplified especially in the Second Sight of Scotland, and the Doppel-gänger of Germany.

3. Facts and phenomena illustrative of the power of supersensuous perception alleged to be exhibited in somnambulism and other abnormal conditions.

Mr. Cox's second volume is to be devoted to these facts, and oh, when he leaves molecules and comes to ghost stories, how much more interesting will his speculations be! He will learn, too, that "the Scottish Second Sight" was a form of clairvoyance quite distinct from the belief in a "Double."

We have copied Mr. Cox's definitions of Matter, Spirit, Mind, and Will; here is his description of Soul:—

"We must hold that it is not, and cannot be, immaterial, although non-molecular; but only that it is composed of very refined matter—so refined that it is imperceptible to our bodily senses, which are adapted only to perceive that form of matter which is made of molecules."

The next question, observes Mr. Cox, "would properly be as to the Shape of the Soul." But first where is the Soul? "It does not reside in any particular part of the structure, but it possesses the whole body." Then, as to Shape, "its form may be otherwise when parted from the body, but so long as it inhabits the body . . . the shape of

the soul must be the shape of the body." But this "is of course conjecture merely." The slight evidence in favour of it is drawn from a work with the promising title of *The Site of the Soul*, by Mr. Gillingham, a surgical machinist. He has studied the sensations of persons who have lost limbs, or been born without a leg or arm, and he suggests that "the soul occupies the same space which the whole body occupied before a part of it was destroyed."

Next, how about the soul after death: and first, how would it come into a room? "The soul would, or at least it *could*, pass through a wall of granite by gliding among the interspaces between the atoms that compose the stone." *Solvitur ambulando*, that no doubt is the way in which ghosts walk. That is the theory, but has Mr. Cox collected any facts about the apparition of a soul which tend to show that it came through the atoms of the wall of a room?

It will perhaps appear that we have not treated Mr. Cox with all the gravity which the subject of his book deserves. The reason of this apparent levity will be readily divined by any one who will give himself the trouble to read Chapter v. of the *Mechanism of Man*. When Mr. Cox tries to draw an understood though not expressed parallel between the feats of "mediums" and the facts of magnetism, when he talks about "scientists" refusing to accept the evidence of fifty persons who might have seen a bar of steel rise in the air untouched, he makes a confusion about the value of evidence. A magnet will always draw a bar of steel. The spectators need not bind themselves to sit still in the dark, or in a half-light; they need not accept any conditions about not touching the bar and the magnet, conditions which make anything deserving to be called evidence impossible. So long as the facts that some people call "psychic" are only exhibited under conditions which make real evidence impossible, so long science has a right to ignore them. A man who is in pursuit of "the very truth" has a right to ask to be allowed to test an experiment in every convincing way, and so long as he is refused this liberty he does well to turn his back on "facts and phenomena" which are only phenomena while the lights are lowered, and only facts when they are not grasped too vigorously. Especially if he is aware that when the conditions have been broken and the facts grasped, they have turned out again and again to be vulgar impostures, he is justified in passing by on the other side of the way from the theories that are based on such phenomena. These phenomena are curious, interesting especially in their historical relations, and may be blamelessly studied by any man for his own purposes. But, in their present state of development they are, by their very conditions, outside the sphere of knowledge; contingent, not necessary, not to be demonstrated. Πάντες γὰρ ὑπολαμβάνομεν, ὃ ἐπιστάμεθα, μὴ ἐνδεχέσθαι ἄλλως ἔχειν, τὰ δ' ἐνδεχόμενα ἄλλως, ὅταν ἔξω τοῦ θεωρεῖν γένηται, λαμβάνει εἰ ἔστιν ἢ μὴ.

A. LANG.

Descriptio Terrae Sanctae. Von Titus Tobler. (Leipzig, 1874.)

THESE early travels in the Holy Land are not here edited for the first time, most of them having been published in Wright's *Travels of the Middle Ages*; but Herr Tobler has collected them into a convenient volume, and furnished them with copious explanatory notes, thus bringing them within the reach of all Palestine archaeologists.

The record of a pilgrimage is not, as a rule, an interesting thing, the frame of mind in which the pilgrim sets out being rather adverse to correct or critical observation. An adventurous traveller, on the other hand, like Marco Polo, although too prone to take all the stories he hears for granted, yet goes ostensibly as an observer, and the consequence is that he tells us something of men and manners, and contributes something to geography in every line. But that well-meaning though somewhat fatuous ecclesiastic, St. Willibald (whose pilgrimage begins the book), confines his account of a visit to an interesting locality to such remarks as "we next reached Cana where the water was turned into wine," and as a rule gives us no information by which we can even identify the spot so pointed out to him. The title *Descriptions of the Holy Land* is a misnomer, and the impressions which the worthy pilgrims of the Middle Ages appear to have received are about on a par with those of a modern Russian peasant, who, after a long journey through Egypt, the desert of Sinai and Palestine, has nothing better to recount to his fellow-villagers than that he kissed a picture of ἡ ἁγία Θεοτόκος painted by St. Luke, and saw the stone on which the cock crowed when Peter denied his Master. Add to this the dog-Latin or bald *Langue d'oïl* in which the *Descriptions* are written, and we can hardly call the work an edifying one. No doubt we obtain a certain amount of knowledge of the sites to which old monkish tradition attached, but as these traditions were almost invariably wrong, they are of little interest in view of the modern system of scientific research by which identifications are arrived at. There are certainly a few crumbs of information among all this mediaeval rubbish, and these are fully descanted upon in Herr Tobler's notes, which are by far the most valuable part of the volume.

After a careful perusal of the itinerary of St. Willibald, I cannot say that I have learnt much except that the bishop saw a "lion" on the plain of Esdraelon, "qui aperto ore rugiens rancusque, eos rapere ac devorare cupiens, valde minabatur illis," and that he was guilty of a gross breach of the Custom House regulations at Jerusalem. When, however, we leave the rather promiscuous wanderings and vague descriptions of St. Willibald and the anonymous pilgrims, and come to the account of "La citez de Jherusalem," we are on more interesting ground, and the diligent antiquary may extract therefrom some data as to the changes which the external aspect of the city has undergone during the last few centuries.

The old *Tabula Geographica Marini Sanuti*, published with the volume, enables

us to follow the pilgrims on their various journeys.

The book is very carefully edited, but I must confess to a grave doubt as to whether the cause of Palestine topography would not be much the gainer if all monks and monkish traditions were banished from the land, and we were to trust more to the local legends of the peasantry and the unerring and impartial evidence of the Ordnance and Palestine Exploration Fund Surveys.

E. H. PALMER.

NEW NOVELS.

Azalea. By Cecil Clayton. In Three Volumes. (London: Hurst & Blackett, 1876.)

Success, and How he Won it. From the German of E. Werner. By Christina Tyrrell. In Three Volumes. (London: R. Bentley & Son, 1876.)

Mistress Haslewoode: a Tale of the Reformation Oak. By F. H. Moore. In Two Volumes. (London: Remington & Co., 1876.)

Marjory's Faith. By Florence Harding. (London: Samuel Tinsley, 1876.)

Frank Amor. By Jajabee. In Three Volumes. (London: Samuel Tinsley, 1876.)

Azalea is a story which, without having anything new either in plot or characters, is distinctly easy and pleasant to read, in consequence of its thoroughly cultured and well-bred tone. The plot is as slight as can be, and only two of the personages, the flower-named heroine herself and her one lady friend, are more than lightly-pencilled outlines. These two, however, are careful and conscientious studies, and contrasted with no inconsiderable success: the heroine, the daughter of the love-match of an English artist of good family and mediocre powers with an Italian Jewess, being described as a girl of large brain, high standard of right, pure and unworldly, and endowed with rare beauty; and her widowed friend, Madge Elliott, as a fast and worldly, but neither vulgar nor unfeminine, London woman of society. The men are all more conventional types, but each is sketched in with a firm and appreciative touch, and there are no blurred outlines. Further, the English style is much above the ordinary fiction level, and the only solecism we have noted is "frightened of," which recurs twice or thrice. The two scholarly old men of the book, squire and parson, might have been made a good deal more of, but what there is has been well done: and the Rev. John Purvis might stand for the first draught of Mr. Blackmore's John Rosedew in *Craddock Nowell*. A little more strength and colour, added to the grace, good taste, and refinement of *Azalea*, would lift the writer into a more than respectable place in authorship.

It was probably a dread of colloquialism that induced Miss Tyrrell to paraphrase the title of Werner's novel, which would have been much more exactly Englished *Here's Luck!* the precise equivalent of *Glück auf!* But she has been faithful enough in the rest of her version. Hitherto only two groups

of authors—French and English—have succeeded in the modern novel. There are a few single stories of high excellence in other literatures, such as Manzoni's *I Promessi Sposi*, and Hans Andersen's *Typprovisatore*, which for design and finish are rightly adjudged a place in the foremost rank of fiction. But, as a rule, admitting only the rarest exceptions, there is a crude immaturity and provincialism in even the cleverest novelists outside the two groups already named. Frederika Bremer and Emilie Carlén, Fernan Caballero, and a far more distinguished writer than any of these three, Tourguenev himself, are open to this criticism; while the German school, as represented by Auerbach, Nathusius, Hauff, Paul Heyse, and Freytag, despite occasional truth and power, is too often deficient in style, movement, and interest, and certainly at its best does not usually rank above the unconsidered average novels of one London publishing season. But *Glück auf!* is made of better stuff, and is handled with considerable power. There are two strands in the tale, carefully intertwined—how a marriage of barter becomes one of affection, and how an embittered strife between capital and labour is converted into a stable peace. Each of these is made to bear upon the other, and the hero of the book, Arthur Berkow, plays the chief part in both. He is well contrasted with a yet more vigorously drawn character, Ulric Hartmann, the ambitious and fiery leader of revolt among the workmen, whose strong individuality is depicted with unusual skill, and is altogether above the ordinary level of German works. Though the local colour is all correct, yet the book is so far from provincial in tone that it might have been a French or an English story without losing any of its vigour, save that a part of it, which turns on the lax facility with which divorce is granted and condoned in the German Empire, would have to be modified for countries where the marriage-law rests on a less precarious and immoral basis.

Mr. Moore's story is that of Ket's rising in Norfolk, in 1549, the nearest parallel in English history to the Jacquerie revolt in France two centuries earlier, to which it bore more resemblance than do the risings of Tyler and Cade in the reigns of Richard II. and Henry VI. The subject is a good one, but the author has fallen into the error of Strutt in *Queenhoo Hall*, and has subordinated narrative to archaeology, writing as he does altogether too much in the gramercy, quotha, and i'fackins style; and that not merely in the dialogue, but in the connecting matter. Even if a critic of language were inclined to accept the colloquial diction of the book as the real speech of Norfolk in the sixteenth century, exception must be taken to the pedantry of using words familiar only to professed antiquaries, when the meaning would be plainer, and the local colour unimpaired, by employing more usual phrases. "Ravelled" bread, for instance, when brown bread is meant, and "chete" bread, for household wheaten bread, are needless affectations, and there are many such. A few of the scenes, however, are sketched in with some vigour, but the best of them necessarily provoke comparison with the master-hand of Scott, and Mr. Moore cannot abide such

a test. Thus his May-gambol scene is far inferior to the well-known episode in the *Abbot*, and Ket's feasting in Thorpe Hall will not satisfy those who recall William de la Marck's banquet in Louis of Bourbon's palace at Liège, in *Quentin Durward*. There are some slips, too, in the easiest part of the work, that of historical statement. The reader does not gather, for example, from Mr. Moore's account, that Robert Ket, though a tanner by trade, also belonged by station to the ranks of the minor gentry, and was lord of no fewer than three manors. And much injustice is done to the fighting powers of his forces in the account of their final defeat. It is represented as the result of an undisciplined descent into Dussingdale Plain from the stronghold of Mousehold Hill (where the Reformation Oak stood), to relieve Norwich from Lord Warwick's troops, and to have ended in shameful rout, after one brief skirmish. As a fact, this fight had been preceded by several assaults of the insurgents on the city, into which they succeeded in forcing their way many times, and inflicting heavy loss on the King's army. The failure of provisions alone drew Ket down from Mousehold, and even when he was routed, the remnant of his Reformation Army fortified their camp, and made such a threatening show that Warwick was obliged to grant them liberal terms of surrender, which, for a marvel in that age, and by such a man, were faithfully observed. A story which professes to give an accurate picture of the struggle ought not to have slurred over some of its most striking features.

Marjory's Faith is seemingly a first attempt, and displays extreme inexperience throughout in its workmanship. Even the title is misleading, for there is nothing in the story involving any long trial of the heroine's constancy. Miss Harding's notions on a great many subjects appear to be of the vaguest, for the main situation of her book is that at its very beginning a young earl carries off the lady who seems to be intended as heroine, but who is found speechless and dying two years later at her sister's door, with a baby in her arms—the Marjory of the tale. Nothing is known of the facts till Earl Brangford turns up again eighteen years later, explaining how he had been duly married to Marjory's mother, but had kept the matter secret from the duke, his papa, who wrote to him every now and then urging another marriage upon him. Lady Brangford, coming on these letters, and finding her proposed rival's name in them, seemingly concludes that she has been deluded by a false marriage, or else, more probably, flies into a fit of jealous rage, goes off to her old home with her baby, nearly penniless, and dies of cold and exhaustion just as she gets there. Her husband, who never dreams of looking for her in the most obvious place, waits just four months, and then, taking for granted she must be dead, marries the lady provided by his father, thus saving himself from bigamy by a mere fluke; and discovers his daughter by sheer accident after his second wife's death. And, though the duke has been dead a dozen years at that time, his patent of nobility must have been limited in some

very curious fashion, for the son remains Earl Brangford still, obtaining no advance in rank. Miss Harding is also of opinion that his daughter, as eldest child, necessarily became heiress to all her father's personal property, to the exclusion of her two half-brothers, to whom the titles and entailed estates should descend. So much for the probabilities of the plot. The style is simply breathless, and, though the sentences are not always very long, produces the sensation of having no stops. It has the worse fault of fine writing of a moralising cast, varied by a few depressing passages intended to be witty and amusing; and, finally, the authoress—as she styles herself in her dedication—anxiously displays some little scraps of Greek and Latin she has picked up, the extent and value of which may be estimated by the order and orthography of one sentence, in which she speaks of "apodasis and prodasis" (*sic*). She must make an entirely fresh start if she is ever to do anything, for this book is so far from being on the path she desires to tread, that she must retrace every step of it before she reaches even the beginning of the road.

Frank Amor is a book of quite exceptional dulness, albeit the author seems to have had some notion of imitating the sensationalism of MM. Paul Féval and Xavier de Montépin. The greater part of the book professes to be autobiographical, but the hero is a hysterical lunatic who rages, cries, faints, and gets into inexplicable difficulties every three or four pages, and several of the other characters are no saner. There is not any discoverable plot, and the strain visible throughout deprives the author of the one palliation which might be offered, that he dashed off his book at full speed by way of trying how much the public could bear. There is a considerable display of recondite erudition made in various places; of which the most noteworthy specimen is, perhaps, a sentence which informs us that the Jewish Cohens "are of the united tribes of Judah and Benjamin, and claim to be the royal line of the Hebrews." It is just possible that Jajabee has heard of the Maccabee dynasty, and that this elaborate blunder is due to mixing his facts too recklessly.

RICHARD F. LITLEDAL.

SCHOOL BOOKS.

Dir Années d'Éril. Par M^{me}. la Baronne de Staël-Holstein: with Biographical Memoir, &c., by Gustave Masson, B.A. (Pitt Press.)

Le Vieux Cilibataire. A Comedy by Collin d'Harleville, with Biographical Memoir, &c., by Gustave Masson, B.A. (Pitt Press.)

Goethe's Hermann und Dorothea. With an Introduction and Notes by Wilhelm Wagner, Ph. D. (Pitt Press.)

Goethe's Boyhood. Being the first Three Books of his Autobiography. Arranged and Annotated by Wilhelm Wagner, Ph. D. (Pitt Press.)

Zaire. Edited by Prof. Théodore Karcher, LL.B., of the Royal Military Academy, Woolwich, &c. (Longmans.)

Alzire. Do.

Le Cid. Edited with English Notes. Do.

Polyeucte. Edited, with Vocabulary of Grammatical, Idiomatic, and Explanatory Notes, by Charles Cassal, LL.D. (Longmans.)

A Grammar of the Portuguese Language, with a Course of Exercises. By Alfred Elwes. (Crosby Lockwood and Co.)

THE four volumes of French and German authors lately issued by the Pitt Press are edited with care and judgment. The choice made by M. Masson of the second book of the *Memoirs* of M^{me}. de Staël appears specially felicitous. If there be a subject upon which instruction is needed by the class of readers for whom these books are prepared, it is the meanness of Napoleon I. This instruction has been partly given by Mr. Bowen's edition of the campaigns of Napoleon; and the book before us, not by its notes (for in respect of historical criticism M. Masson is colourless), but by its text, will give it still more. The passages selected from contemporary poets are interesting, both from a literary and from a political point of view. This is likely to be one of the most favoured of M. Masson's editions, and deservedly so.

Collin d'Harleville's amusing play, *Le vieux célibataire*, also by M. Masson, has English arguments prefixed to the acts, as in his less fortunate selection of Piron's *Métromanie*. M. Masson is doing good work in introducing learners to some of the less-known French play-writers. The arguments are admirably clear, and the notes are not too abundant.

Dr. Wagner's edition of *Hermann und Dorothea*, also for the Pitt Press, is introduced by a preface which he claims to be a digest of most of the literature that has gradually gathered round the great *bürgerliches Idyll*, and which treats in sufficient detail of the metre, prosody, and style. The notes are among the best that we know, with the reservation that they are often too abundant. Mere translations should never be given. As an example of a vicious kind of note, we take one from the page before us: *Gewaltsam*, we are told, means "violently" = *mit grosser Gewalt*. There are many such. The note immediately preceding it, on the other hand, is tasteful and necessary.

The same remarks regarding the notes will apply to Dr. Wagner's *Goethe's Boyhood*. There is no preface attached, and the subject, an admirable one, perhaps scarcely needed it.

We cannot congratulate the editors of the five volumes of the London Series of French Classics before us on their choice of subjects. These volumes are intended, presumably, for schools. The two plays from Voltaire are perhaps the least unsuitable for such readers. The vivid language and nervous style of Voltaire may seize and retain the attention which will flag continually over the stilted though majestic style and the artificial antitheses of Corneille. Corneille's *Cid*, captivating as it was to the *blâsés* Parisians, captivating as it still is to matured readers, is not suited for boys who may have had the good fortune to know the story fresh from the brusque romance of Spanish ballads. A drama dealing with the subject of Christian conversion is still less suitable. Of the notes we disapprove (except in the point of the references given to other lines in which the same difficulty occurs) as being calculated to save useful labour. All three editors sin grievously in this respect, M. Stiévenard perhaps the most grievously. There are no arguments to the acts, and the editors appear to have been careful to omit in the Introduction anything which could tend to make a boy understand the historical place occupied by the author.

Two volumes of *French Classics* edited by M. Masson for the Clarendon Press are of much higher rank. The sixth volume contains Reynard's *Joueur* and Brueys' *Le Grondeur*. We wish that M. Masson had included—and hope that he will, later on, produce—*L'Avocat Patelin*, and that he

will then follow his usual plan of prefixing well-written arguments. The seventh volume contains extracts illustrative of the reign of Louis XIV., from Cardinal de Retz, M^{lle}. de Montpensier, M^{me}. de Motteville, and St.-Simon. These two volumes should form a useful half-year's school course.

French Genders by Rhymer is the title of a silly little book. The feminine exceptions are worked painfully into a kind of rhyme, and the masculine ones are placed in a long and unsuggestive list.

Although we cannot accept M^{me}. Gayard's lively little book as in any sense a substitute for a good school French grammar, yet for students who have pretty well mastered the initial difficulties of the language it may be useful, inasmuch as it is clearly written with the view of helping them to appreciate partially the finer shades of difference, of which those who have not the opportunity of continual conversation with educated Frenchmen must remain in a great measure ignorant. There is, however, much that is unsatisfactory, and much that is unnecessary. Of the first kind we notice the chapter on genders, and of the second the list of "verbes avec ressemblance." No list will be of any use to pupils who are apt to confound *hériter* with *irriter*, or *perpétuer* with *perpétérer*.

The French Syntax by M. Darqué is a logical, well-written book. The chapter on the subjunctive, in which the ideas of doubt or of certainty are clearly shown as the motive powers, as it were, is specially commendable. The exceptional rules on the agreement of the past-participle are also satisfactorily done. But we protest against the somewhat supercilious way in which M. Darqué dismisses what all teachers of French grammar know to be one of the ideas most difficult to explain, by saying, as on p. 47, "The matter is too plain to require further elucidation." The second edition of the *French Grammar* accompanies the Syntax.

In his *Second French Exercise Book*, Mr. Breyman has collected some seventy exercises on the tenses, and on the different parts of speech, fairly comprehensive in their range, but lamentably incomplete in many of the sections. An attempt to do any good, for example, with conjunctions apart from the subjunctive is a barren one, and for even a working knowledge of the subjunctive not one exercise is needed, but fifty. The exercises on the tenses and genders are good, and the book will invite learners by its pleasant type and arrangement.

M. van Laun publishes two *English into French* books. His aim is almost a higher one than is usual in a "First" Book. It is to teach the learner how "to give back, not only the equivalents of the words, but the very spirit, idiom and accent of the original author." M. van Laun has selected the difficulties with the judgment of experience. The small chapters on the preposition and adverb are good, and might have been longer, and what we may call the moral reflections fewer. The second part is merely a selection of English passages with sensible footnotes.

The two volumes of *Anthology of Modern French Poetry*, compiled by MM. Cassal and Karcher from the choice pieces of the most pleasing of contemporary French poets, and published by the Clarendon Press, will be found useful as affording occasional relief from the more solid matter which usually and rightly occupies the work of a form. It is well that boys should learn that France has poets such as Hugo, Lamartine, Gautier, Musset, and Scribe, even though unable fully to appreciate their beauties. The books are well printed, and the device of putting in black type the words which are noted at the end is serviceable. The notes themselves are commendable as not being entirely translations or derivations given to no purpose but that of saving the learner trouble. They are on the same plan as those to the edition of the London Series of French Classics, but far better.

The *French Studies, Grammatical and Idiomatic*, of M. Eugène is as successfully planned as any of the numerous royal roads to French in our list. We limit this praise, however, to the *Accidence*. The *Syntax*, though fairly clear, is composed of rules without reasons; the exceptions to the ordinary rules of agreement of past participles of transitive verbs (with which the use of *faire* is mixed up without comment) are left baldly expressed, although they admit of obvious explanations, which give force to the rule and form admirable training; while, as usual, the subjunctive is very imperfectly discussed.

M. Roulier's unpleasantly-titled book is one of questionable utility. It would be wasted time for a young learner who had to master *accidence* and *syntax* to set to work to learn by heart that which he will, as his reading extends, in a great measure learn without learning. If, however, he desires practice, this book will afford it excellently.

The *Public School French Grammar*, edited by MM. Brette and Masson, is founded entirely upon M. Brachet's *Historical French Grammar*, of the first part of which a clear analysis is prefixed. The editors have doubtless sufficient reason for pinning their faith to M. Brachet's theory, although, if we are not mistaken, his conclusions as to the small part played by the ancient dialects of Gaul in the formation of the French language are by no means unchallenged by etymologists of the present day. Any doubt on this point does not, however, prevent us from expressing our pleasure at the appearance of a book which, while retaining much of the suggestiveness of M. Brachet's work, is put into a form more suitable for our schools. We would give emphatic approval to the chapters upon the formation of substantives, adjectives, and auxiliary verbs, in which the origin of each termination is clearly explained. Of the *Syntax* we scarcely think so well. The past participles are well done, but the pronouns are not so clearly given as in other grammars with which we are acquainted, and the conjunctions receive very inadequate attention.

We do not imagine that much favour will be shown to Mr. Longman's *German Dictionary* by those who have M. Cauvin's work within their reach. Whether a book which is not unlike a six-inch cube is to be termed a pocket-dictionary is questionable. It is comprehensive and idiomatic, and, we suppose, fairly cheap. It should be; for the print is microscopic, smaller than Flügel. It has one great fault of arrangement: the different idioms under one word are not always placed in alphabetical order. Both parts are in one volume.

It is pretty well understood that "the acquiring the vocabulary constitutes a chief difficulty in the study of any language." Whether this difficulty is likely to be removed in the case of German by such means as those provided by Mr. Hoare in his edition of Hauff's *Märchen* we cannot say. Our own opinion is that bitter war should be waged against any further attempts to teach a boy to work without a proper stock in trade. No boy possessed of grammar and dictionary ought to be saved the trouble of using either by being told that *schlug auf* means "opened," or that *wess* means "knows." Without the vocabularies this is a pleasant enough selection of tales. As it stands it is a most hurtful assault upon sound doctrine.

A book which requires "directions for use," quite medicinal in their exactness, is not likely to be a favourite in schools, where, as a rule, the successful teachers are those who are most personal in their methods. The *First German Book* of MM. Havet and Schrupf may be useful—although sometimes very confusing—if the instructions are rigidly adhered to: but otherwise it will offer every possible facility for "cribbing."

Lange's New German Method, published by the Clarendon Press, is in four parts. The first consists of specimens of German writing, which will soon, we hope, be rendered unnecessary by

advancing civilisation. The second and third parts are conversations, more sensible than is usually the case. The fourth bears the somewhat ambitious title of "The Essentials of German Grammar." These appear to be fewer than we had thought. The book is well printed.

Another Clarendon Press publication is the second edition of the two volumes of typical selections from great English Prose Writers. As might be expected, these volumes form quite the best "English Reader" of a high class. The first volume contains extracts from all the writers of eminence from Latimer to Berkeley; the second from the Revolution to the present time. We are delighted to find that the editors have in the second volume included a few passages from Landor. If literary taste or style is to be learnt at all from three or four extracts from many authors of every variety of style, the editors may fairly lay claim to having done a real service in preparing these volumes.

Mr. Fleming has advisedly refrained, in his *Analysis of "The Advancement of Learning,"* from yielding to the temptation to which analysts most often give way, that of superseding the text-book by original opinions. At the same time it is by no means a mere collection of dry bones. Mr. Fleming's own remarks are always pertinent, and his quotations interesting. The words peculiar to Bacon, or used in a sense now obsolete, are clearly explained, and the examination papers at the end are an analysis doubly distilled. The diagram illustrative of the classification of the sciences in their present state is a great addition to the book. Mr. Fleming has written to supply a need, and has supplied it well.

The Two Napoleons is a short and very fairly written account of a few of the well-known scenes in the lives of the two emperors. It is probably too favourable and pitying in its estimate, though it does not shirk saying some hard things. The most useful part will be the latter, from which a boy may really learn a little about the second Napoleon. At any rate, he will learn that the Napoleons were two. The alternative title of the book is misleading.

Mr. Philpotts publishes his edition of the *Tempest*. It is unnecessary to say more than that it fully sustains the reputation of the series of which it is a part.

Mr. Curtis has had considerable experience, and has profited by it. His little *English Grammar* is clearly written, and the plan of the exercises is a good one. Probably exercises worked on the same plan, but taken direct from whatever book is in the pupil's hand, would be more useful.

Hans Andersen's Tales, edited by Messrs. Bell, are always welcome, and are "well adapted for distinctively educational purposes." This particular edition is a readable one.

Mr. Hamblin Smith, in his *Rudiments of English Grammar*, neither calls "the" a distinguishing adjective, nor the present participle the imperfect participle. Thus far we are grateful. But our gratitude ceases when we find such phrases as "but-words" and "therefore-words," which latter phrase is illustrated by two passages in which no other "therefore-word" but "therefore" itself occurs. Latin and Greek derivatives and prefixes are of no use except to those who have learnt some Latin or Greek, and such would recognise them without a list. Oddly enough, while Latin and Greek abounds, there is no reference to German. Is Mr. Smith right in saying that in the line "I banish her my bed and company," "my bed and company" forms a "second objective case"? At any rate it is confusing to a learner to place it side by side with "We make ourselves fools."

Mr. Knight's *English Composition* is on an original plan, as to the possible success of which we will not venture an opinion. Moreover, it is intended for students "of either sex." We were not before aware that the rules of English composition in any way varied with sex. Any how, the

analytical exercises upon the well-chosen passages which close the book may be used with advantage, as Mr. Knight says, by both sexes alike.

The first paragraph in Mr. Croft's *Aids to Accuracy* is charmingly naïve. It runs thus:—"Ancient name, Albion; called Britain from Brutus, the first king, who landed *circa* 1108 B.C." How must the shade of Geoffrey of Monmouth rejoice at this unlooked-for revival of true learning. Of "Aids to Accuracy" there are none, unless the doggerel verse containing confusion worse confounded on the various railways is to be called so. Better learn Bradshaw.

Neither the style nor the print of Mr. Alfonso Gardiner's *Fifth Standard Book* is likely to invite the labours of children who go from school to homes where light and quiet are hard to come by. And we doubt whether notes such as that the saltiness of the Mediterranean Sea is due to evaporation are likely to encourage accurate habits. Mr. Gardiner probably tells these children that the earth is an oblate spheroid. He certainly tells them that the *o* in "cenotaph" in Shelley's well-known line is long.

A somewhat inflated introduction is prefixed to Mr. Bowen's *Studies in English*. This is merely a series of passages forming a very meagre selection from well-known English authors. Slight biographical notices are affixed to each piece.

Johnson's great *Satires* are well-edited by Mr. Fleming, who places at the bottom of the page the corresponding passages from their models, Juvenal's third and tenth *Satires*, with Dryden's translations. The notes are, we are pleased to find, few in number, and interesting.

The *Guide for Customs' Candidates* seems well adapted for its limited aim. It contains useful practical hints on all matters connected with examinations of this class, and a well-selected set of papers.

Goldsmith's Traveller forms part of Messrs. Stevens and Morris's series of annotated poems. The footnotes are clear, and, for the most part, necessary.

Mr. Cotterill's *Tasso*, published by the Clarendon Press, is another witness to the fact that Italian is beginning once more to strive for its old position in English school instruction. This attempt is on the whole judiciously executed. The Introductions and Arguments are good: so are the notes, especially those of a philological character; the rest are perhaps a little too helpful. Mr. Cotterill quotes Robello in most critical cases.

Mr. Elwes has published his *Portuguese Grammar* rather we suppose to complete the series than to supply a demand. It is simply and clearly arranged. OSMUND AIRY.

NOTES AND NEWS.

MR. EUGENE SCHUYLER's long-expected *Turkistan; Notes of a Journey in the Russian Provinces of Central Asia, and the Khanates of Bokhara and Khokand*, will be ready for publication by Messrs. Sampson Low and Co., on Thursday, the 14th instant.

MR. ARTHUR ARNOLD has promised to deliver a lecture to the members of the Birmingham and Midland Institute on "Persia" in the autumn.

MESSRS. HENRY S. KING AND Co. are about to publish a narrative of journeys made by Col. Playfair in the steps of the famous Abyssinian traveller, James Bruce. Peculiar interest attaches to this volume because, by the kindness of Lord and Lady Thurlow, the great-grand-daughter of James Bruce, a very large collection of his original drawings, which have never been made public, have been placed at the disposal of Col. Playfair. They comprise drawings of all the important Roman and Mauritanian remains, drawn for the most part in duplicate by Bruce, and by Balugani, the Italian artist who accompanied him on his tour. Time and spoilers have done much to destroy these remains in the last hundred

years, and the earlier beauty of many can only be understood by means of these drawings, which are of equal beauty and accuracy. A large number of these will be reproduced in the present volumes.

LADY CHARLOTTE SCHREIBER'S translation of the *Mabinogion* is about to be published in a cheap and popular form by Mr. Quaritch, of Piccadilly. Her original edition of the text and translation is both costly and rare, and thus inaccessible to thousands of readers who would gladly be acquainted with the ancient Cymric legends which are the chief source of the whole literature of Arthurian romance.

THE Early English Text Society gets a good help from Germany, as the Chaucer Society does from America. The editor of *Altenglische Legenden*, Dr. C. Horstmann, has undertaken to edit for the Early English Text Society all the Early English Legends or Lives of Saints:—1. Those not contained in the well-known collection in the Harleian MS. 2277, from which Mr. Furnivall edited fourteen for the Philological Society in 1862; 2. This collection, of which Dr. Horstmann has already copied eight thick quarto MSS. To this collection, of which the best MS. Harleian 2277, is in the Southern dialect, Dr. Morris will write the grammatical introduction, in continuation of his like essays on the Northern, East and West Midland, and Kentish dialects, in his different editions of certain of the Early English Text Society's books.

THE Life of Charles Kingsley which will appear during the present winter season will contain as a facsimile of his handwriting the manuscript of his well-known verses, "Three Fishers went Sailing out into the West."

THE Lectures on Genesis delivered by the late Rev. F. W. Robertson, of Brighton, will be published very shortly by Messrs. Henry S. King and Co.

MR. DEMETRIOS BIKELAS has just published at Athens, and with Messrs. Williams and Norgate, in a handsome octavo of over 600 pages, his translation of Shakspeare's *Romeo and Juliet*, *Othello*, and *Leir*—*Σακσπείρον Ρωμαιοὶ καὶ Ἰουλιέτα, Ὀθελλὸς, καὶ ὁ Βασιλεὺς Ἀἰρ*—with an introduction and notes, incorporating the results of the latest criticism in Germany, France, and England.

MR. DAVID SYME, the proprietor of the *Melbourne Age*, who is staying for a short time in this country, has written a work entitled *Outlines of Industrial Science*, which will be published this autumn by Messrs. Henry S. King and Co. Its object is to expose what seem to him the fallacies of the modern English school of political economy, and to construct a system of doctrine in place of that now existing, to the method, matter and form of which the author is entirely opposed.

THE Chaucer Society has just received the welcome news that Prof. Hiram Corson, of the Cornell University, Ithaca, U.S.A., has volunteered both to make the Index of Names and Subjects to the Society's edition of *The Canterbury Tales*, and also to edit its *Concordance to Chaucer's Works*, of which the material is being prepared by divers members and helpers.

A CORRESPONDENT writes: "Allow me to add to Prof. Mahaffy's list of Dr. Henry's books two more—*Menippea*, without his name, 8vo (Dresden, 1866); and the first volume of '*Aeneidea*, or critical, exegetical, and aesthetic remarks on the *Aeneis*,' with a personal collation of all the first-class MSS., and upwards of a hundred second-class MSS., and all the principal editions,' royal 8vo, printed at Leipzig in 1873, but never yet published."

A RETURN of considerable import to those interested in university education has been recently printed by order of the House of Commons. It states the number, names, and description of professors, their emoluments, number of lectures

delivered by each, number of auditors, &c., &c. Accompanying the statement are letters from the different professors, going more or less into particulars. Dr. Pusey thinks that, from various causes, few are qualified to gain much from critical lectures on Hebrew. Since 1870 his own pupils have been very few, never exceeding ten, and sometimes lower; one term his deputy had but three. The Professors of Pastoral Theology and Ecclesiastical History get an average audience of fifty each. Dr. Jowett lectures on Thucydides to an average of forty students; the Professor of Latin to some twenty; the Camden Professor of Ancient History to six; and the Professor of Modern History to about twenty. At the three lectures delivered annually on Poetry, some fifty or sixty persons attend, but "of these many are women." Mr. Ruskin writes that he is obliged by the terms of his Fine Art Professorship to give twelve lectures in the year, and that he never intends to give more; his average attendance is above 100. In 1869, the first year of his appointment, the present Professor of Arabic delivered forty lectures to one student, and in the following year to two; since then he has abandoned the hope of forming a class, and consequently no lectures have been delivered since 1870. At Cambridge the number at Divinity lectures is tolerably large, as students going in for the Theological Examination are required to attend a certain proportion of those delivered. The Professors of Physic, Anatomy, and Medicine get an average of eight, forty-three, and twelve respectively. The Sadlerian Professor of Pure Mathematics attracts an average audience of two; Mr. Seeley lectures on Modern History to from forty to sixty hearers; Mr. Fawcett on Political Economy to about forty; Mr. Liveing on Chemistry to fifty or sixty; Dr. Macfarren on Music to about sixty; and Mr. Colvin on Fine Art to about sixty. This last figure, however, includes ladies and members of the Senate; the usual number of undergraduates attracted by the subject or the lecturer is put down at "from one to ten."

MR. JOHN RHYS has embodied some interesting remarks on local pronunciation in his recent official report on the schools inspected by him in the counties of Flint and Denbigh. It seems that the Welsh children pronounce words like *baby* and *all* as though they were *bibby* and *ole*, while their inability to pronounce the sounds *sh*, *ch*, and *j* leads them to read a sentence like "Charles and James got a shilling each for finishing the job which they had begun," "Tsyarles and Dsyames got a silling eats for finicing the dsyob whits they had begun." In some parts also the Carnarvonshire habit of giving a sputtering pronunciation to a final dental is not unusual, while the *u* of North Wales, which resembles the German *ü*, is frequently substituted for the English *i*. Greek scholars will be especially interested in learning that the semi-vowels *w* and *y* are liable to be discarded at the beginning of words: thus *wood* and *woman* become *ood*, *ooman*, and *ye* or *you* become *ee*, *ew*.

THE proposed Chair of Comparative Philology at Cape Town still occupies the attention of the colonists, and the great importance of having Dr. Bleek's labours continued and completed by a trained scholar, and the languages and folk-lore of the South African races examined and preserved before they perish, makes the subject one of intense interest to all European philologists. Mr. Molteno, the Premier of the Colony, and his secretary, Mr. Trimmen, are at present in England, and it is well known that they are personally favourably disposed towards the project. It now turns out that the difficulty that has arisen as to the endowment of the chair is in great measure due to the action of the committee of the Public Library. The *Cape Standard and Mail* of July 11, states that "in 1862 a sum of 600*l.* had been granted by Parliament for the safe custody of the Grey collection, and for general purposes. 260*l.* of that sum had

been destined at the time by the committee for the salary of Dr. Bleek as Curator of the Grey collection; Mr. Maskew, the librarian, drawing the same amount. . . . Mr. Maskew's salary was afterwards increased to 300*l.* But it would appear that immediately after Dr. Bleek's death arrangements were entered into to abolish the custodianship altogether. Miss Lloyd, who had assisted Dr. Bleek in his Bushman studies, was asked to copy the catalogue of the Grey Library for a period of twelve months at a salary of 125*l.* a year, on the understanding, however, on her part, that this would be a mere temporary arrangement until the appointment of Dr. Bleek's successor. 120*l.* were coolly added to the salary of Mr. Maskew, who may be very well qualified to look after the Public Library as it is now arranged, but who has never had the reputation of being a scientific man, such as would be required to initiate the better educated part of the Cape public into the proper use of the literary treasures of the Grey Library. In the report of the Committee for the Public Library this was stated in such a form that neither the public nor the subscribers would be likely to discover it unless feeling particularly interested in the matter. In other words, the interests of science and of the scientific education of the Cape public, to which Dr. Bleek had so powerfully contributed by his personal influence, were sacrificed to the convenience of the librarian, and, to a certain extent, of the committee, who were probably as little anxious to see discontented faces as, according to Lord Macaulay, King Charles II.; and to the public the question whether they, too, approved of such a sacrifice, was never clearly put. . . . Valuable MSS. and scarce editions are not to be looked after in the same way as the volumes of a circulating library; and it would not only be a loss, but a disgrace to the colony if the valuable gift made by Sir George Grey to the Cape Town Library were allowed to suffer from neglect."

MR. F. J. FARADAY, F.S.S., who has just been appointed Curator and Secretary of the Manchester Aquarium, is also secretary of the active Field Naturalists' Society of that town. An aquarium that does not descend to the level of a fashionable lounge might easily become a centre of investigation for every branch of zoological science. We hope to see the Manchester institution affording facilities for purely scientific research, stimulating the taste for natural history, and directing it into useful channels.

THOUGH William Harrison is known to us only by his *Description of Britaine*, and interesting *Description of England*, both prefixed to Holinshed's *Chronicle* (1577, 1587), yet he himself looked on those books as quite secondary to the great work of his life, his *Chronologie*, which Holinshed tells us he "had gathered and compiled with most exquisit diligence." The good parson feared that the cost of producing his big book would stop it ever "coming abroad." And so it has. It had disappeared, till in 1850 Mr. Cotton, of Thurles, wrote to *Notes and Queries* that he had found it in the Diocesan Library of Derry. Mr. Furnivall accordingly applied there for it; and, though at first the searches for it proved fruitless, its second, third, and fourth volumes were at last found; and, by the Bishop of Derry's kindness, are now in Mr. Furnivall's custody. These volumes prove to be a chronicle of the world's history from the creation to the year 1592; and the fourth of them contains some interesting entries and opinions of Harrison on his own time. Under 1573, for instance, he notes that,

"In these daies the taking in of the smoke of the Indian herb called *Tabaco* by an instrument formed like a little ladell, whereby it passeth from the mouth into the head and stomach, is gretly taken up and used in England against Rewmes and some other diseases engendred in the longes and inward partes." Some of the home-life entries will be printed in Mr. Furnivall's edition of Harrison's *Description of England*, 1577-1587, which is nearly ready for the New Shakspeare Society; but the whole of the Elizabethan chronicle, at least, should be reprinted, as it reports Continental affairs as well as English. Harrison was at Cambridge in 1551. He was born "in Cordwainer Street, otherwise

called Bow Lane," on April 18, 1534. He died Canon of Windsor on April 24, 1593.

In the *Revue des Deux Mondes* for August 15 M. A. Geffroy describes the first results (chiefly interesting to mediaeval and patristic students) of the new French School at Rome. M. Henri Gaidoz begins a series of studies on the nationalities of Hungary; the first deals with the Serbs of the Banat, who have suffered many things between the Turks of Stamboul and the Turks of Buda. M. Henry Blaze de Bury maintains the ordinary view of the relations of Louis XIII. and Richelieu against M. Marius Topin's spirited vindication of the king.

In the *Contemporary Review*, Charles Elam, M.D., besides the usual objections to automatism and evolution, avers that protoplasm can only be resolved into water, ammonia, and carbonic acid gas by the addition of oxygen in the proportion, speaking roughly, of 170 oxygen to 100 parts plasm. Mr. Spedding concludes his examination of Lord Macaulay's essay on Bacon: the most interesting thing in it is a little disquisition of how respectable men come to be made scapegoats when an abuse is to be abolished. Dr. A. Schwartz has some good *aperçus* on French preachers, though his point of view is arbitrary. Edward D. Neill maintains that Lord Baltimore founded Maryland as a Church of England colony, and that toleration only dated from 1649, when he wished to attract Puritan settlers and was negotiating with the Parliament to avoid confiscation. F. W. Rowsell's article on "Capital Punishment in England" points out that the ferocious legislation in defence of property was mainly the work of the Tudor and Hanoverian dynasties, and that crime always diminishes during war. The most interesting article in the number is by Dr. Rigg, on the "Churchmanship of John Wesley." He makes the following points: at no time did Wesley hold what would be called high sacramental doctrine; after his "conversion" he felt and stated that his churchmanship had lost its foundation; he regarded "Apostolical succession" as a fable (upon Macaulay's and Chillingworth's grounds); the Minutes of Conference from 1745 onward prove that he regarded all questions of discipline as questions of expediency simply; he may have intended his society to include members of different communions, as the Moravian society then did; he probably hoped that in its progress his own society would come to include enough benefited clergymen of the Church of England to provide its members with the sacraments and keep them in the main within the Church of England. In the last years of his life there was a conscious return to the past; even then his protests against his preachers administering the sacraments were rather on the ground that they had no authorisation from him than on the ground that they had no ordination from a bishop.

In the *Fortnightly Review* Mr. Morley concludes his study of Robespierre; it is to be regretted that he did not take space enough for a few facts and dates. We do not wish his commentary curtailed; but it supposes a familiarity with the mere narrative which few readers have. He holds that Danton's real rival was Billaud Varennes, while Robespierre's real opponents were the dogmatic Atheists. Robespierre did not conquer Danton; he sacrificed him to his policy of putting himself at the head of the strongest combination of the moment. The Law of Prairial, under which as much blood was shed in the last three months of the Terror as in all the rest, was not intended by Robespierre as an instrument of general execution, but as an instrument for reaching Barras and other highly-placed peculators whose delinquencies would have been hard to prove. Mr. Morley does not believe that Robespierre really desired a dictatorship, though his intrigues were directed to attaining a position for himself in which he would be able to apply

the system which he erroneously supposed himself to possess.

In *Blackwood* most readers will have turned to the narratives of Mrs. and Mr. Wordsworth, the survivors of the *Strathmore*, which have the interest inseparable from the subject. There is a severe but not ungenerous article on "Alfred de Musset," taking his side, as the nearest approach to a right side, in the question between him and George Sand.

In *Fraser* Mr. Wratishaw has an interesting paper on the story of the bloody Parliament of Willemow; and Captain Roger Upton has an instructive one on Arabian horses.

In *Cornhill* there is a very candid and interesting article on Turkish ways and Turkish women, by F. G. A., a lady who lived five years as governess to a pasha whose wife was a princess. Mr. Julian Hawthorne's poetry is weird and graceful, and free from the brutality which disfigured his former endeavours to reach abnormal and intense effects. The article on Leopardi contains many enjoyable translations.

In *Macmillan* T. Wemyss Reid begins a monograph on Charlotte Brontë which is important as embodying copious extracts with lines to the original of Caroline Helston. The writer calls attention to the influence of her father; and apparently intends to maintain that her life was less tragic than is represented in Mrs. Gaskell's beautiful biography, and her character more in accordance with commonplace propriety than has been generally understood. Sir Bartle Frere concludes six papers on the Khojas. W. H. Mason discusses Homer and Dr. Schliemann, and makes several points in favour of the Hissarlik site, though not inclined to believe that topography tells in favour of the truthfulness of the *Iliad*.

In the *Dublin University Magazine* there is a lively instalment of "Lays of the Saintly" dealing with St. Fillan and parodying Scott.

In *Temple Bar* "Morality on a Spanish Wharf" deals with the proverbs of Cadiz boatmen, and is worth reading. The author of "Bitter Fruit" begins a new story, "An Old Man's Darling," rather in the spirit of Mrs. Lynn Linton.

MOST of the copy for the *Gentleman's Magazine* this month was burnt in a fire at the publishers', and the editor assures us that the author of *Comin' through the Rye* re-wrote her contribution from memory in less time than most people would have copied it. The composition is creditably finished and pointed. Leigh Hunt's remaining letters were burnt, so instead we have a first instalment of Douglas Jerrold's.

A COMPLETE edition of the poetical works of Mackay will shortly be published by Messrs. Frederick Warne and Co.

THE whole of the first edition of Mr. George Howell's *Handy-Book of the Labour Laws* having been sold, a second edition is now in the press and will be ready for issue during the present month. This edition will contain, in addition to other new matter, a review of the judgments of Barons Bramwell and Huddleston with regard to "picketing."

UNDER the title of *Badische Biographien* (Heidelberg: Bassermann), Herr von Weech has issued the first two parts of a biographical dictionary of persons of note connected with the Grand Duchy of Baden. As the author of a *Geschichte der Badischen Verfassung*, and of other works relating to the history of that country, he has special qualifications for the task; and he has obtained the co-operation of such men as Bartsch, Eduard Devrient, Max Düncker, Treitschke and Woltmann. Even persons who, like Gervinus, without being natives of Baden passed a portion of their active life within the Grand Duchy, will be included in the work.

MR. GEORGE SMITH.

THE death of Mr. George Smith, in early middle life, deprives the English school of Assyriology of its head and chief. Having for some years carefully followed the researches of Sir Henry Rawlinson and others, in the field of Assyrian research, he commenced in 1867 the study of the inscriptions. His researches convinced him that the chief difficulty in the reconciliation of Biblical and Assyrian chronology lay in the arrangement of the annals of Tiglath-pileser II., and he commenced a careful examination of the monuments of this king deposited in the British Museum. His studies were productive of most important results, in revealing the names of Ahaz and Azariah, kings of Judah, and Pekah and Hoseah, kings of Israel, as contemporaries of this monarch. During his researches he discovered an inscription fixing the date of the payment of tribute by Jehu, king of Samaria, to Shalmaneser II. The results of these researches were given in a series of papers in the *Zeitschrift für Aegyptische Sprache*. In 1867 he discovered and published an inscription fixing the date of a total eclipse of the sun in the month Sivan, B.C. 763. In the same year he was appointed to assist Sir Henry Rawlinson in the preparation of the third volume of the *Cuneiform Inscriptions of Western Asia*. During this year he discovered an inscription recording the invasion of Babylon in B.C. 2280 by the Elamites, and also an inscription showing the observation of the Sabbath among the Assyrians.

In 1866 he had commenced the copying of inscriptions relating to the Assyrian King Assurbanipal, the Greek Sardanapalus, for the purpose of publishing his annals. This work he gave to the world in 1871. There is no work published on the Assyrian inscriptions which has done so much as this to place the decipherment of the texts on a firm and accurate footing. The careful preparation of the text, and the accurate translation, accompanied by every variant reading, has made the work one which no student should be without. Some idea of the labour expended in its production may be gained when it is mentioned that over three thousand lines of texts are transcribed, transliterated, and translated in its pages.

In the same year Mr. Smith published a valuable little work on the "Phonetic Value of the Characters of the Cuneiform Syllabary." This work will always form a most necessary hand-book to every student of this difficult portion of the study of Assyrian. He also published in the *Journal of the Society of Biblical Archaeology* a lengthy and most important paper on the "Early History of Babylonia," which was the result of several years' labour on the difficult Accadian brick legends.

Having in 1872 been engaged in an examination of the mythological portion of the Assyrian collection in the British Museum, he discovered an important series of tablets. These tablets were part of a cycle of early Chaldean legends consisting of twelve tablets relating to the adventures of a mythical king named Isdubar. The eleventh tablet of the series he found to contain the legend of the Flood as current in Babylonia. Having copied and translated this tablet, he delivered a lecture on it before the Society of Biblical Archaeology. This discovery was the means of reviving the interest in Assyrian research and study, which had become very low and was confined to a few patient workers only. The proprietors of the *Daily Telegraph* came forward, and offered to defray the expenses of an expedition to excavate on the site of Nineveh, and accordingly Mr. Smith left England in January, 1873, and reached Mosul in March. His excavations at Kouyunjik were most important in their results in enabling him to complete many imperfect texts already in the collections. During this mission to the East he paid a flying visit to the sites of Babylon and other early cities. In the autumn of that year he returned to England, bringing with him a large and important collection of objects.

These the proprietors of the *Daily Telegraph* presented to the Museum.

The *firman* granted by the Turkish Government being unexpired, Mr. Smith again left for Mosul to continue excavations for the trustees of the British Museum, and having completed the period of the *firman*, and being unable to get a renewal from the authorities, he returned to England. The account of these expeditions he published in his work on *Assyrian Discoveries*. He now continued his researches in the mythology of the Assyrians, and was enabled to collect and join a series of fragments relating to the legends of Chaldean cosmogony, as well as many others of importance. The remainder of the year 1875 was devoted to the copying and translation of these legends, which were published early this year in a work entitled *Chaldean Account of Genesis*.

In October, 1875, Mr. Smith left England for the purpose of visiting Constantinople to endeavour to obtain a *firman* for excavations. After very great difficulty he obtained one, and returned to England to prepare his outfit. He left England for the East in March last, and, after landing at Alexandretta, proceeded to Bagdad for the purpose of inspecting some antiquities. Owing to the unsettled state of the country, and to the prevalence of the plague, he was unable to excavate, and was on his way to England when he was taken ill, and died at Aleppo on August 19.

Though essentially a specialist, Mr. Smith published in the *Journal of the Society of Biblical Archaeology* an important paper on the Cypriote inscriptions, to which he was the first in England to gain any clue, and this has since formed a firm basis for the investigation of others. He published last year, in the series issued by the S. P. C. K., a small *History of Assyria*, which is at present the only concise History of that important empire. He has left the complete MS. of a companion work to the above in the *History of Babylonia*, which it is hoped will shortly be published.

His loss will be greatly regretted by many who had the advantage of his personal acquaintance and could appreciate his kindness of disposition. By all who had occasion to seek his aid in their researches his loss will be most deeply felt; for he was ever ready to afford aid, either by information, or by placing every material possible in the hands of an enquirer. As a student of the Assyrian his knowledge of the texts was unequalled; and, from constant examination of the objects of the collection, he was able to find authorities for his statements on the tablets with as much ease as if they were folios of a library. As a copyist of the difficult script of the tablets he was unsurpassed; his careful study of variant forms in the palaeography, and his patient search after duplicate copies, rendered his publication of texts most valuable and trustworthy.

W. SR. C. BOSCAWEN.

THE LAST OF THE PASTONS.

IN the course of his researches among the Venetian Archives, Mr. Rawdon Brown has met with some interesting details of the wife and son of Girolamo Alberti, of whose diplomatic correspondence during his residence for four years in this country we have already given some account (see *ACADEMY*, September 25, 1875). Alberti's wife was an Englishwoman, her maiden name Margaret Paston—a member, in fact, of the well-known and ill-fated Yarmouth family. In the summer of 1695 the Republic of Venice determined to send a special embassy to William III. in the persons of Lorenzo Soranzo and Girolamo Venier, and among the Contarini MSS. in St. Mark's Library is a letter from Lord Yarmouth's daughter, dated September 15, 1695, from Selva, a country place near Treviso, to her cousin Charles Bertie respecting accommodation for the Ambassadors in London. Bertie in reply recommends the house of the late closet-keeper Chiffinch in St. James's Park—famous for

the dissipations therein of Charles—which was to be had furnished for twenty pounds a week; or a new mansion lately occupied by Judge Jeffries, a far more pretentious establishment apparently, for the rent of it unfurnished was fixed at fifty pounds a week.

Twenty years after this we find Carlo Alberti, Margaret Paston's eldest son, acting as Secretary to the Venetian Proveditor-General, at Napoli di Romania, when it was taken by the Turks in the summer of 1715. The enemy rushed to the Government House to seize the Proveditor's papers. Alberti endeavoured to destroy his ciphered alphabet by throwing it into a chafing-dish, but the Turks entering the room before the parchment was consumed, he is said to have snatched the burning roll from the embers and to have swallowed it. Thus, we are told, did he preserve the secrets of the State, whose plan of operations in the Morea would otherwise have been discovered through the interception by the enemy of the ciphered despatches which passed to and fro between the Venetian commanders. Alberti, now a prisoner, was sold as a slave, and became the property of one Haggi Osmanaga, a great personage at Smyrna, who for him and another Christian asked 4,000 piastres. How Carlo Alberti was ransomed, or otherwise obtained his liberty, does not appear; but some seven years after—that is, on November 21, 1722—he was undoubtedly in Venice, and acting as one of the notaries in ordinary of the Ducal Chancery; for, on that day, when in his purple gown he was waiting to accompany the Doge to the annual ceremony at the church of the "Salute," he was arrested by order of the chiefs of the Ten. On December 29 the arrest was unanimously confirmed by the Council of Ten, and on January 13 the same tribunal condemned Alberti to death. His crime was the passing and dispensing money-orders for pensions, &c., in the name of the Republic without the sanction of the Signory; he had been guilty, indeed, of breach of trust and forgery. In his defence he alleged, among other things, that he had been subject for the last fourteen years to epileptic fits, which at times deprived him of his reason. He also alluded to the service he had done the State at Napoli di Romania. A petition to the Council of Ten was also presented by the Alberti family, in which the services of his father and grandfather are mentioned; it contains, too, a paragraph by his mother, which is thus translated:—

"Would that I, Margaret Paston, Countess of Yarmouth, had never been born; or after becoming a mother had at least not survived for my utter misery until this my ruinous old age, if it only remains for me to see my son in the hands of the executioner; and to hear from England my country which I have abandoned, and from my kinsfolk there, that I came to shed their blood—which is illustrious—under the axe of judgment on an ignominious scaffold in this Queen City of the world."

It was at first proposed to behead Carlo Alberti publicly between the columns of the "Piazzetta," but it was afterwards ordained that the execution should take place in the dungeons two hours after sunset. The morning after, the body was buried in the vault of the Canons of St. Mark in the portico of the church leading to the chapel of the "Madonna." Margaret Paston followed her son into the grave but a few months afterwards.

HANSEATIC HISTORY AND LOW-GERMAN DIALECT.

THE annual gathering of the Society for the History of the Hansa towns ("Hansische Geschichtsverein"), which I announced in the *ACADEMY* of May 27, took place according to the programme during Whitsun week at Köln in the old Hansa-room of the Town Hall. The English visitors who were expected did not attend. But a few learned men from Holland represented for the first time the international tendencies of this promising historical confederation. Though papers

and addresses are always read when the members from east and west meet annually in one or other of the cities of the old League, both maritime and inland, their chief object will always be to support the issue of certain publications from the vast stores of records illustrating the history of trade and commerce and the international policy of a great portion of Northern Europe during the latter part of the Middle Ages.

On the occasion of the last meeting I reported on the new *Codex Diplomaticus* for the general history of the Hansa. Since then another stout volume has appeared, under the title *Hanserecesse von 1431-1476*, bearbeitet von Goswin Frhr von der Ropp. Erster Band (Leipzig: Duncker and Humblot), the importance of which to students of general and of English history in particular I again beg to be allowed to introduce to the notice of your readers. By *Hanserecesse* is understood very much the same multifarious body of documents as occurs on the English Rolls of Parliament belonging to the fourteenth and fifteenth centuries—that is to say, the minutes and proceedings of the general or the provincial diets of the civic League, together with a very extended correspondence, petitions and resolutions, treaties, lists of deputies, bills of accounts &c., &c. The originals, as they were sent home to the various towns, have to be collected, collated, registered, and extracted from almost innumerable city archives, not only within the Low German regions of the old Empire, but far beyond them—from London and St. Petersburg, as well as from Stockholm and Copenhagen, from Antwerp and Bruges. Only thorough scholars in palaeography and languages, in history and law, can be employed on such researches, and the most skilful editing is required either to reproduce the entire transactions or even to calendar them. As the publication of the more ancient *Recesses* down to the year 1430 had been taken in hand years ago, according to the advice of the late Dr. Lappenberg, by the Historical Commission of Munich, which entrusted them to the skilful erudition of Dr. K. Koppmann of Hamburg, the Society for Hanseatic History ventured to prepare a second and later series, purposing to push on the work into more recent times, but adhering to the same strict scientific principles of editing, and, with the assistance of the same well-known Leipzig firm, to the same excellent shape and print as had gained approbation in the first series. Moreover, the young editor, Dr. Goswin, Baron von der Ropp, a Livonian by birth, but a pupil of the University of Göttingen, and now himself teaching history in that of Leipzig, shows himself quite competent for the work, and a fair rival to his friend Koppmann, though evidently a less tempting period has been allotted to him.

The most brilliant time of the celebrated federation was over, when it committed the fatal mistake of supporting from the very beginning the union of the three Scandinavian crowns. It is true that Margaret, the great Queen of Denmark, was succeeded by the weak and inconsiderate Eric the Pomeranian. But the cities derived hardly any advantages on their side, when, in 1426, they renewed the war against the three northern kingdoms. Many of them laboured under internal difficulties, their aristocratic municipalities being frequently upset and expelled by the guilds—the trade-unions of the day—or their civic independence being altogether endangered by the daring attack of some neighbouring prince. At the same time, dark clouds arose from eastern and western neighbours to the great detriment of the superiority hitherto enjoyed on the high road of the sea, and of the fundamental pillars of the League, its outlying settlements. Poland, which after the accession of the Lithuanian dynasty almost on a sudden became a European power, had defeated the German colonisers and governors of Prussia, the knights of the Teutonic order, so that their master was obliged to be neutral in the great Baltic struggle, although he could not prevent

Dantzic, his most powerful city, from continuing to adhere to the old confederates. On the other hand, Duke Philip of Burgundy annexed without much hindrance Flanders, Brabant, and the Dutch Netherlands, prescribing to the western cities a new anti-federal, dynastic policy. When Rostock, in 1430, concluded a separate armistice with Denmark, and Stralsund was ready to follow its example, Lübeck and its confederates could not avoid suing for peace also. Yet their alliance with the Counts of Holstein and Dukes of Sleswick stood for several years in the way. The present volume comprises in 613 numbers the transactions from January, 1431, down to September, 1436, when after many difficulties and vicissitudes peace was at length restored.

Here it may be sufficient to allude to some of the more momentous consequences of so many intestine and foreign conflicts. After about the year 1423 the towns of Holland and Zealand, hitherto members of the Hansa, began to break off from the League, their vessels trying to force the passage of the Sound as enemies on every occasion, and to carry an illicit trade into the dominion of their former allies with the help of certain smuggling seaports. No wonder that henceforth all successors of Eric, who ruled over Denmark, Norway and Sweden, followed his example in continuing a firm alliance with Holland, while Duke Philip and his son made war against the federation of German cities, without ever proclaiming it in due form. The intercourse with the Flemish cities alone made an exception, because the Hanseatic factory at Bruges was too firmly rooted, and the democratic spirit of these places too independent, to allow any sudden disruption. So it happened that, whereas neither French nor English, both still entangled in their hundred years' war, respected the flag of the Hansa; whereas Scotch pirates scoured the German Ocean, and Spaniards the Bay of Biscay, in search of the well-stored traders from Bremen and Hamburg, Lübeck and Dantzic, Flanders, in want of the raw wool of the British Isles and the Peninsula, succeeded once more, about 1433, in inducing the hostile powers to let it pass, and in persuading the Easterlings to retract their prohibition of the trade.

Much new light is thrown by this collection on the precarious state of the contemporary affairs of England. And this is particularly welcome, as all scholars are aware, from Rymer and the Rolls of Parliament, of the progressive meagreness and fragmentary state of the national records, the more the French contrived to shake off definitely the yoke of their oppressors, and the more the first symptoms of the Wars of the Roses initiated at home a most terrible era of distress and disgrace. No doubt the Government, during the minority of Henry VI., endeavoured most conscientiously to abstain from touching the ancient privileges which the Hansa merchants hitherto enjoyed in London and in other seaports of the realm. But Parliament, closely connected with a steadily-rising national commerce, declined more and more to protect foreigners from the payment of the common dues and from the new and heavy taxes which were required by the difficulty of the situation. Moreover, the monopolistic spirit of the Easterlings never would grant to Englishmen similar rights of corporation in their own region to those which they themselves had for centuries enjoyed in their Steelyard in London. Without the least scruple they subverted the factories which the English founded either at Bergen in Norway or at Dantzic in the territory of the Teutonic knights. Hence arose quarrels in the English courts of law and in the various diets of the League, as well as piratical expeditions and open warfare. A number of papers in this volume refer exclusively to a heavy fine which had been outstanding for a considerable time. Once in the days of King Henry IV. English mariners had thrown overboard a number of Germans they had captured on the high seas. The English Government was ready to pay an indemnity, but part of it had been

transferred beforehand upon the Master of the Knights, and there was no end of accounting and explaining for and against.

The cities of Livonia seem to have been quite distinct, and much more independent than those of Prussia during this period. They had the great advantage of the chief trade with Republican Novgorod during all the time when Lübeck and her neighbours were almost exclusively engaged in war with King Eric. On the other hand, there was an interminable change of peace and war with the Russian princes, who arbitrarily stopped or set free the intercourse with the most eastward colony of the Hanseatic confederation.

By far the greater number of the documents, reports, minutes, treaties and letters—not to speak of a few in Latin or English—are written in the Low-German dialect, which at the time was used as the vehicle of a common and official language from the Gulf of Finland to the mouths of the Rhine and the Scheldt. The papers in Flemish differ so very little, or hardly more than in orthography, that every mariner or merchant from Lübeck or Dantzic must have understood them as well as his own homely speech. It was, therefore, a necessary and inevitable consequence that, about two years ago, a society for Low-German philology took its origin in intimate connexion with the "Hansische Geschichtsverein." The first issue of its annual periodical, *Jahrbuch des Vereins für niederdeutsche Sprachforschung*, Jahrgang 1875 (Bremen), has just left the press. All sorts of linguistic and literary subjects are discussed in a number of separate articles. Some very curious Mediaeval glossaries, and specimens of historical and allegorical poetry in different local dialects, printed for the first time, are interpreted in more or less extensive commentaries by competent scholars in comparative philology. It is natural that in such dissertations many details should occur which illustrate the history of the English language. I would therefore particularly allude to an article on the English Dialect Society, since its younger German sister has been started for the very same objects, and chiefly for the purpose of collecting, by the combined labours of fellow-workers who are scattered over a considerable extent of country, all sorts of materials for the history, the grammar, the dictionary, and the curious divergences of a distinct group of dialects so nearly related to the various idioms developed more than a thousand years ago by the Saxons, the Angles, and the Scandinavians in Britain. The philologists of the German Lowlands are quite alive to the old kith and kin, and therefore heartily subscribe to the answer which was sent by the Manchester Literary Club to an invitation of the English Dialect Society:—"The committee have expressed an earnest wish to help forward the national work undertaken by the English Dialect Society by every means in their power; and in reference to their own Glossary they will be prepared to meet the views of the Society in any way that may be deemed mutually advantageous."

The new German Society has almost immediately begun its own publications with a document full of linguistic, historical, and geographical curiosity: *Das Seebuch*, Von Karl Koppmann; mit einer nautischen Einleitung von Arthur Breusing. Mit Glossar von Christoph Waltner (Bremen). This rare document is preserved at Hamburg in two copies, which appear to have been composed in separate portions between the fourteenth and fifteenth centuries. The language, though Low-German throughout, has a tinge of Flemish. Its earliest chapters point distinctly to the Hanseatic factory at Bruges, since three various courses traced along the coasts of France, the south-west of England and Ireland, always terminate between the Zwin and the Isle of Thanet. It is a practical handbook for mariners of the time, containing directions for sailing the seas from the Straits of Gibraltar all the way up to the Gulf of Finland, with special information

about tides and currents, rocks, and shallow water, soundings, and distances from port to port. Hundreds of geographical names in their quaint spelling, the more scientific purposes of navigation, and the peculiarities of language, to a certain extent the common property of all seafaring nations of Teutonic descent, had to be explained by the editors. I have no doubt that the results of their researches will be highly welcome to the scholars of England, where navigation in the fifteenth century was attended with the same difficulties, but carried on nevertheless with the same eagerness, as in the nineteenth.

R. PAULI.

PROCEEDINGS OF THE THIRD SESSION OF THE INTERNATIONAL CONGRESS OF ORIENTALISTS, ST. PETERSBURG.

St. Petersburg: September 2, 1876.

The International Congress was formally opened on Friday, September 1, by a meeting in the great hall of the Imperial University, which was decorated with the flags of different nations. Most of the nations of Europe and Asia were there represented. In accordance with the Russian custom evening dress was *de rigueur* for the European members of the Congress. The principal seats were occupied by Count Tolstoy (Minister of Public Instruction), Prince Lobonow de Rostow, M. de Giers, Count Suwarow, M. Veliaminow-Zernow, and others. The Emperor of Brazil was there, but took his seat among the ordinary members. Some representatives from Siberia were present. A Kirghiz, a Yakut, and a Mongol were pointed out to me. The proceedings commenced with the singing of an introductory hymn of the Russian Church by the choir of the Chapelle Royale. M. Gregoriew, the President of the Organisation Committee, then addressed the meeting in a few words, but he did not speak very distinctly; at least, at the distance at which I was seated, I lost a good deal of what he said. He said something in praise of Science, about its being an asylum amid the many troubles of which the world was now so full. In this hall, he said, nearly all the nations of the world were represented. It was a great fraternal society. He gave a hearty welcome to all the foreigners who were present. They were received with open arms. He spoke of the fatigues they had undergone in their long journeys to St. Petersburg, but it showed what love there was of Oriental studies; and they would be the more united in that love from meeting together from such distant parts. M. Schéfer returned thanks on behalf of the strangers for the sympathetic welcome which they had met with. He spoke of the honourable contests of Science, of the constant liberality of the sovereigns of Russia, of the benefits which had been received from the researches of Russian *savants*, and he especially thanked the members of the Organisation Committee for all they had done.

The Baron Osten-Sacken, one of the members of the Organisation Committee, then gave an account of the work of the committee. Their duties had been very difficult, their position exceptional, in consequence of the gentleman who was to have superintended their proceedings, and who had been elected at the London Congress to preside at the present Congress, Count Hilarion Worontsof-Dachkof, having been prevented from undertaking the office. His place had been subsequently taken by M. Gregoriew. In consequence of the assistance they had received from the Russian Government he hoped that, notwithstanding the shortness of the time at their disposal, the committee had succeeded in doing the work that lay before them in an efficient manner. He then referred to the historical-bibliographical memoirs of the different sections of Russian research connected with the East, which several Orientalists of Russia had kindly undertaken to furnish at the request of the committee, in addition to the matters to be discussed

at the Congress. He also referred to the several important questions which had been proposed by the committee for discussion at the Congress, and to the numerous objects of interest relating to Oriental Archaeology, Ethnography, &c., that would be exhibited.

After this address the meeting proceeded to the election of the President of the Congress, the office, as was stated, having become vacant by the retirement of Count H. Worontsof-Dachkof, and M. W. W. Gregoriew, Professor of Oriental History, and Dean of the Faculty of Oriental Languages of the Imperial University, was unanimously chosen to be the President of the third, or St. Petersburg, Congress. Next, the presidents and vice-presidents of the different sections were elected. Nine sections had been formed of the subjects for consideration by the Congress. A president and two vice-presidents were required for each section, the condition being that one of these must be a Russian. The presidents nominated were as follows:—1. East and West Siberia; President: M. Vassiliew (St. Petersburg). 2. Middle Asia within Russian boundaries, as well as the independent principalities of Western Turkestan; President: M. Schöfer, Ch. (Paris). 3. Caucasus, as well as the Crimea, and other parts of European Russia inhabited by Asiatic peoples; President: M. Gamazow (St. Petersburg). 4. Transcaucasia, including ancient Georgia and Armenia; President: M. Kéropé Patkanow, (St. Petersburg). 5. Eastern Turkestan, Tibet, Mongolia with Manchuria and the Corea, China and Japan; President: M. Léon de Rosny, (Paris). 6. India, Afghanistan, Persia, and the Indo-Chinese Archipelago; President: M. Kern, (Leyden). 7. Turkey, including Arabia and Egypt; President: Ahmed Vefyk Effendi, delegate of the Turkish Government. 8. Archaeology and Numismatics; President: M. J. Oppert, (Paris). 9. The Religious and Philosophical Systems of the East; President: Mr. Robert Douglas. Among the vice-presidents were appointed, belonging to our own country, Prof. W. Wright (Cambridge); Prof. Chénery (Oxford); Robert N. Cust, Esq., Honorary Librarian of the Royal Asiatic Society; E. B. Eastwick, Esq., late M.P. for Penryn; and Captain F. C. H. Clarke, Deputy Assistant Quarter-Master-General, Horse Guards. Much regret was felt at the absence of Sir Walter Elliot, K.C.S.I., who had been appointed delegate of the Indian Government, but who, it was understood, had been prevented by the state of his health from attending the Congress. M. Gregoriew, after thanking the members for the honour they had done him in electing him as their President, stated that the Middle Asia Section would hold its sitting to-morrow. He also announced that the excursion to Peterhof, which had been advertised to take place on Sunday, had been unavoidably postponed to Thursday. The proceedings concluded with the singing by the choir of the National Anthem of Russia.

The following provisional programme of the sittings of the Sections and of the excursions has been issued by the Organisation Committee. Sept. 2, Saturday, at 10 A.M. and 7.30 P.M., Sittings of the Sections; Sept. 3, Sunday, Excursion; Sept. 4, Monday, at 10 A.M. and 7.30 P.M., Sittings of the Sections; Sept. 5, Tuesday, at 10 A.M. and 7.30 P.M., Sittings of the Sections; Sept. 6, Wednesday, at 10 A.M., Sittings of the Sections; in the afternoon an excursion; Sept. 7, Thursday, Coronation Day: an excursion; Sept. 8, Friday, at 10 A.M. and 7.30 P.M., Sittings of the Sections; Sept. 9, Saturday, at 10 A.M., Sittings of the Sections; in the afternoon, an excursion; Sept. 10, Sunday, a day of rest; Sept. 11, Monday, Festival of St. Alexander: an excursion; Sept. 12, Tuesday, at 10 A.M., Sittings of the Sections; at 1 P.M., Meeting of the Council. Close of the proceedings.

CORRESPONDENCE.

JACOPO DE' BARBARJ.

Montigny-sur-Loing: Sept. 1, 1876.

The two numbers of the ACADEMY for August 12 and 19 have only reached me to day. I see thereby that one of my letters in which I gave a brief analysis of a recent work by M. Charles Ephrussi on a Venetian artist of the end of the fifteenth century, Jacopo de' Barbarj, has called forth two communications—the one, a note by Mr. Drury Fortnum, introducing an interesting letter by Dr. Lübke; the other, an essay in correction of supposed errors, more passionate in tone, by Mr. W. B. Scott, author of a Life of Albert Dürer in English.

Dr. Lübke's remarks, already published in the *Beilage zur Allgemeinen Zeitung* for May 30 last, have no direct connexion with M. Ephrussi's work. They do not contradict its conclusions. If we allude to them, it is only because they bring into prominence a fact that concerns all lovers of early Italian art: the bronze plate, *Orpheus and Eurydice*, belonging to M. Gustave Dreyfus, and etched in M. Ephrussi's book, is not the only work modelled and cast by Vischer after the compositions of Jacopo. There are others in existence. This point has already been established in a notice by M. Bergau which appeared in the *Nuremberg Correspondent* of October, 1875.

Mr. Scott's essay is conceived in a very different spirit. Indeed, he was in such haste to reply that he has not given himself time to read or to re-read the work quoted. This method of discussion is liable to obvious inconveniences. I am, for my own part, very grateful to Mr. Scott, but the author has a right to protest. I do not know whether he will do so. It would be dangerous for his opponent if he did, for Mr. Scott has written with a precipitation which renders his conclusions either inaccurate or open to suspicion, although they are arranged under four heads, like a sermon.

1. To imitate my excellent opponent—where is the proof of the assertion that Jacopo was from Nuremberg and not from Venice? What is the demonstration of the hypothesis that Barbarj was a surname given by the Italians, and accepted by Jacopo—and also by the Nicolaus previously mentioned by Emile Galichon—for the sole reason that he "came from North of the Alps"? On the contrary, these leading points in the biography of the master are already settled beyond dispute. Albert Dürer, in the sketch of his preface to the *Treatise of the Proportions of the Human Body*, a preface which is repeated in a different form at the end of the Third Book of the same treatise, wrote: "I have never found anyone who has written anything on the proportions of the human body, except a man named

Jacob, born at Venice, a graceful painter." Observe that this expression, "graceful painter" (*lieblicher Maler*), or "lovely," "pleasant," if you will, corresponds perfectly to what we know of the figures of Jacopo, who evidently set before him as his ideal to give suppleness to the style of Mantegna with its combination of rudeness and delicacy. Are we then to suppose that our opponent is completely ignorant of the existence of historical documents which exist in manuscript at Nuremberg, at Dresden and even in London? Mr. Scott does himself wrong. There is a whole literature on this subject in existence in Germany. Heller, Zahn, Campe, Thausing can scarcely have escaped him when he was working at Albert Dürer. How can he have lost all recollection of these sketches for a preface, and so maintain that "lieblicher Maler" is "a modern critical appreciation"?

2. To continue; I have not the text of my letter before my eyes at the present moment. It is possible that, in correcting the proofs, I allowed sixteen to pass instead of eleven years. In any case the book reads, at page 15, in the fragment quoted from Dürer's letter to Pirckheimer:—"What pleased me eleven years ago does not please me at all now." This would be wholly unimportant did not Mr. Scott seize the occasion to translate and quote in the most singularly inaccurate fashion the text of this famous paragraph. His translation is as follows:—"What pleased me eleven years ago does not give me the same pleasure now, I confess. Then I praised no one but Master Jacob: but now I let you know there are better painters here, though! Anthony Kolb swears there is no better in the world than Jacob." We ought to know whether Mr. Scott possesses a new text, for I do not believe that that hitherto known can bear any other sense than this (after the lines above quoted): "if I did not see it myself, I would not believe it from any one. I likewise give you notice that there are also far better painters than Master Jacob, who is no longer here." If Mr. Scott's text were the true one, we should have had to suppose that what had pleased Dürer eleven years before was the work of Mantegna. Thanks to the deductions of M. Ephrussi—deductions to which we are compelled to refer the reader, for fear of making this letter too lengthy—misunderstanding is no longer possible. Jacob resided at Nuremberg before 1495, but this sojourn does not imply that he was born there.

We perfectly agree as to 3., with the reservation that for the reasons above stated Dürer and Jacopo can by no means be said to be "both High-Germans."

4. Mr. Scott's arguments under this head will refute themselves when Mr. Scott has before his eyes the book which has given him so much concern. It was M. Galichon who thought that Jacopo followed Count Philip of Burgundy to the Netherlands in 1506, and M. Ephrussi had good reason for opposing this view by a careful comparison of dates. I am surprised that Mr. Scott should have described as a "re-issue" of Emile Galichon's work a work which is entirely new, and which combats, courteously but firmly, its chief conclusions. Galichon showed his sound taste by drawing attention in 1861 to an artist of real merit whose biography is almost unknown. Science has advanced since his day. He would have been the first to profit by it. It is natural that M. Ephrussi, who is young and passionately devoted to these researches, should have profited by it also, and should have arrived at more distinct conclusions. There is here no question of a re-issue. We do not find even that engraving of the *Woman with the Hat* which Galichon attributed to the burin of Jacopo, but which, as Mr. Reid, the learned Keeper of the Prints at the British Museum, assured its present possessor, Baron Edmund Rothschild, was engraved by a Nuremberg master.

Here I must stop. I have no right to venture

further upon ground which I have seldom trodden since I have more specially studied the modern school. Besides, I am in the country, far from my books of reference, and I should be afraid of falling into errors as palpable as those of my opponent. It is, finally, not without advantage that discussion should be raised concerning one of those masters, half-Italian half-German, who, in the last years of the fifteenth century, realised, not without originality, a temporary fusion of the two styles. Jacopo is *par excellence* the would-be Germanised Venetian (Jacopo Wölsh). He has studied largely the supple and delicate engravings of Martin Schongauer. But how greatly his plan of Venice differs in point of arrangement from the plans, and in the method of handling the graving-tool from the views, of towns in the *Chronica Mundi* of Michael Wohlgemuth!

PH. BURTY.

SCIENCE.

The Dawn of Life; being the History of the Oldest Known Fossil Remains, and their Relation to Geological Time and to the Development of the Animal Kingdom. By J. W. Dawson, LL.D., F.R.S., &c. (London: Hodder & Stoughton, 1875.)

ALTHOUGH so poetic a phrase as *The Dawn of Life* has been chosen as the title of this attractive little volume, it need hardly be said that Principal Dawson is far too cautious a geologist to assert with anything like confidence that we are yet able—or for the matter of that, ever shall be able—to trace the first appearance of life upon our planet. In the early days of geology, when its students had but little experience, and therefore a good deal of confidence, they were not unwilling to believe that they had scanned the first lines on the opening page of the earth's history; a belief which found expression in a host of terms that still linger in our geological nomenclature—such as “primitive rocks,” “primary formations,” “bottom zone,” “primordial fauna,” and the like. The rashness, not to say the pride, of assuming that we have penetrated to the very beginning of telluric existence has often been exposed, but perhaps by no one better than by Prof. Edward Forbes.

“Geologists and palaeontologists,” said he, “are too apt to fancy that they have been favoured with a sight of the world in its swaddling clothes. If we do not much mistake, the Titans were mature giants ere they beat out the oldest stratum on which the geological hammer has yet rung.”

Since this passage was penned our knowledge of the older rocks has been vastly extended, but the course of discovery has steadily confirmed the sagacious conjectures of the naturalist. Chiefly through the labours of the late Sir W. Logan, in conducting the Geological Survey of Canada, we have become acquainted with an enormous series of deposits older by far than any stratified rocks previously recorded. These ancient and altered rocks, which are typically developed in the Laurentide Hills to the north of the St. Lawrence Valley, and are hence fitly termed “Laurentian” rocks, form a series, at least 30,000 feet in thickness, divisible into an Upper and a Lower group, and consisting for the most part of gneiss and limestone, associated with vast deposits of iron-ore, and in the Upper series with thick beds of basic felspar. For many years these rocks had been searched in

vain for traces of any organic remains, and hence they were classed with those strata which were somewhat rashly termed “azoic.” Yet there were not wanting reasons, partly chemical and partly biological, for conjecturing that the formation of some of these deposits was connected more or less directly with organic agencies. At length the day came for verifying these conjectures. In 1858 some specimens obtained from the Lower Laurentian limestones were suspected by Sir W. Logan to owe to an organic origin the obscure structure which they presented; and Dr. Dawson, on examining them under the microscope, not only confirmed this suspicion, but pointed out their relations to the Foraminifera, and at the same time suggested the now well-known name of *Eozoon*, or the “Dawn-animal.” When specimens of this supposed fossil were submitted in 1865 to Dr. Carpenter and Prof. Rupert Jones, the highest authorities on the Foraminifera in this country, Dr. Dawson's conclusions were verified and strengthened, and henceforth *Eozoon* was ready to take its place as the oldest known fossil.

Although *Eozoon* may appear to be an insignificant object, the importance of its discovery in extending our knowledge of the range of life may be inferred from Sir W. Logan's remark that, in comparison with the age of this fossil, “the appearance of the so-called Primordial Fauna may be considered a comparatively modern event.” So interesting a fossil might fairly claim its own monograph, and, indeed, Dr. Carpenter has hinted that there is some chance of such a work being prepared and submitted to the Palaeontographical Society. In the meantime Dr. Dawson has published the present volume, which is mainly devoted to a popular description of *Eozoon*, but yet contains sufficient scientific matter for the purposes of most students, its value in this respect being raised by copious extracts from original papers bearing upon the subject. Dr. Dawson, with his usual skill, has set forth his matter in very attractive shape, so as to form a work that is really readable with pleasure; and it may be added that the printing, the plates, and the general get-up of the volume are all that can be desired.

After describing the Laurentian rocks, the author sketches the history of the discovery of *Eozoon*, explains its structure and mode of preservation, glances at what are believed to represent its contemporaries and successors, and then discusses, with candour and generosity, the objections which have been raised against the conclusion that it is actually the remains of an organism. In this country the task of defending *Eozoon* has fallen almost exclusively upon Dr. Carpenter, who has, of course, conducted the case with the ability of an experienced advocate.

Eozoon, as preserved in typical specimens, exhibits successive layers of calcite, in some cases partially converted into dolomite, which alternate with lamellae of serpentine, loganite, or some other mineral silicate. This silicate has taken the place of the sarcod-body which occupied the chambers of the original organism, while the carbonate represents the walls by which these chambers were enclosed. Dr. Carpenter has shown

that the “proper wall” is perforated by fine parallel tubuli, resembling those of the nummulites; while the intermediate or “supplementary skeleton” is penetrated by a ramifying system of canals, and by passages through which organic connexion was established between the several chambers. It is, of course, only in the best preserved specimens that these structures are well seen, and it may be supposed that many of the objections which have been urged against their organic origin have been founded on the study of only imperfect specimens. Thus we lately observed in Dr. Vogelsang's posthumous work entitled *Die Krystalliten* (Bonn, 1875), that the author, after referring to the forms assumed by the precipitate which he obtained on addition of ammonium chloride to a mixture of lime-water and gelatin, thus expresses himself:—

“Was ich selbst unter dem Namen *Eozoon Canadense* gesehen habe, zeigte nur viel unvollkommenere Formen als diese künstlichen Niederschläge.”

In judging of the organic structure of a form it is necessary not only to possess typical specimens, but to study them with an educated eye; since it is well known that those who have long devoted themselves to the study of a special group of organic forms can often detect points of structure which escape the notice of an untrained observer.

In parting company with *Eozoon* we may repeat a word of caution against the unphilosophical notion current in certain quarters that this fossil really represents the first animal which was launched into being upon our planet. Dr. Dawson admits that in suggesting the name *Eozoon* he had “no intention to affirm that there may not have been precursors of the dawn-animal.” The history of the discovery of such a body in rocks which so long seemed hopelessly barren of fossils should stimulate further search in these ancient deposits, in the hope that haply they may yield some other traces of Laurentian life, and thus reveal to us the contemporaries, if not the forerunners, of *Eozoon*.

F. W. RUDLER.

Vie de Saint Auban: a Poem in Norman-French, ascribed to Matthew Paris. Edited, with Concordance-Glossary and Notes, by Prof. Rob. Atkinson. (London: John Murray, 1876.)

No country is richer in “etymological” dictionaries than ours. It would seem, however, that the nature of the etymology in our latest home-made dictionaries is not of the best. In Ogilvie's *English Dictionary, Etymological, Pronouncing, and Explanatory* (1874), we find under *abide*: “Sax. *bidan*, *abidan*; O. E. *abie*, from O. Fr. *abbayer*, from *baer*, to gape, to look with open mouth.” The same in Chambers's *Etymological Dictionary*, edited by James Donald (1875): “A. S. *bidan*, to wait; O. E. *abie*, from O. Fr. *baer*, to gape.”

When genuine Teutonic words like *abide*, *abie*, are derived from Old French, what will be the fate of less certain words? Observe, moreover, that in both these dictionaries *abash* also is derived from the O. Fr. *baer*. There can be no doubt as to the source of

this confusion. It is Wedgwood's *Etymological Dictionary* (1859-67), a book full of the most fantastic notions about the origin of words. Though he does not actually derive *abide* from Old French, he certainly implies that *abide* and O. Fr. *baer* both sprang from the same source, namely "*ba*, the syllable imitating the sound made by the involuntary opening of the mouth under the influence of astonishment." Latham, who does not always indulge in etymology, did not follow Wedgwood under *abide*, but in other cases copied him freely, and not always to his advantage—*e. g.*, under *pittance*, which Wedgwood derives from *apidançant*, *apitançant*, *appétissant*, words which can only have come from Lat. *appetere*, and have therefore nothing to do with *pittance*.

Really a historical dictionary of the English language becomes necessary! A few years ago the Philological Society were collecting materials for such a work: but it has come to a standstill, and it would be unadvisable to resume it, as long as the Early English Text Society have not printed all the texts which must show what and how words and phrases were used.

Of equal importance to us with the Anglo-Saxon, Early English, and Anglo-Norman, are the Norman-French texts. A great many of the latter are already accessible, and have enabled Dr. Morris, in his admirable *Historical Outlines of English Accidence*, to fill eighteen pages with words of Norman-French origin in the English language before 1300 (it would be better to say, words that have come into English through Norman-French). This fact certainly speaks for the influence which this particular dialect exercised upon the English tongue. It was with the object of facilitating the study of it that Dr. Atkinson undertook the editing of the Norman-French poem mentioned above.

"The Norman invasion of England," he says in his preface, "has left indelible traces on our speech, which seem to deserve a much closer investigation than they have had. The influences exerted on the vocabulary, pronunciation, inflection, syntax and idiom have never yet been duly weighed, nor their action fairly considered. . . . In 1302 the French language was so much unknown that the pleadings in the law courts were directed to be conducted in English; but ten generations of vigorous life may be expected to have left profound traces of their existence. The history of our English language is altogether one-sided if it does not embrace the period of the Norman-French, which bridges over in some small degree the gulf between Saxon and English, and which has a higher claim to our consideration as having been the matrix of our early English literary work."

The MS. of the poem is preserved in the library of Trinity College, Dublin. It is, as the title indicates, a Life of St. Alban, the protomartyr of England, and also of St. Amphibalus. Tradition ascribes its composition, or rather translation from the Latin into Norman-French verse, to Matthew Paris, himself "a munke of St. Alban." Dr. Atkinson gives the history of the Latin original in full. Some deny that the handwriting of the poem is that of M. Paris. The editor, however, accepts M. Paris as the author, as there is no counter-evidence. M. Paris was appointed historiographer to St.

Albans in 1236; he died in 1259; the poem is supposed to have been written between 1236 and 1250—therefore, in a period when Norman-French had not yet materially declined.

The editor proposed to himself a threefold task:—(1) the production of a faithful, accurate text; (2) a philological and etymological explanation of some of the most difficult words and phrases; (3) the compilation of a comprehensive concordance-glossary. Even a cursory glance at the book will convince every one that Dr. Atkinson has performed his task with singular minuteness and care. The glossary is not a mere list of words. As the editor has brought together, for the purpose of comparison, every word every time it occurs under its proper grammatical category, the glossary practically serves, so far as this fragment goes, as a complete grammar of Norman-French, so easily and admirably arranged that any one might draw up the grammar for himself. In particular attention may be called to the entries under *de*, *ke* (= *que*), *aver*. Turning to *esperit* (Spirit, Holy Ghost) we see at a glance that in the nom. sing. the forms were *Seintz Esperitz*, *li Seinz Esperitz*, *Seint Esperitz*, *li esperitz*, and in the acc. sing. *Seint Esperit*, *mun esperit*, while the eight lines in which the forms occur are given to remove all doubt as to their correctness. As the editor has strictly confined himself to the illustration of the poem, no missing forms or cases are supplied. So under *estre* we find all forms of the ind. pres.: *sui*, *es*, *est*; *sumes*, *estes*, *sunt*; but not of the impft. (I.) of which only occur: sg. 1, *estoié*, 3, *estoit*; pl. 1, *estoiūm*, 3, *estoiēt*. Of the impft. (II.) we find only: sg. 3, *'ert*; pl. 3, *erent*. Of the ind. pret. we miss the sec. pers. sing., while all the persons of the plural are represented, and even two forms for the first: *fumes*, *fuimes*; 2, *fustes*; 3, *furent*. By this plan anyone is able to see at once what there is and at the same time what there is not, in the book. The editor has rightly deviated from his general plan by repeating in many instances only the essential part of the line in the glossary, and in many cases only a reference to the line where the word is found. The editor has also fully treated of the final sibilants *s* and *z*, either added or fixed, and has pointed out the rules which governed their use. In a second appendix all the vowel-combinations occurring in the poem and their origin are dealt with in the most comprehensive manner.

In the notes the peculiarities and difficulties in the text are explained by means of etymology, minute comparison and copious illustrations of similar usages in the Romance languages, and in early English writers, especially Chaucer and Spenser. Occasionally Dr. Atkinson is able to correct some wrong notions of Diez and other scholars. It will be observed, however, that the poem, though containing some new forms, has afforded the editor none which enabled him to settle definitely any of the burning questions in etymology. In some instances there is a real luxury of forms: eight (*em*, *hem*, *hom*, *um*, *hum*, *home*, *umme*, *humme*) to indicate *man* (*homme*); five (*quer*, *queur*, *quor*, *quors*) to indicate *heart* (*cœur*). But there is no difficulty as to the derivation of

such words. Just in cases where a slight variation in the spelling might have relieved us from much perplexity in the future, the poem is singularly regular. Hence with regard to *selon* (*sulun*, three times), *dommage* (*damage*, three times), *besogne* (*busoinne*, twice; *busoingne*, once), *émail* (*aesmal*) and other like words, there is still room for further search and discussion. Again, *jueu* (in line 1149) goes with O. Fr. *joël*, *juël* (whence our *jewel*), &c., to uphold their derivation from a supposed *gaudi-ellum*; but *jocale*, *jocalis* (from *jocari*) may still be considered to have given rise to some of the various French forms of this word. At all events it would seem unadvisable to ignore them altogether, seeing that both *gaudiale* and *gaudicillum*, whence *joël*, &c., are derived, have never yet been found; that *gaudia*, in the sense of *rosary* only, occurs much later than *jocale*; that "*jocale*, sive *gaudeolum*," is found in a charter of 1398; that *bis-jocare* is suggested by Ménage and Diez as the probable origin of *bijou*; and that, finally, in a matrimonial contract of 1467 *injoquare*, seu *injuclare*, means to present jewels, gems, and other things of the kind.

In the second line of the poem occurs the word *adubbée*, adorned. Dr. Atkinson derives it from the A. S. *dubban*, to strike (dubban to riddere, to dub a knight), and Littré, Diez, &c., had adopted this derivation before. Dr. Morris, however, in his *English Accidence*, p. 337, assigns to *dubban* a Norman-French origin. He quotes from the *Saxon Chronicle*, where it occurs under the year 1086. Now, as no further Norman-French word seems to occur in this Chronicle until 1135, according to Dr. Morris's own table, there could scarcely be any doubt that (his solitary Norman-Fr.) *dubban* is an A. S. word which passed over into Norman-French, Mediaeval Latin, &c. The original meaning is still preserved in the Walloon *dauber*, to give a blow, whence it came afterwards to mean to touch, arrange, repair, dress, adorn, &c.

The note to *paene* in line 337 must be rectified. Speaking of this word, which in classic Latin *paganus*, rustic, came to mean *civil* as opposed to military, Dr. Atkinson says rightly that it has a different history besides. He then quotes from Du Cange a passage from St. Augustine: "*Deorum falsorum mutorumque cultores quos usitato nomine paganos vocamus*;" and continues to say that "no mention of these *pagani* is apparently made before 365 A.D." This date is found in Du Cange, but it is a wrong one, and should be either 368 or 370. The passage from St. Augustine has no connexion with this date. The real question is: the first legal mention of the *pagani* was made in a prescript of the Emperors Valentinian, Valens (and Gratian) to Clandius, proconsul of Africa, which was afterwards incorporated in the *Codex Theodosianus* (lib. xvi. tit. ii. c. 18), and in which it is said:—

"Quam ultimo tempore divi Constantii sententiam fuisse claruerit, valeat, nec ea in assimulatione aliqua convalescant, quae tunc decreta vel facta sunt, cum *paganorum* animi contra sanctissimam legem quibusdam sunt depravationibus excitati. (Dat. xiii. Kal. Mart. Treviris, Valentiniano et Valente A.A. Coss.)"

Now, as regards the date 365 given in Du

Cange and other writers, Haenel in his edition of the *Codd. Gregorianus, Hermogenianus, Theodosianus*, says (col. 1491*) :—

“Quod fieri non potest; nam annis demum 367-370 Valentinianum Treviris constitisse eodemque tempore, neque vero anno 365, Claudium Proconsulem Africae fuisse Gothofredus demonstrat. Putat igitur aut consules anni 363 (AA II.) aut anni 370 (AA. III.) reponendos esse. Pagius, quem Beckius sequitur, mavult annum 368, in quem quinquennalia utriusque imperatoris incidunt. Reposui annum 368. Cum et hic et in inscr. consentiant codd. 4 et 11, error videtur in ipso C. Th. fuisse.”

The labour Dr. Atkinson has bestowed upon this poem of 1845 lines is stupendous, as the most casual reference to the glossary will show. The grammatical arrangement alone required every line to be written as many times as there are words in each of them. Not a word, not a syllable, not a letter that required explanation seems to have escaped his attention. The book deserves to become known by study, not by the mere reading of our review. In a work where so many points had to be dealt with, oversights were hardly avoidable, and a reviewer is almost in duty bound to point out some, but those we have found are too trifling to mention. We commend the book to the attention of the workers of our Early English Text Society. Ten works edited after this manner would advance enormously the study of Early English. That the Society-men are willing to work is abundantly shown by the indomitable energy of Mr. Furnivall in promoting all kinds of Societies for the cultivation of the English language; that they are able to work is evident from the excellent treatises of Dr. Morris on English grammar and etymology. The only question is, Will any man be found capable and ready to imitate Dr. Atkinson's example of self-denial and sacrifice in producing something exhaustive? We hope we shall soon receive an answer in the affirmative.

J. H. HESSELS.

SCIENCE NOTES.

CHEMISTRY AND MINERALOGY.

The Absorption of Free Nitrogen and Hydrogen by Organic Substances.—Berthelot (*Comptes Rendus*, 1876, lxxii., 1357) finds that nitrogen, whether pure or mixed as in air, can be taken up directly by vegetable cellular tissue. Slightly moistened filter paper, when exposed with nitrogen to the influence of the silent electric discharge, takes up in the space of ten minutes quite a noticeable quantity of the gas. If the paper be subsequently heated with soda-lime the development of ammonia is easily recognised; the paper, in the original condition, did not exhibit this reaction. Ammonia is usually produced at a low red-heat by the destruction of certain nitrogenous compounds. That the presence of oxygen does not affect the reaction is shown by the following experiment. A glass tube, through which the electric discharge took place, was coated on the inside with a thin layer of a solution of dextrin, and filled with a measured volume of air; after exposure to the current for eight hours it was found that 2.9 per cent. of nitrogen and 7.0 per cent. of oxygen had been taken up. The dextrin was then dissolved off, dried and burnt with soda-lime; at a red heat it evolved ammonia. The author was unable to detect the formation of any free ammonia, nitrous acid or nitric acid whatever in any of his experiments. As during this process a nitrogenous

compound has been formed by the direct addition of free nitrogen to a carbo-hydrate, it follows from this interesting observation of Berthelot's that for the fixation of nitrogen in nature the presence of ozone, or of ammonia, or of an oxide of nitrogen, is no longer to be regarded as essential. Bous-singault, in his researches, was unable to detect the absorption of nitrogen by organic bodies. The co-operation of atmospheric electricity, however, which is usually suspended when experiments are made in glass vessels, plays a part on the surface of our globe, and the experiments which Berthelot instituted correspond more closely with a natural condition of things. Under the influence of the electric discharge, hydrogen is taken up even more readily than nitrogen: 1 c.c. of benzol absorbed 250 c.c., or about two equivalents, of hydrogen, forming a polymer of C_6H_8 .

Only a small amount of benzol remained unaltered. By spontaneous evaporation the product left a resinous residue possessing a strong, unpleasant odour; when heated it began to intumesce, without melting, and then to decompose, yielding, in the first place, a trace of benzol; then a distillate soluble in fuming nitric and sulphuric acid, and forming with water a conjugated acid; next a dense inflammable liquid; and, finally, a considerable amount of a carbonaceous residue which still contained hydrogen. Oil of turpentine absorbs hydrogen, $C_{10}H_{16}$, taking up 2.5 equivalents and yielding resinous polymeric products, which do not form hydrates. Acetylene, when mixed with twice its volume of hydrogen, condenses in the manner which has been remarked in the case of pure acetylene, a certain volume of hydrogen, however, also disappearing. The brown product of condensation which is formed appears to be a polymer $n(C_2H_2)$; the gaseous residue contains at the most not more than 2 per cent. of the original acetylene, and consists chiefly of hydrogen. If the solid product be heated in nitrogen it rapidly decomposes with development of heat, which properties serve to distinguish it from all known polymers of acetylene. There are formed: a little styrol, free from benzol (an interesting observation); a tar-like thick hydrocarbon; a carbonaceous residue containing hydrogen; and a gas containing :—

Acetylene, reproduced (C_2H_2)	4
Ethylene (C_2H_4)	8
Crotonylene (C_4H_6), and analogous substances	20

The Catalytic Action of Platinum.—De La Rive considered that platinum in the presence of oxygen became coated with a thin film of an oxide which could be reduced by hydrogen, and which was again oxidised in the presence of the former gas; and to such an alternate reduction and oxidation he ascribed the almost unlimited activity of a small quantity of platinum. The phenomena by observing which he has arrived at his view have since been found to be due to occlusion of gas; and the interesting results arrived at by Ernst von Meyer, and which have just been published (*Jour. Prakt. Chem.*, 1876, xiv. 124) have conclusively shown that De La Rive's theory is no longer tenable. Von Meyer finds when mixtures of carbonic oxide and hydrogen are oxidised that the oxygen chemically combined with platinum, whether in the form of protoxide, or oxide, or as a constituent of the hydrate of the oxide, acts quite differently from free oxygen which has been rendered active by platinum.

The Lavas of Vesuvius.—A valuable report on the chemical, mineralogical and microscopical characters of the lavas of Vesuvius from 1631 to 1868 has appeared in the *Transactions of the Royal Irish Academy*, 1876, xxvi. The authors, the Rev. Prof. Haughton and Mr. Hull, the Director of the

Geological Survey of Ireland, have examined a series of specimens which have been presented to the University of Dublin by the University of Naples through the intervention of the collector, Prof. Guiscardi, the distinguished teacher of geology and mineralogy in the Italian University. In attempting to arrive at a knowledge of the proximate composition of each of these rocks from the results of analysis, Prof. Haughton has been guided by the following considerations. Each rock is composed of unknown quantities of known minerals, recognised by the microscope, and of an unknown quantity of a paste of an unknown composition, from which it is easy to see that the unknown quantities exceed the number of our equations, and that the discussion of the composition of the rock belongs to a branch of Indeterminate Analysis. Of the numerous possible solutions, that one, it is maintained, will occur in Nature which involves the largest amount of definite minerals and the least amount of indefinite paste. Analysis of twenty specimens of lava, of various dates and from different localities, and examination of the results by the method alluded to have shown: that augite is always present in maximum possible quantity, and magnetite, eleven times out of twenty, in the minimum possible quantity; that leucite is present once only in the maximum possible quantity; and that the minerals always present are, leucite, nephelinite, or sodalite, anorthite, augite and magnetite. The potash and soda minerals, leucite and nephelinite, or sodalite, were, it is believed, formed first; then the magnesian mineral, augite; and lastly magnetite and anorthite. The mean composition of the paste is not far from $2RO, SiO_2$, which represents a very fusible basic glass, brown in colour, from the large quantity of iron protoxide which it contains. Mr. Hull's report on the microscopic characters of the lavas is illustrated with a beautiful plate of drawings of sections of isolated crystals. One section of a crystal of leucite, from the lava of 1868, shows an outer row of eight fluid cavities corresponding to the angles of the crystal, and an inner row of four fluid cavities.

Henwoodite.—We have recently received the first part of *The Mineralogical Magazine and Journal of the Mineralogical Society of Great Britain and Ireland* (Truro: Lake and Lake). Mr. Stoddart contributes a paper on the celestine of the Keuper marls, and gives a list of plants, growing in the neighbourhood of Bristol, in the ashes of which he has recognised the presence of strontium. Dr. Le Neve Foster describes the pyrological characters, and Mr. Collins gives the composition, of a new mineral which the latter has named “Henwoodite,” after the late Mr. Jory Henwood. The new species, which occurs in the West Phoenix Mine, forms globular masses of a turquoise-blue colour on limonite; the interior of each spherule is composed of limonite, enclosed in which a small crystal of quartz is sometimes found; indistinct indications of crystalline faces were observed on the other surfaces. It has a hardness of 4-4.5, a specific gravity of 2.67, and a composition corresponding with the formula $2 Al_2O_3, P_2O_5 + 2 (\frac{1}{2} CuO, \frac{1}{2} H_2O)_2, P_2O_5 + 5 H_2O$. The iron oxide, regarded as gangue, alumina and phosphoric acid were, it is stated, separated and determined by Dr. Flight's method.

“Inclusions” in Gems.—Dr. Isaac Lea has recently contributed to the *Proceedings of the Academy of Natural Science of Philadelphia*, some supplementary remarks to his paper of seven years ago on “inclusions” in gems. While his paper is to a great extent historical, it contains descriptions of some interesting specimens which he has recently acquired. He gives a representation of cavities in an emerald, each containing fluid which generally envelops two perfect cubic crystals of an unknown mineral; in each cavity it is remarked that one crystal is much smaller than the other. Cavities are very abundant in the

corundrum of Ceylon, but are stated to be quite rare in the specimens of this mineral from Franklin County, North Carolina. In the specimens from the latter locality he has observed cavities containing fluid, and in each cavity a cubic crystal the "counterfeit resemblance" of those found in emerald.

Strueverite.—This mineral, which is met with in association with a number of manganese minerals at St. Marcel, Piedmont, has recently been described by Brezina (*Wien. Anz.*, 1876, 101). It has a foliated structure, a conchoidal fracture, and is of a blackish-green colour. The hardness is between 6.5 and 7, and the crystals belong to the triclinic system and are strongly dichroic. At present its composition has not been clearly made out, but the chief constituents are known to be alumina, iron oxide, and silicic acid, with smaller amounts of lime and magnesia. It has been named in honour of Giovanni Struever, Professor of Mineralogy in the Università di Sapienza, at Rome.

CAILLETT has examined (*Comptes Rendus*, 1876, lxxxii., 1205) the ash of *Agaricus campestris*, *A. crustuliformis*, *Boletus edulis*, the truffle of Périgord, &c. The chief constituents are phosphoric acid, potash and soda; no silica whatever was found.

FOR such as are interested in the history of steel manufacture a very valuable conspectus of the various methods employed in its preparation has been prepared by Heeren, and is to be found in the *Mittheil. Gew.-Ver. Hannover*, 1876, page 109.

PHILOLOGY.

WE have received from Mr. D. Nutt two works published by Max Niemeyer, of Halle, to whose zeal and liberality (the books are not of the popular and paying class which our Clarendon Press apparently thinks it its sole function to produce) both the editors acknowledge themselves much indebted. With *Il Canzoniere Portoghese della Biblioteca Vaticana* (4to, 1875) Prof. E. Monaci worthily inaugurates his series of Selections from Roman and other libraries, for the study of the Romanic languages and literatures. This valuable and extensive collection of the songs of the long-forgotten troubadours of Portugal, of which but a sixth part had been published, is here reproduced entire, as M. Monaci says, "page for page, line for line, contraction for contraction," that scholars may have a faithful copy of the early sixteenth-century MS. which, some fragments excepted, is the sole repository of the poetry written six hundred years ago by King Diniz and his contemporaries, under the inspiration of that of Provence. The editor has given an interesting preface and some useful tables, as well as two facsimiles; but, as he has abstained from discussing the text, either as to forms or readings (we are glad to hear that Dr. F. A. Coelho is preparing a critical edition), criticism resolves itself into thanks to an able scholar for bestowing so much time and pains on a task which, though of great importance, is not of a nature to bring much fame. The book is indispensable, not only to all first-hand students of the early language and literature of Portugal, but to those of Romanic poetry in general.

THE second work is the first part of an edition by Dr. W. Foerster of the twelfth century French translation of Gregory's Dialogues (*Li Dialogue Gregoire lo Pape*), with the fragments of Moralities on Job, and other pieces, contained in the same MS. The Moralities were long ago published by Le Roux de Lincy, but the edition is not easily procurable; the Dialogues appear here for the first time, and are accompanied by the Latin original at the foot of the page. The literal, or rather verbal, character of the translation renders it of little use for syntax, but for the sounds and inflexions of early north-eastern French it is of great value. The present volume comprises only

the text—a grammatical introduction, critical remarks, and glossary being reserved for a second—but the editor has prefixed a short preface, in which he establishes that the work is in the Liège dialect. One or two of the remarks on the phonetics of the French dialects are questionable; the implied denial of the existence in Norman of *ch* from Latin *c* before *i* and *e* (where ordinary French has soft *c*) is certainly incorrect. But all Old French scholars will welcome the completion of Dr. Foerster's important contribution to our knowledge of the language.

WE have before us the three last numbers of the *Romania* (Paris), and will briefly mention their more important contents; the minor articles, and the comments on those in other periodicals, do not deserve to be passed over by the student, though they have to be so here. In the January number, P. Meyer publishes an Old French poem on the First Crusade; E. Cosquin gives the first instalment of some modern fairy-tales from Lorraine, comparing them with those of other countries; V. Thomsen examines the fate of *e + i* in different dialects of France, with some valuable results; and G. Paris reviews Scheler's editions of three of Adenet's poems. The most important article of the April number is by A. Darmesteter, on the Old French treatment of the Latin vowel preceding the accented syllable, and following another syllable; he fully establishes that, if not in position, this vowel is treated in the same way as that of the final syllable. There are also an article by A. Neubauer on the Hebrew translations of the *Image du monde*; various etymologies by J. Storm; the conclusion of a vocabulary of the modern Metz dialect, with remarks on sounds and inflexions, by E. Rolland; and a review, by P. Meyer, of Sardou's edition of Ferant's *Vida de sant Honorat*. The July number contains an interesting essay, by P. Meyer, on the influence of the Provençal troubadours on the poetry of the sister nations; a twelfth-century Lorraine text, with phonetic and grammatical notes, by F. Bonnardot; some more of E. Cosquin's modern Lorraine fairy-tales; a review, by A. Darmesteter, of Talbert's treatise on French *u*; and reviews, by G. Paris, of Scheler's edition of *La mort du roi Gormond*, and of Atkinson's *La vie de saint Auban* (M. Paris states that the care and excellent method applied by Prof. Atkinson to this important work render it, despite some serious misapprehensions, one of great merit).

Egypt and the Pentateuch: an Address to the Members of the Open Air Mission. By W. R. Cooper. (Bagster.) Mr. Cooper's lay-sermon is admirable; the matter it contains is most interesting, and the points are well put. After a learned introduction, Mr. Cooper draws attention to seven important points of contrast between the beliefs and usages of the Egyptians, on the one side, and the language of the Pentateuch, on the other. These are (1) the description of the Supreme Being; (2) the doctrine of a Trinity; (3) the character and office of a king; (4) the position and duties of the priesthood; (5) the existence of nuns; (6) the doctrine of a personal Redeemer and of a heaven and hell; and (7) the impersonation of natural objects. In all these points the contrast between Egypt and the Pentateuch is as complete as possible, and the mass of evidence brought forward by Mr. Cooper from the Egyptian monuments leaves no doubt of the fact. The Address is valuable, therefore, not only to the science of religion, but also to the criticism of the books of Moses. Taken in connexion with the Babylonian analogies to the contents of the Pentateuch that have lately been pointed out, the absence of Egyptian influence upon the Pentateuch is certainly very remarkable. Not less remarkable are the resemblances between the doctrines of Christianity and of the ancient Egyptian priests, which cannot fail to strike the reader of Mr. Cooper's useful little book.

FINE ART.

MICHELANGELO.

Le Lettere di Michelangelo Buonarroti; publiche coi ricordi ed i contratti artistichi, per cura di Gaetano Milanese. (Firenze: Le Monnier, 1875.)

Vita di Michelangelo Buonarroti, narrata con l' aiuto di nuovi documenti, da Aurelio Gotti. Two vols. (Firenze: Tip. della Gazzetta d' Italia, 1875.)

Life and Letters of Michelangelo Buonarroti. By Ch. Heath Wilson. (London: John Murray, 1876.)

(Second Notice.)

THERE are thus only two capital points, the duration of Michelangelo's work on the vaultings of the Sistine Chapel, and the circumstances of his flight to Venice at the time of the siege of Florence, upon which our newly-acquired materials correct and extend our previous knowledge. On the former point, the clear establishment of the truth is mainly the work of Mr. Wilson; on the latter, the force of the new evidence was obvious, and Signor Gotti had not failed to bring out the facts of the two journeys—the first apparently a mission, the second really a flight. To our view of the circumstances of the siege, Mr. Wilson for his part only adds the observation, most probably just, that Vasari's story of an exchange of fire between the besieging batteries and a battery of two guns established by Michelangelo on the church-tower of San Miniato, is inconsistent alike with the material dimensions and condition of the tower (which Mr. Wilson has carefully examined) and with the character of artillery practice in that age.

In the remaining history of Michelangelo's life, what new facts these publications teach us are seldom of importance, though they are often interesting to know, and the letters by which we learn them good to read. Thus there is Michelangelo's illness at Rome in 1500, an illness brought on by over-work and the privations he habitually imposed on himself in order to save every ducat he could for his family. Michelangelo's brother, Buonarrotto, had been with him, and when he got home had reported his state to their father, Lodovico. We learn about it from a letter of Lodovico, full of fussy recipes and of a paternal anxiety which, we cannot but feel, is less for the son's own sake than for the sake of his earnings. "Take care of yourself," says the father; "considering your profession, you are a ruined man if you lose your health (which God forbid!). Above all, take care of your head; keep it moderately warm and never wash yourself; have yourself rubbed down, but do not wash." Then, again, there is the grievance of Michelangelo against Luca Signorelli, of which we learn for the first time by a letter he addressed to the Captain of Cortona in 1518. In it Michelangelo complains to this magistrate that Signorelli, his townsman, having appeared at Rome five years before in hopes of patronage from the new Medici Pope, and finding himself short of money, had come to him when he was sick, and borrowed forty julians of him, and then another forty, and never

repaid them; but on application, had alleged that repaid they were. We had been accustomed to have other thoughts than this of the great painter of Cortona. Vasari had pictured Signorelli to us as a "good old man" in the midst of all that should accompany old age, as honour, love, obedience, troops of friends; and we know that he laboured strenuously and with good reward to the last. It hurts—nay it is almost impossible—to think of him in the character of a fraudulent borrower from a young and struggling brother of his craft. Can it be that the state in which he lived—"more like a gentleman and honoured lord than like a painter"—had really brought him into difficulties? Or is it not rather likely that the fraud had been committed by some third person, to whom Signorelli had in truth entrusted the money for repayment, but who had failed to deliver it? We have no clue to the sequel.

Such as they are, facts like these are new to us. There are plenty of instances of another kind, in which these new letters come in to cap the old, and tell us more about facts which we had already heard of. Among the British Museum MSS. was a letter of Michelangelo's to his father, written at the time when he was busiest with his preparations for the Sixtine frescoes, and saying that he had heard of his brother Giovansimone's misbehaviour, and would, if necessary, come to Florence to correct him; but in the meanwhile had written him a letter. That letter we now possess. It appears that Giovansimone had been rebelliously threatening his father, and had even gone so far as to attempt arson and other mischief. Simple but terrible are the sentences of the elder brother's rebuke:—

"You are no brother of mine. If you were you would not threaten our father. You are a beast, and as a beast I will treat you. Know that whoso threatens his father pays for it with his life; enough. . . . If I hear one word more of your doings, I will take post, and come and teach you how to destroy your things, and set fire to houses and goods you never worked for. . . . If I come, I will do that shall make you weep scalding tears, and teach you what right you have to be insolent. Mind, I will be better than my word. . . . Here have I been toiling the last twelve years in all parts of Italy, wearing myself out, going through trouble of all kinds, putting my life in danger, all to help our house; and you are to undo in an hour all I have done these years. Body of Christ! you shall see. Be wise, and do not tempt one who has trials enough."

Stroke upon stroke, like those which were wont to amaze beholders when his hammer made the marble fly, comes down the weight of that swift and righteous anger. Turning next to a very different time and mood—there exists a letter from Francis I. to Michelangelo, published first by De Romanis and many times since, and now deposited in the Wicar Museum at Lille; the French king sent it by Primaticcio in 1546, to ask for some work by Michelangelo's hand. We can now read the answer: "Sacred Majesty," says Michelangelo, after thanking the king for the honour done him, "I am old, and shall be busy for some months on work I am about for Pope Paul; but if I can find time afterwards, I will try my best to do what I have

long desired to do for your Majesty—viz., a thing in marble, one in bronze, and one in painting. And if my purpose is cut off by death, and if there is any carving or painting in the other world, I shall not fail of my promise there, where there is no more growing old."

Taken generally, we may say that the value of these new materials lies less in acquainting us with new events, or aspects of events, than in rounding and filling out our conception of Michelangelo's character. Not a letter but adds some touch whereby we seem to know him more intimately. In toil, in duty, in tenderness, in anger, we watch this massive and concentrated nature hurling itself with passion upon every task that comes. It seems a force to conquer worlds; but more than worlds rise up against it. Weaker men find their path made smooth before them, but nothing comes smooth to Michelangelo; there are opposing forces that hem him in continually. Amid his stupendous purposes he is always trammelled by petty cares and oppressed by stupid iniquities. The great conception of his youth, the tomb of Julius, does but realise for him a legacy of lifelong litigation and persecution. The best years of his life are wasted in quarryman's work. He denies himself everything to give to his father and brothers; they requite him with selfishness and misunderstanding. The more splendid his scheme for commemorating the greatness of one Pope, the more causeless and disheartening its abandonment. The more patient his loyalty in serving the caprices of the next, the more unworthy and exasperating the tasks which those caprices imposed. The more absolute his devotion to his kindred, the hungrier and more importunate their dependence. The spectacle of so much greatness so cruelly thwarted tempts one to call out upon the demoralisation of the times, and to wish that Michelangelo had been born in another age than that age of change and chaos, of the subversion of ancient politics and the corruption of ancient faiths. In truth, his lot was cast in evil times; but he was one of those for whom no times would have been good. His was a nature born to inevitable crosses. He was one of those who, doing good themselves with all their strength, have not the gift of making others good to them. Such men are rare at no period of the world's history. Deserving to make friends and making enemies, helping others and getting no help themselves, their powers chained to unworthy uses, their sacrifices paid with ingratitude, their claims resented, their kindnesses still more, they are shut out from happiness and live lives that seem a satire upon mankind. It is often so with the strongest; they carry in themselves some principle which provokes fate and mankind to be contrary. Their strength is fit only for giant's work, and they have not the touch, the tact, for doing acceptably the little things which gain a man the good or ill will of his fellows; or worse, they have their strength yoked to some special weakness. Michelangelo certainly had no light hand for the light things of life; but that would have hurt him less had he not had the fault of those who do not know how to make allow-

ance. Men who, like Molière's Misanthropist, insist that others shall do as they would do themselves, who cannot measure their blame nor keep their indignation proportionate to its cause, may have all other powers and virtues, but are sure to turn the world against them. For happiness, still more for success, their temperament is fatal. Michelangelo was of this family—in respect of his own conduct dutiful, self-denying, heroic, but in respect of the conduct of others exacting, sudden, resentful. He could stretch patience sometimes beyond the bounds of reason; but more often would be impatient without reason, and indignant in the wrong place. Thus, when he was almost a boy in Florence, he once construed a courtesy of Lionardo into an affront, and answered it with a sullen taunt. Thus in his old age, when he had been ill, and the nephew whom he supported and meant for his heir came to see him, he savagely wrote from his sick bed:—

"You have come to have me dead, and see whether I have left you nothing. Have you not got enough of mine at Florence? Deny it if you can. You are like your father, who at Florence drove me out of my own house. I tell you I have so made my will that you need not think of any property I have at Rome. So go, in God's name, and do not come into my sight or ever write to me again."

This passion did not last, and to the same nephew, Lodovico, is written the long series of letters, part already known, part now printed for the first time, which best acquaint us with the declining years of Michelangelo's life. Their tone is touching, as by degrees the iron frame and terrible will begin consciously to grow feebler. Sometimes Michelangelo expresses distrust of his own temper, as where, at the end of a business letter, he says he has put the affair on paper, because, if he were to come and speak before the persons concerned, he should break out upon them till there would be no heart left in him. Sometimes he fiercely accuses the world of its injustice. Writing about the galling claims of the heirs of Pope Julius—"Enough," he cries, "that for having kept faith through six and thirty years, and for having freely given myself into the hands of others, I deserve no better; painting and sculpture, toil and troth, have ruined me, and all goes daily with me from bad to worse." Sometimes his proneness to rebuke finds gentler utterance; on the christening of a young son of his nephew's he writes to thank Vasari for telling him all about it: "but I am not at all pleased at so much festivity; a man ought not to make merry at a time when all the world is weeping" (the allusion is to public affairs); "it makes me think that Lodovico has not much judgment, all this, and especially his making such rejoicings over a birth, when rejoicings ought to be kept for the death of one who has lived well." Touches of beauty and profoundness like this last are not rare in the letters. It is in the letters to his father, whom he treated with a perfectly constant and unrequited devotion, that Michelangelo's capacity for patience and sweetness comes out most, by contrast with his impetuous mood to other men. See, for a memorable example, a letter too long to quote here, written about

the year 1517, in answer to certain cruel and gratuitous accusations of this querulous parent (Gotti, vol. i. p. 209; Milanese, p. 49).

Intimate as all this correspondence makes us with Michelangelo in his life and character, it tells us nothing of his thoughts about his art. He was the inheritor of a vast tradition, the consummator of the efforts of generations in Italy; all the fire of the two great centuries before him was in his veins. He had mastered that mighty language in which those generations had been labouring to express themselves, the language of the human form; he had mastered and brought it to perfection; he knew the human body, and could paint and model it, like no man before or since. And this consummate science was the servant of a consummate imagination. Whether he is setting forth anew the old histories of creation, fall, and redemption, the old mysteries of prophecy and fulfilment, or whether he is adorning the tombs of princes with inventions of his own, it is not only that the figures he makes are of a more perfect mould than any that had been made before, but that they speak more powerfully to our spirits. The forms he drew and carved impress us with unknown meanings as majestic as themselves. We want to know from himself what those meanings are; we want to hear what thoughts were in his mind as he designed these creations that enthrall and amaze us. But he is dumb, and we must submit. These new publications add nothing to the few trite utterances we possessed before—such as his reason for attributing immortal youth to the mourning Mother of the *Pietà*; his famous lines, “Grato me ’l sonno,” on the Medici monuments; the more or less mystical expressions of a few of his sonnets on the nature of beauty and the business of the artist; and that curious prophecy, as it reads, of modern aesthetic discussions, which is contained in a reply written in his tired old age to a friend who had sent him a treatise on the relative merits of painting and sculpture. Elsewhere, his talk is not of art, but of business, of family affairs and family troubles. We see that of all the earlier painters, Signorelli has most influenced Michelangelo, and we should like to find some account of his influence; instead, we find only that fact of the outward contact of the two men and their difference about a money matter. We want to realise what was the force and tempest of the inspiration that made Michelangelo work as he did; he talks of no such thing, but only of his outward motive to industry, the desire to provide for his family. But, indeed, it is the nature of an artist’s imagination hardly to know its own meanings, and still less to talk of them. It is for others, for posterity, to interpret if they can what was at work within in that vexed and teeming brain. “The intention,” says our last biographer, in his unpretending language, speaking of the Medici monuments—“the intention of Michelangelo as to the meaning expressed by these monuments has been variously explained. In these pages what befel the artist at the time when he worked upon them, what were his political sentiments, to what level the Medici had fallen in the eyes of the ardent partisan of his country’s freedom,

have been specially dwelt upon, for nothing can be more certain than that all Michelangelo’s works were the reflexes of his thoughtful estimate of character, of the sentiments or emotions by which he was animated, and of an intellect which penetrated deeply into the meaning of every thing to which he devoted his attention.” Yes, it is that all the public tragedies of the time, and all the individual passions of the man, have gone to furrow the brows of his Prophets and Sibyls, and to fling the limbs of his fashioning into those immortal postures of endurance or disdain. Only, who shall put back into words, out of the forms, postures, and countenances in which they are incarnate, those tragedies and those passions of which he can feel well enough the presence and the power? Our last biographers have not really helped us much in this direction, nor spoken very luminously of the relations between Michelangelo’s art and the events and feelings which made up his life. Nor could the best possible biography make the bridge between the life and the art complete. What cannot be put back out of pictures into words, but must remain unspoken and unspeakable, for each spectator to feel as he can, is what constitutes the essence of the art. The best book would be that which, reflecting the currents of the time in the closest connexion with the character of the man, and describing the art with the fullest measure of exactness both as to its history and its contents, should best prepare the reader to feel Michelangelo’s work when he saw it.

Such a book has yet to be written. The work of Mr. Wilson has not any more than that of Signor Gotti, and does not profess to have, the strength and scope of a sufficient or ideal biography. But we have seen that it is to be applauded for some merits of its own; it establishes one or two special points for good, and in general gives English readers an intelligible view of the new materials and their bearing. A very valuable feature of the volume is the analytical table of contents, arranged so as at the same time to furnish a chronological survey of events more complete than that given either in the *Lemonnier* Vasari, or than in the work of Mr. Black. Here, as elsewhere, the writer has spared no pains. And the greater pains were needed because of the circumstances under which the book was produced. It was printed in Florence, at the office of the *Gazzetta d’Italia*, by printers ignorant of English; the number of errors is wonderfully small considering. Mr. Wilson has been good enough to furnish us with advance copies of some sheets he is reprinting for the purpose of a second edition, which will, when it appears, give evidence of still further care. A new illustration will be added to show how Michelangelo, in his famous youthful work of the *Pietà*, did but adopt and perfect, in the true spirit of that fifteenth century which was just closing, a motive handed down from the primitive sculptors of the thirteenth. In the index to the illustrations we find the true version of the judgment, given incorrectly in the first edition, of the Florentine Academy on the disputed statue of St. John the Baptist at Pisa,

and several additional notes on the works illustrated. The other sheets offer additions and textual corrections which we have not space to notice. The only thing we still miss is a uniform plan of reference to the letters published in Signor Milanese’s volume. In Mr. Wilson’s foot-notes the letters quoted in his text are referred to “*Buonarroti Archives*” or “*British Museum*” as the case may be; but the page where they appear in Milanese is only occasionally mentioned; it ought to be mentioned always.

SIDNEY COLVIN.

ART BOOKS.

The Fine Arts and their Uses. Essays on the Essential Principles and Limits of Expression of the Various Arts, with especial Reference to their Popular Influence. By William Bellars. (Smith, Elder and Co.) Such is the somewhat impressive title of this thickish 12mo volume, whose contents are divided into four parts: Principles; Fugitive Arts, such as Acting; the Permanent or Creative, of which the principal one, and the best treated of by the author, is “Verbal Poetry”; and, lastly, the Subsidiary or Decorative. Any single treatise embracing all the Arts labours under great disadvantages. It must be a *Briareus*, touching with all its hundred hands as many points of difference. Comparatively few men we have ever known have exhibited an appreciative sympathy with several distinct and diverse arts so as to be effectively critical in all. It is very true that Taste is the same faculty, whether applied to one or other aesthetic form; but the physical parts of man, his ear or his eye, his brain or his nervous system, are so intimately concerned in the pleasure he derives from the different developments of art that he refuses those which belong to rival senses. The reader will remember Goethe’s description of the musician living in darkness and in an empty room with propriety and happiness, while he assigns a palace filled with splendid things to the painter. Thus it is that treatises on all arts, drawing parallels between them, like *Du Bos*’ four heavy volumes so popular in the long-past days of other years, have gone out of fashion, and Mr. Bellars comes upon us with his *Fine Arts and their Uses* like a reminiscence of a critical age long past. The author is, however, of a thoroughly practical turn; he tries, indeed, to restrict himself to the consideration of the means at the command of each artist, and to express their limitations. But this point of view it is that requires the most definite and even professional knowledge. In the section on “Verbal Poetry” there is a good deal worth reading, some of it reminding us of Blair’s good, sound, old-fashioned *Lectures on Rhetoric*, but in other sections the author is manifestly at sea. We can make nothing of the following illustration, for instance, where, speaking of various architects without imagination, he says: “One constructs arches because they are strong, but with no feeling for their beauty. Another man overlays his arches with crockets and fills them with an elaborate tracery, and yet gives little pleasure to a simple thoughtful mind. At best his perception of the beauty possible to his work reaches no further than the fancy.” How is it possible to overlay an arch with crockets, or fill it with tracery?

Canova’s Works, engraved in outline by Henry Moses (Chatto and Windus), is certainly a very handsome publication, though it must be confessed that, after looking through so large a series of engravings as this from one master, we are apt to be struck perhaps more by his defects than his merits, for which reason it would have been better for the fame of Canova to give only a selection instead of this vast array. On the other hand, the larger the collection of an artist’s works, the more readily and generally will their perva ling

spirit be recognised. In the case of Canova the pervading spirit was grace of movement, or rather of attitude, which is completed movement; to this the organic beauty of form was always sacrificed, and by no means atoned for by the introduction of numerous details showing careful study from nature. However graceful an attitude may be, it necessarily lacks more or less the element of duration, and is, therefore, on that ground alone, one step removed from the repose which is the first condition of true sculpture. It is to be regretted that so beautiful a book as this should be spoiled as it is by the dismal explanations which accompany each engraving. The biography at the beginning, by Count Cicognara, is too brief to be satisfactory. If taken, not for artistic study, but as a gift-book for the purpose of giving a general idea of the works and style of Canova, this book would no doubt deserve high recommendation.

Old Manchester. A Series of Views of the more ancient Buildings in Manchester and its Vicinity, as they appeared Fifty Years ago. Drawn by Ralston, James, and Others, and reproduced by the Autotype Process. By Alfred Brothers. With an introduction by James Croston. (Manchester: J. E. Cornish.) The title-page explains fully the aim of this work. Its objects have been accomplished with considerable success. When lithography was still a young art it was employed for the perpetuation of the drawings of Manchester places executed by James and Ralston. Now these have become so scarce that it has been thought wise to call in the aid of the still youthful art of photography for their reproduction. A book of this kind can be approached from various points of view. We may regard it as an interesting document respecting two phases in the history of book illustration. The picturesque outlines of the old-fashioned buildings seem to find congenial expression in the softness peculiar to lithographic art. The reproduction is a successful one, and as it is printed in printer's ink may lay claim to a permanence unhappily denied to the ordinary products of photography. From the archaeological point of view old Manchester, as here represented, does not claim first-rate importance. The march of improvement has cleared away many quaint-gabled houses of the Tudor and Stuart period, but the Church and the College (the finest of its older architectural works) still remain in tolerable condition, though not, unfortunately, intact. In the heart of the city the changes have brought advantages far outweighing the sentimental regret that may be felt at the disappearance of Elizabethan buildings. In the small circle which enclosed Old Manchester narrow wynds have given place to broad streets in which fine buildings are plentiful. Outside the narrow boundary, however, fields and woodlands dotted here and there with the halls of the gentry have all been swallowed up. The pleasant streams are poisoned, the trees and flowers have gone; where the children used to chase the butterfly is heard now the busy hum of a hive of mankind. The meadows have been gobbled up by the "jerry-builder" and the "property-jobber," and these latest products of civilisation have given us in exchange endless miles of houses in the Victorian snuff-box style—the latest and vilest product of architectural art. This has been called the age of great cities, and it would be folly to question their right to exist, or the higher civilisation they can promote. We have to pay a heavy penalty for the benefits they confer, and it is by no means clear that they might not be obtained at a less cost. The "Manchester man," as he scans these pictures and reads Mr. Croston's pleasant gossip about them, will probably not regret the disappearance of the narrow lanes of fifty years ago. But will he feel no regret to think that the breath of the wealthy city has, like a poisonous miasma, blasted the fields and flowers that once grew close around its borders?

ART NOTES FROM PARIS.

THE organisation of the Universal Exhibition of 1878 is now definitely settled, and the staff is almost the same as on former occasions. In addition to the central office there will be four main departments: M. Krantz, the distinguished engineer, whose management in 1867 was so successful, is the chief commissioner, and to his department are annexed those of finance, registration, and sanitary arrangements. The works are under the general direction of M. Duval, those at the Trocadero being superintended by M. Davioud, architect to the City of Paris, and those at the Champ de Mars by M. Hardy. The French section is in charge of M. Dietz-Monin, ex-deputy, and M. Giraud, Conseiller-Général of the Département du Nord. The foreign section is under the management of M. Georges Berger, of the staff of the *Journal des Débats*, with M. Charles Vergé, auditor of the Conseil d'Etat, as his secretary; and the Marquis de Ohennevières is director of the Fine Arts department. The classification will be nearly the same as in 1867—an arrangement preferable to those of Vienna and Philadelphia—with the exception that class 10 ("objects exhibited specially with a view to the physical and moral improvement of the population") is suppressed. This class was vaguely intended for the encouragement of the socialistic schemes which the emperor used so skillfully to mask his home policy. It will be replaced by a special class for Education and Instruction—a subject which I need not say is of high interest in the new order of Republican France.

Eugène Fromentin, the painter, has, as mentioned last week, just died somewhat suddenly in Brittany of a carbuncle on the lip. He was born at La Rochelle in 1820, and brought up in the studio of the landscape-painter M. Louis Cabat, now a member of the Institute, who was then a Romanticist. But Eugène Fromentin is more directly than any other of the French painters of the day a true pupil of Eugène Delacroix. He began very brilliantly. He made several journeys to Algeria, into the Sahel and Sahara, and the pictures of Arab life and scenery which he brought back from them were distinguished by their extreme delicacy of feeling. What struck him more especially was the elegance of the thoroughbred horses and the grand and heroic air of the chiefs. During the last few years Fromentin had seemed anxious and worn, and his works showed less originality. In the *Vues des Bords du Nil*, which he exhibited at the last Salon, both figures and scenery are alike feeble and dull, and his old admirers found it difficult to recognise in them the once clever draughtsman and brilliant colourist.

Fromentin was gifted with a very critical understanding and was also a good writer. He published a book called *Un Été dans le Sahara*, in which the action of the physical phenomena of African heat and light on the body and brain of a European artist is described with masterly truth of observation; and another called *Une Année dans le Sahel*, which contains some fine pages; besides a novel entitled *Dominique*, which for sadness and depth of feeling reads like a narrative of personal experiences. Very recently he published in the *Revue des Deux Mondes* a series of notes of travel through the museums of Holland and Belgium, which he reprinted in one volume under the name of *Maîtres d'autrefois*. These criticisms have attracted a great deal of notice among artists. Considering the freedom and originality of his judgment on Rubens and Rembrandt, it may be doubted whether the doors of the French Academy, at which Fromentin was unwise enough to knock like M. Charles Blanc, would ever have opened to him. He was rejected as not being sufficiently classical, and that rejection, which had been foreseen by all his friends, embittered the last years of his too brief life.

PH. BURY.

NOTES AND NEWS.

MR. WEDMORE'S new book, which is not a work of fiction, but a series of studies in English art, will be published, we hear, next month by Messrs. Bentley. The English artists Mr. Wedmore has written about are those chiefly of the eighteenth century and of the last generation.

MR. WHISTLER writes:—

"I have read with much gratification the truly appreciative article in your paper referring, with thorough understanding, to some decorations of mine at Prince's Gate; but crave your permission to make clear one fact, important in this matter. The design of the elegant and beautiful framework in Mr. Leyland's dining-room is by Mr. Jeckyll, the distinguished architect, to whose exquisite sense of beauty and great knowledge we owe the well-remembered 'Norwich Gates,' and whose delicate subtlety of feeling we see in perfection in the fairy-like railings of Holland Park. If there be any quality whatever in my decoration, it is doubtless due to the inspiration I may have received from the graceful proportions and lovely lines of Mr. Jeckyll's work about me."

THE annual meeting of the Yorkshire Archaeological and Topographical Society was held at Halifax on Wednesday last week, under the direction of the hon. secretary, Mr. Fairless Barber, F.S.A. The first paper read was on the history and antiquities of the church, which is of fine proportions and of great length. The oldest part of the present structure is assigned to the thirteenth century, as the windows on the north wall of the nave aisle show something of the transition from the Early English to the Decorated. The chantries and altars, the registers, &c., were referred to at some length. The registers date from the sixteenth century, and record the burial of many people in front of their own dwellings, who died of the plague; of others who were beheaded under the Halifax Gibbet Law. This law is described by an old traveller as "that privilege of heading any malefactor taken (as they say) hand-napping, back bearing, or confessing the felony;" it was granted in order to protect the clothiers' trade there. The same writer thus describes the place and mode of execution:—

"Their heading block is little out of town westward; it is raised upon a little fore'd ascent of some halfe a dozen stepps, and is made in forme of a narrow gallowes, having 2 ribbs downe either sidepost, and a great waightie block wth Riggalds for those ribbs to shoote in, in y^e bottoome of w^{ch} blocke is fastned a keene edged hatchet, then the Blocke is drawne up by a pulley and a cord to y^e crosse on y^e topp, and the malefactor layes his head on y^e block below; then they let runne the stock wth y^e hatchet in, and dispatch him immediately."

This form of execution bears a very striking resemblance to the favourite one adopted during the French Revolution, for the invention of which Dr. Guillotin gets all the credit. The archaeologists, after inspecting these curiosities, visited Shibden Hall, partly timber-built, dating from the fifteenth century, the windows of which contain much ancient armorial glass. At the Halifax Museum were exhibited many old deeds and manuscripts, chiefly of local interest, and a collection of tiles and pottery from the Roman station of Cambodunum. The church of St. Mary, Elland, was also visited. The east window was formerly filled with stained glass, illustrating the life of the Virgin Mary; and Mr. Fowler, who read a paper on the subject, regretted much the "restoration" which had taken place, the whole character of the subject having been mistaken by the artist. It was announced that the Society contemplated the exploration of the site of Byland Abbey—a work never yet undertaken.

It is proposed to hold an exhibition in Paris that shall embrace all the various branches of book-manufacture. This will include specimens of calligraphy, printing, paper, engraving on wood and on metal, chromolithography, and different kinds of binding. Products of every age and

country will be exhibited, from the Egyptian papyrus and ancient tablets of wax to the modern-bound volume and contemporary journal. A large collection of specimens of binding is also contemplated, from the iron-clasped tome of Mediaeval times to the paper-covered novel of today. It is hoped that the exhibition will be ready to be opened immediately after the close of that of the Union Centrale des Beaux-Arts, in the Palais des Champs-Élysées.

ANOTHER exhibition of somewhat similar character is being organised at Prague. It is proposed to exhibit as large a collection as can be got together of periodical publications and choice autographs. Italy and Spain have both contributed largely to this undertaking, the Typographical Society of Madrid having sent copies of several hundred journals—among which is a specimen of the first journal printed in the Peninsula, in 1661—and the town of Milan a collection of more than 1,200 Italian journals and weekly papers, and a very interesting series of autographs.

THE monument to Henri Regnault, of which we have before given a short description, was inaugurated on August 12 at the Ecole des Beaux-Arts, in the presence of a large number of notabilities, both artistic and literary. An eloquent discourse in memory of the young artist and hero was pronounced on the occasion by the Director of Fine Arts. The principal feature of the monument is the allegoric figure of Youth by M. Chapu; the single inscription upon it besides the names of the young students who fell in the war is the word *Patrie*. The attitude and expression of the bust of Regnault are said to accord well with the symbolical character of the rest of the design.

AN exhibition of art-industry has been lately opened at Cologne, comprising works of art up to the end of the eighteenth century. The Rhenish provinces, Westphalia and the Netherlands have furnished the largest contingent. Four rooms of the Casino are filled with tapestries, arms, ceramic specimens, objects of metal work and wood carvings. Among others are the celebrated treasures of art of the Cathedral of Cologne, the bronze seven-branched candlestick, gift of the sister of the Emperor Otho III., and other precious antiquities of the Minster of Essen, the rich chasubles from St. Victor, at Xanten, a large collection of glass and porcelain, and a magnificent assemblage of tissues, among which are some of Persian fabric dating from the sixth century.

THE museum at Sèvres is about to receive a collection of the enamels and faïence used for domestic purposes in China. This curious collection will serve to show the present state of the common pottery wares in China.

THE commission appointed to report upon the present condition of the Tuileries have decided that all the ruins shall be cleared away before the Universal Exhibition, and a building be erected the whole length of the old structure to be used as a museum, the ground floor being converted into an open gallery to serve as an immense promenade.

Greek River-Worship is the title of a paper lately read before the Royal Society of Literature by Mr. Percy Gardner, and now published. The subject was obscure before, and there are points where, after all that has been said, it is obscure still. Take, for example, the connexion between river-gods and music, the existence of which Mr. Gardner endeavours to prove. As an instance bearing directly on the point he quotes the god of the river Marsyas, who is represented on late coins holding the flute. But here there is reason to suspect a case of confusion or theocrasy such as was common in late times. On the one hand there was the river Marsyas with its local deity; on the other hand there was the myth of Apollo having flayed alive the Satyr Marsyas for presuming to test his musical skill against that of a god. The identity of the name, and the no great difference of form

and personal habits between a Satyr and a river-god, would have been sufficient in times of theocrasy to lead to a local coalition between these two personages. But the coalition was only local and obviously forced. The myth remained unaffected thereby. It was still the story of Apollo and Marsyas, without local *habitat*, and showing, like the other myths of a contest between Athena and Marsyas, between the Muses and Sirens, and between the Muses and the daughters of Pieros, that the ancients for some reason associated with music the notion of contests of skill in which the vanquished were always cruelly handled. Whether this general feature of the myth is consistent with Mr. Gardner's explanation is a question on which at present we are in doubt. He says: "Science and education, which are here, as ever, represented by Apollo, easily vanquish the uncultivated strains copied by rustic pipers from the sounds of nature, the babbling of rivers, and the sighing of winds, untouched by human thought and untransformed by culture." Now, if we admit the possibility of the figure of Marsyas with his flute being nothing more than an instance of local confusion or coalition, it is clear that we must not regard it as evidence of any general connexion between river-gods and music; still less so when it is the only example given as completely answering this purpose. What Mr. Gardner adds about nymphs of springs being associated with music, and contrariwise of the Muses being associated with springs, is not to the point, since nymphs and Muses are very different from river-gods, and springs from rivers, in mythology. The most valuable part of the paper, we do not hesitate to say, is that which deals with the representations of river-gods in ancient art. Hitherto we knew only of two classes of river-gods—those in the form of a bull with human head, which is apparently the older form, and those represented entirely in the human figure, this latter class being again divided into aged bearded figures, and youthful figures resembling the young Dionysos. Among the river-gods Mr. Gardner gives (plate i. figs. 17 and 20) two heads of youthful figures, both having horns projecting from above the temples. We should wish to have been told whether the horns here have anything to do with the identification of these heads, or whether without them the identification is incontrovertible. If the latter, then it will be interesting to find, contrary to the usage of sculpture, examples of anthropomorphic river-gods retaining the horns characteristic of the taurine gods. If the horns are an argument for identification, we should have wished to hear the question discussed: the more so since in one of the examples (fig. 17) the horn seems moveable and attached to the diadem; which reminds us that the young Dionysos sometimes wore horns so attached. Ovid addressing him (*Metam.* iv., 19-20) says

"— tibi cum sine cornibus adstas
Virgineum caput est —"

The head on the coin in question, were the horns removed, would be strikingly a *virgineum caput*. Among the epithets of Dionysos were *χρυσόκερως*, *ταυρόκερως*, *βοῦκερως*. With reference to a statement on p. 34, we may add that the Orontes was previously called Typhon, and that its bed was said to have been formed by him when wounded and dragging his snake's body along the ground. Finally, we rest our apology for these criticisms on the high value which we set on the other parts of the paper.

THE STAGE.

THE quietude of the week at the London theatres has been broken by nothing more startling than the appearance, at the Haymarket, of Mr. John S. Clarke, the American comic actor. Mr. Clarke elects to rely on quite familiar impersonations. He has appeared this week as Dr. Pangloss, in the *Heir-at-Law*, and in *A Widow Hunt*, which is only a new name for Mr. Sterling Coyne's comedy,

Everybody's Friend. The second piece is that in which the now favourite American actor first acted in London, the time being 1867, and the place the St. James's Theatre. It is interesting to remember that Mr. Irving and Miss Ada Cavendish then appeared as representatives of secondary characters in the same play. Mr. Clarke became at once rather popular. Since then he has confirmed his hold over that section of the playgoing public which is not offended by extravagance. He has a funny face, an immense practice, and the tricks of the stage are at his fingers' ends. He plays what is really farce with the true farcical spirit, and he plays comedy so that one does not know it from farce. He has not much variety, but is persistently eccentric and perseveringly grotesque.

MR. W. CRESWICK has been acting Hamlet at the great Standard Theatre. We hear that the actor will before long assume the management of a suburban theatre—the "Park Theatre," in Camden Town: a pretty house, which has never thus far flourished very much, except when devoted to the art which is furthest from that of Mr. Creswick's—that of the agile Sara, sometime of the Alhambra.

MR. HENRY IRVING is accompanied on his provincial tour by Mr. T. Swinbourne, and Mr. Swinbourne plays the Ghost to the Hamlet of Mr. Irving.

MR. AND MRS. KENDAL have just been acting at Glasgow, where their performance in *A Scrap of Paper* was received enthusiastically.

ONE of the best organised companies now "starring" in the country is that known as the "Pygmalion and Galatea Company," because it is empowered to represent this and other favourite pieces of Mr. Gilbert's. The company has just finished a successful engagement at Leicester, where the acting of Miss Rose Leclercq as Galatea has been admired as much as elsewhere. This lady, who is perhaps deficient in the force often required for drama, and who is not at her best in every-day comedy, is very happily chosen as the representative of the poetical heroines of Mr. Gilbert's blank-verse plays. She is said to have made an excellent Vavir, in *Broken Hearts*. The company includes Mr. F. Marshall and Miss Florence Terry. The first, in *Pygmalion and Galatea*, plays Chryso—the part made laughable by Mr. Buckstone in London: and Miss Terry acts sympathetically the part of Pygmalion's wife, of which Miss Roselle made so much at the Haymarket.

MR. TOOLE, who is now in Switzerland, will play in Manchester next week.

HERR BANDMANN is going back to Germany, and will play Hamlet, says the *Era*, in his native tongue, at Berlin.

THE death is announced, at the age of thirty-nine, of Mr. George Beckett, the comedian.

THE Council of the Royal Dramatic College is making efforts to raise money. Some of our readers may like to know that the College exists for the support of twenty infirm and old actors and actresses. For lack of funds only thirteen are now in it, and these, it is feared, must leave unless more money is forthcoming. It is proposed that certain London and provincial theatres shall pledge themselves to give the institution an annual benefit, and the managers of some of these have just now signified their willingness to do so.

THE theatrical season in Paris is beginning. The Odéon Theatre has re-opened, though not with so interesting a programme as former managers used always to arrange for September 1. It was until lately the custom to begin the season with a new important drama, and with a one-act piece by an author of promise, and then, within a few days of the first of the month, to show what the newly-strengthened company could do in the habitual repertory. All this is changed. M. Duquesnel—the recipient of a subsidy and the occupant, rent-free, of one of the finest

theatres in Paris—closes one season with the one hundred and fiftieth performance of a piece, and begins another with the one hundred and fifty-first. In other words, the *Danicheff* is again before the audience of the Quartier Latin. Slight changes only have been made in the cast since we saw the piece here at the St. James's: slighter still since its last performance in Paris. The part of the Countess, played magnificently in London, Marseilles, and Lyons by Mme. Fargueil, for whom it was in the first place written, is now resumed by the lady who has been accustomed to play it at the Odéon. But the Odéon has lost the distinguished young actor who played the Countess's son. He is succeeded by M. Regnier—no relation, indeed, of the famous ex-comedian of the Français and professor at the Conservatoire, but an actor who has been accepted as a good *jeune premier* at one of the second-rate theatres. He is out of place at the Odéon. The actor who represented the Serf in London and Mdlle. Hélène Petit, the heroine, are condemned apparently to one of those endless repetitions which spoil artists, and against which, whether they are to be noticed on the Paris or on the London stage, we do not cease to protest.

M. CASTELLANO has reopened the Théâtre Historique by a first representation of *Marceau, ou les Enfants de la République*, a five-act play by Anicet Bourgeois and Michel Masson. The piece is really a reproduction. It dates from the year 1848, and was played at first for one night only—the “terrible days” of the Revolution having begun before the second evening, and theatrical representations being for the moment suspended. Its performance at the present time is perhaps chiefly remarkable for the appearance of the very young actor Chelles in the part of a priest, “qui ne porte pas l'habit.” The Parisian critics predict a brilliant future for the young man. He was first seen three years since, at the “Matinées Ballande,” and Ballande, the director of these now famous performances, drew the attention of the critics to M. Chelles. He afterwards went to Cluny, and has had a short engagement at the Gymnase; but the Français or the Gymnase will probably claim him before long.

OF the lighter pieces now played in Paris the *Princesse de Trebizonde* is perhaps the most talked about, but we hear that many visitors cannot find in a second visit the freshness or satisfaction of their first impression. The *Princesse de Trebizonde*, indeed, is hardly one of the pieces that might be expected to improve with time. Opéra-bouffe strikes at once, or strikes never. *Estelle et Némorin*, another piece of the same nature, has fallen flat on the first representation.

MDLLE. JEANNE GRANIER has returned to the performance of *La Petite Mariée*—Lecocq's piece—at the Renaissance. Never, probably, was an actress better fitted with a part, or a part with an actress.

A NEW piece by M. Paul Ferrier will be brought out immediately at the Gymnase.

A DAUGHTER of Edouard Plouvier has lately made her first appearance on the Paris stage, but at an unimportant theatre, and in a piece which could not retain possession of the boards. Plouvier was an author whose maturity did not fulfil the promise of his youth. We saw one of his last pieces—the *Salomandre*—at the Odéon, where it quickly failed. His talent was dead.

MUSIC.

THE BIRMINGHAM FESTIVAL.

(Concluding Notice.)

Birmingham: Thursday, August 31.

Niels Gade's cantata *Zion*, the third of the novelties specially composed for the present festival, opened last night's concert. Herr Gade, who con-

ducted the performance of his own work, is well known to musicians as the first of living Danish composers. Born at Copenhagen in 1817, his name first became known through his overture *Nachklänge an Ossian*, which in 1841 received the prize offered by the Copenhagen Musikverein, the judges being two no less eminent musicians than Ludwig Spohr and Friedrich Schneider. The work was soon afterwards produced under Mendelssohn's direction at the Gewandhaus Concerts in Leipzig, and his reputation in Germany was at once established. On Mendelssohn's death, Gade succeeded him as conductor of the Gewandhaus Concerts; but in 1848 he returned to his birth-place, where he has since resided, occupying himself with teaching, conducting, and composing. His chief works are eight symphonies, four concert-overtures, several large vocal works, among which the cantatas *Comala* and *Erlkönig's Tochter* are probably the best known, and numerous smaller works, both vocal and instrumental. Gade's style has considerable affinity with that of his friend Mendelssohn, of which, however, it is by no means a mere imitation. We find the same charmingly-finished workmanship, the same true artistic feeling. Nevertheless, it cannot be denied that Gade is a somewhat unequal writer; and I am hardly disposed to consider *Zion* one of his happiest efforts. The work consists of an introduction and three choruses, entitled “The Departure from Egypt,” “The Captivity in Babylon,” and “The Return—Prophecy of the New Jerusalem.” The music is laid out on a large scale, and with a view to those broad effects most suited for such a festival as the present. From the first to the last bar the hand of a true musician is to be traced; but there is little real inspiration in the cantata: it sounds like music written to order. An exception must, however, be made in favour of some isolated passages of great beauty, such as the last part of the first chorus, from the words “Like as a flock He hath gently led his people,” the introduction of No. 2, and the solo which commences the finale. As a whole, I expect to find *The Crusaders*, which will be given to-night, a work of decidedly higher value. The performance of *Zion* was excellent, the chorus sang with great spirit and finish, and the solo was given in his best style by Mr. Vernon Rigby. The rest of this concert consisted of a miscellaneous selection requiring no comment; neither is it needful to enlarge upon the performance of the *Messiah*, which has taken place this morning.

Friday, September 1.

Last night's performance of Gade's *Crusaders* fully justified the conjecture I made yesterday. The cantata is a work of genuine inspiration, in which the composer is heard at his very best. The subject is taken from Tasso's *Jerusalem Delivered*, the original German text having been compiled by Carl Andersen, and the English version skilfully adapted by the Rev. J. Troutbeck. The work is divided into three parts, and contains in all twelve numbers, occupying about an hour and a quarter in performance. The first part, “In the Desert,” opens with a very characteristic chorus, “Flame-like the sand-waste glows,” depicting the sufferings of the Crusaders. Peter the Hermit (bass) comforts them with a solo, “Soon our God success will send us,” which is musically not very striking; it is followed by a most spirited martial song for Rinaldo (tenor) with chorus, “Shine, holy sun, shine on my trusty sword,” which is one of the most effective numbers of the work. The following prayer, “Father, from a distant land,” is in admirable contrast with the preceding, thoroughly devotional in tone, and bringing the first part of the cantata to an excellent conclusion. The whole of the second part, entitled “Armida,” is a masterpiece. It opens with a chorus of spirits summoned by the enchantress, “Silent, creeping so light,” of a most weird character, and instrumented with rare felicity. After a fine solo for Armida (mezzo-soprano), “They softly sleep,”

we reach what will probably be considered the gem of the whole work—the lovely chorus of Sirens, “The wave sweeps my breast.” Here melody, harmony and orchestration are alike admirable; indeed, it is not too much to call them perfect. The next number, which concludes the second part, is the scene of the attempted seduction of Rinaldo by Armida and his rescue, when on the point of yielding, by his hearing in the distance the hymn of the Crusaders, “Of Heaven the faithful soldier am I ever.” The whole of this scene is treated with masterly skill and great dramatic feeling; the music is, indeed, really delightful. Here the culminating point of the interest is reached; for the third part of the work, “Towards Jerusalem,” though containing much excellent music, must be pronounced as a whole inferior to the preceding. The performance of the entire cantata was again most excellent. The solos were given by Mme. Trebelli-Bettini, Mr. Vernon Rigby, and Signor Foli, and both choir and orchestra did full justice to the music. Its reception by the audience which crowded the hall to the doors was most enthusiastic, the composer, who again conducted, being applauded with a warmth which he is not likely soon to forget.

This morning's programme has been indeed a feast of good things. It opened with the *Last Judgment*, the best of Spohr's three published oratorios. Taken as a whole, the performance was the finest I have ever heard in my life. It is only due to Sir Michael Costa to say that there was a refinement in the accompaniments which has at some other performances at this festival been painfully wanting; in this work the delicacy was all that could be wished, excepting that the player on the bass trombone seems quite unable to produce a *piano*, and blows forth incessantly in the most unfeeling way. Perhaps he thinks he shall be heard for his much speaking—he certainly is. Curiously enough, the only number in the work which went badly (the quartet and chorus “Blest are the departed”) was encored by the President, who would seem to have a partiality for music sung out of tune, as he also encored on Wednesday morning the worst-sung chorus in Macfarren's oratorio, for which, however, the blame was largely due to the organ. The system which prevails at many provincial festivals of leaving the power of encoring with the President seems to be a very absurd one. Encores are a nuisance under all circumstances; but, if they are to be allowed, surely the matter should rest with the whole audience, and not with one gentleman who may either know nothing at all about music, or have very peculiar tastes. The solos in Spohr's oratorio were sung by Mdlle. Titiens, Mme. Patey, Mr. E. Lloyd, and Mr. C. Tovey.

To the *Last Judgment* succeeded a highly interesting novelty—new at least for England—Wagner's Scriptural scene, *The Holy Supper of the Apostles*, or, to give a more accurate translation of the original German title, “The Love-Feast of the Apostles.” This work, Wagner's only contribution to sacred music, was written in 1847, and is therefore contemporaneous with *Lohengrin*. It is for male voices and orchestra, the first half of the work being intended for unaccompanied voices. The subject of the scene is taken from Acts iv. 23–31. We have first the meeting of the disciples, who greet one another in the name of the Lord. To them enter the Twelve Apostles, who announce that they are forbidden to teach in the name of Jesus of Nazareth on pain of death. All unite in prayer; the place is shaken where they are sitting, and the Holy Ghost descends upon them. The first half of the music, which is for unaccompanied voices, is of truly extraordinary complexity and difficulty of intonation; and the entry of the orchestra for the first time in the *finale*, depicting the shaking of the place, is of overpowering effect. The whole work shows that strong dramatic feeling which is Wagner's chief characteristic; it is most

magnificent, though it may perhaps be open to the objection that it is ultra-dramatic for sacred music. It would be untrue to say that the performance was altogether satisfactory; still, considering its really enormous difficulty, we may fairly say that it was creditably sung. As it would have been absolutely impossible for unaccompanied voices to keep up the pitch during three long movements, they were supported by the organ. The result was not wholly satisfactory, as I understand the pitch of the organ has been recently lowered; consequently, through the whole festival it has seldom been properly in tune with the orchestra, and the effect has been frequently excruciating. The last movement of Wagner's work, in which the orchestra joined the voices, was excellently given, though I cannot help thinking the *tempo* was decidedly too slow.

The morning's concert concluded with Beethoven's Mass in C, wrongly entitled in the programme "Missa Solennis," a name which belongs to the second, and greater, Mass in D. The "Kyrie" was most delightfully sung and played; and I was anticipating a great musical treat, when on the commencement of the "Gloria" I found that Sir Michael Costa had actually added trombone parts to the score, being apparently of opinion that Beethoven did not know how to write for an orchestra! Of such an outrage to art I dare not trust myself to speak; I will, therefore, only say that, like Naaman, I turned and went away in a rage, and am, consequently, not able to give any further details of the performance.

To night the festival will come to an end with Mendelssohn's *St. Paul*. Of this well-known oratorio it will be superfluous to speak; I will, therefore, only say that the solo parts are to be taken by Mdle. Titiens, Mdme. Lemmens-Sherington, Mdme. Patey, Messrs. E. Lloyd and Rigby, and Signor Foli, and will conclude this article with a few general remarks.

On the whole, the festival of the present year may fairly be regarded, both as regards programmes and performances, as fully worthy of the reputation of Birmingham. It is true that the miscellaneous parts of the programmes might, from an artistic point of view, have been easily improved; but it is only fair, as I last week made a remark upon this subject, that I should put on record the defence of the committee. A gentleman to whom I spoke here on the matter answered me, "Well, you see, we have here to suit all tastes; we want to get as much money for our charity as possible; and there are many to whom 'Home, sweet home,' or 'O Nannie, will thou gang with me,' would be far more attractive than any classical music." This is certainly a satisfactory explanation, if not an entire justification, of some of the items which found their way into the programmes, giving them an appearance that reminds one of nothing so much as those patchwork counterpanes which our grandmothers delighted to work. By its production of novelties Birmingham has this year added to our *répertoire*, in Cowen's *Corsair*, Macfarren's *Resurrection*, and Gade's *Crusaders*, three valuable works, which are likely to live. If *Zion* and the *Holy Supper* have not the same popularity, the reason must be sought in the works themselves, the first being somewhat too uniform in tone, and the second certainly too difficult, to be likely to obtain frequent hearing. The singing of the Birmingham chorus has been in general excellent. It was less good on Tuesday than it has been since; but this is to be accounted for by the fatigue resulting from a rehearsal of some eleven hours on the Monday. It would be well if the committee could modify this arrangement at future festivals. One rehearsal with orchestra of five large and important works in the same day cannot produce a satisfactory result. However well the chorus may have sung the music with the piano, the effect of the full band is so different that at first the voices are liable to be put out by the novel accompaniment.

It has been suggested by a contemporary that two days instead of one should be devoted to rehearsal; and it would certainly be well if this suggestion could be carried out. Of the coarseness of the band, which is not their own fault, I have already spoken, and therefore need not dwell upon it again.

It is satisfactory to hear that the financial results of the Festival are very good, the gross receipts having amounted to 14,285*l.* 10*s.* 3*d.*
EBENEZER PROUT.

FÉLICIEN DAVID, the well-known French composer, died on the 29th ult. at the age of sixty-six. He was born at Cadenet (Vaucluse) on April 3, 1810; he entered the Conservatoire of Paris in 1830, and studied under Lesueur, Fétis, Benoist, and Reber. His most popular work, the symphony entitled *Le Désert*, was produced in 1844, and his *Christophe Colomb* in 1847. He also composed the following operas—*La Perle du Brésil* (1851), *Herculanum* (1859), *Lalla Roukh* (1862), and *Le Saphir* (1865). In 1869 he was elected successor at the Institute to Hector Berlioz.

THE Bristol Triennial Festival will be held on October 17, 18, and 19 this year, under the conduct of Mr. Charles Hallé, who takes down his band of eighty performers. The services of the following vocalists have been secured for this occasion:—Mdle. Titiens, Mdme. Edith Wynne, Mdle. Albani, Mdme. Trebelli-Bettini, Mdme. Patey, Mr. E. Lloyd, Mr. Harper Kearton, Mr. W. H. Cummings, Herr Behrens, and Mr. Maybrick. The chorus will be supplied by the Bristol Festival Choir. The programme will be as follows:—

"Tuesday morning, October 17, Mendelssohn's *Elijah*; evening, Verdi's *Requiem*, and a miscellaneous selection, including Mozart's 'Jupiter' symphony, and the overture to *Obéron*. Wednesday morning, *Israel in Egypt* (on this occasion the chorus will be increased to 500, in order to give due effect to the grand double choruses); evening, a miscellaneous selection, including Beethoven's 'Pastoral' symphony, and the overtures to Wagner's *Tannhäuser*, Spohr's *Jessonda*, and Mendelssohn's *Hebrides*. Thursday morning, Spohr's *Fall of Babylon*, and Beethoven's *Egredi*; evening, Mendelssohn's *Hymn of Praise*, and a miscellaneous selection. On Friday morning the Festival will be brought to a close with the performance of Handel's *Messiah*."

It is reported that arrangements have been made for the production in its entirety of Wagner's "Ring des Nibelungen" at Munich, in the months of August and September next year, in addition to the separate performances to be given at that place of *Siegfried* and *Götterdämmerung*, in the months of April and June respectively. The report, however, appears to lack confirmation, and is reproduced by the *Musikalisches Wochenblatt* "with reserve."

SOME part of Wagner's Trilogy (probably the *Walküre*) will also be shortly produced at the Leipzig Theatre.

ACCORDING to published accounts the Musical Festival lately held at Antwerp appears not to have realised the expectations of its promoters, either as regards the amount of public support received, or the merits of the performance, which latter has been somewhat severely criticised in some Continental journals.

GUSTAV SCHMIDT, of Leipzig, has been appointed by the Grand Duke of Hesse Darmstadt Music Director of the Court for life, and has been decorated at the same time with the Cross of the Order of Philip the Gracious.

THE death has been recently announced of Luigi Biscardi, composer and organist, and prior of the Abbey of Monte Cassino.

THE talented flautist Louis Joseph Coninx died at Paris, in his seventy-third year, on August 19 last.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Through Bosnia and the Herzégovina on Foot during the Insurrection. By Arthur J. Evans, B.A., F.S.A. (London: Longmans & Co., 1876.)

OF this book we can say, as the author does of Ragusa, "it far surpassed our most sanguine expectations." For we had expectations. Although the perusal of his book was in every sense our first introduction to Mr. Evans, and though it is notoriously unwise to put one's trust in title-pages, there was something in the title of the work before us which made us hope that the author had gone to the root of the matter, instead of merely playing on the surface and putting us off with hasty sketches of the better-known countries which surround the seat of the present insurrection. Of course it is the work of a tourist, not of a resident. But such work has, in some respects, advantages over that of a resident, whether native or foreigner; especially when the tourist is so well fitted for his task as every page of his book shows Mr. Evans to be. Some writers of books of travel are strong on history and sociology, some on scenery and art, but this writer is "shod," as the French say, on both points. Wherever he goes he carries with him the eye of an artist and the memory of an historian. His "Historical Review of Bosnia," which by an excellent arrangement is prefixed to the account of the actual tour, seems to us the model of what such an essay should be. His disquisitions on "pots and pans," on amulets, and on costumes, are well introduced and to the point. His descriptions of scenery are most fascinating, almost too much so, as they may lead others to "try Bosnia" who are not so well able to support fatigue, vermin, and insufficient food, as the author and his brother seem to be. Lastly, the intending reader will be glad to learn that from a material point of view the book is "got up" so as to set off to the best advantage its literary qualities. To say nothing of paper and type—though they are not to be despised—the illustrations "from photographs and sketches by the author" add considerably to the enjoyment of the text. The map, too, is eminently practical and confines itself to illustrating the itinerary described in the book. Even MM. Frilley and Wlahovitj, in their excellent work *Le Monténégro contemporain*, follow the shabby practice of prefixing a ready-made map which does not illustrate the text or, indeed, agree with it in orthography.

Mr. Evans tells us in his preface that his tour was undertaken rather in spite of the

insurrection than by reason of that event. It was suggested by the interest which previous visits to other South Slavonic lands led him to take in the subjects of the Sultan belonging to that race. These previous tours have enabled him to illustrate the costume, customs, &c., of the people described in the book before us, by comparisons with the Slovenes of Carinthia, Carniola, Istria, and the valley of the Isonzo, with the Serbs of Free Serbia and the Roumans of Transylvania, Moldavia and Wallachia. Nor is his experience limited to these cognate populations. Beside such familiar ground as Italy, the Tyrol and North Germany, Mr. Evans knows the shores of Lake Enare and the White Sea. At the same time it were to be wished that he had more precisely defined his linguistic qualifications for his task. As he in one place talks of airing his Bosniac in an attempt to order dinner, and as he often had to ask his way from peasants in out-of-the-way places, he evidently has some knowledge of the South Slavonic language. At any rate, he never seems to have been reduced to that "impuissance ridicule" to which M. Yriarte was reduced by his complete ignorance of all Slavonic languages when travelling a few weeks later in the same country. When introduced, however, to a Mudir who only spoke Bosniac, Turkish, Arabic and Modern Greek, our English traveller was forced to converse in "the language of Thucydides," and found it on the whole better to make use of a Montenegrine who had picked up a little Swabian as an interpreter. He seems to have generally used Italian or German in his more unrestrained conversations, although he once made the acquaintance of a Kaimakâm who spoke French "full feteously."

At the risk of incurring the reproach of "chauvinism" we must attribute the general impartiality and "objectivity" which characterise the book to the fact that it is written by an Englishman. Recent German writers on the East of Europe, such as MM. Franz Maurer and Franz von Löher, too often remind us of the Pharisee's opinion of the publican. Besides, as, to use Mr. Evans's own expression, they "look on Austria as a mere warming-pan for them in Eastern Europe," their judgment of the present state of things is further disturbed by their anticipations of future triumphs. Frenchmen, on the other hand, are generally affected by prejudices, which may not unfairly be described as either sentimental or conventional, in favour of Christianity in general and Roman Catholicism in particular. From such prejudices our English author is quite free. Although his book abounds with instances of Mohammedan—or, as he prefers to spell it, Mahometan—cruelty and misgovernment, he recognises the good qualities of the Moslems, especially their superiority in politeness and natural dignity to their Christian brethren. This superiority he attributes to "the grand Oriental traditions with which their conversion to Islâm has imbued them." In his "Historical Review of Bosnia" he shows how the history of that country illustrates his motto—

"Tantum religio potuit suadere malorum,"

or, as he himself puts it, "has been one long commentary on the evils of established religions;" and he takes the "opportunity of deprecating any sympathy with those who propose to deal with the Mussulman population of Bosnia in a spirit of Christian fanaticism." At the same time he warns us against the "grievous error" of supposing that the influence of Islâm is superficial in Bosnia, and that the religious convictions of its Slavonic Mohammedans are not deep-rooted. "Under whatever government Bosnia passes, it is safe to say that the Mahometans will still form a powerful minority, all the more important from having possession of the towns." These warnings are certainly much needed. On this branch of his subject, however, it may be observed that Bosnian Mohammedanism is not quite the "unique phenomenon" that Mr. Evans seems to consider it. Islâm has made spiritual conquests among the Bulgarians, Albanians, and Greeks almost, if not quite, as extensive as among the Bosnians. So, too, it was perhaps from overlooking the Albanians that he has described the South Slaves as "the most barbarous European member of our Aryan family."

The "Historical Review" further sets the conversion of the Mussulman population of Bosnia to Islâm in a novel and interesting light. He tells us how the Paulician heresy, persecuted by the orthodox Emperors of Byzantium, crossed the Euxine from Armenia to Bulgaria. On the fall of the first Bulgarian Empire—"second" must be a slip of the pen or the printer—the Paulicians, under the Slavonic name of Bogumiles, retreated before their Byzantine persecutors to the parts of Bosnia, whence under the names of Patarenes, Albigenes, &c., they diffused their Manichaean doctrines throughout the West. But the Bogumiles had exchanged the frying-pan of Byzantium for the fire of Rome. From the end of the twelfth century down to the very eve of the Turkish conquest the Popes and other ecclesiastical authorities of the Western Church continually fulminated threats, decrees, and exhortations against the Manichaeans. Whenever circumstances permitted they invoked the aid of the secular arm. The fortunes of the Bogumiles fluctuated with those of Bosnian independence, and the Manichaeans were persecuted or tolerated according as the kings of Hungary succeeded or failed in enforcing their "overlordship," as Mr. Evans delights to call it. Against Bogumile Bosnia, as against Hussite Bohemia, the Magyars served as champions of the Holy See down to the very outbreak of the Reformation. So numerous were the Bogumiles in Bosnia, and so close their connexion with the national feeling of the country, that they baffled the joint efforts of Eastern Orthodoxy and Western Catholicism to exterminate them. At last the tide turned. To avenge the wrongs of the levelling, iconoclastic, puritanical Bogumiles appeared the immense armies of the levelling, iconoclastic, puritanical Moslems. Within a week "seventy cities defended by nature and art" passed into the hands of the Turks. Bobovac, the ancient seat of Bosnian bans and kings, was surrendered by its governor, "a Manichee

who had feigned to be a Christian." A vast number of Bosnians embraced Mohammedanism, and from that time the Bogumiles sink into insignificance as an obscure and scarcely noticed sect. On reading this history it is certainly difficult to avoid coming to Mr. Evans's conclusion, that the great mass of Bosnian converts to Islâm consisted of the long-persecuted Bogumiles, who as Moslems have since repaid to the Orthodox and the Catholics the sufferings inflicted on their forefathers during the Middle Ages. Our author, we are glad to observe, promises to tell us more about the present state of the sect on some future occasion.

Mr. Evans and his brother entered Bosnia at Brood, and struck across country in a somewhat irregular manner; now travelling along the high road, attended by a *zaptieh* forced on them as an escort by the care or suspicion of the Ottoman authorities, now disembarrassed of their guide and guard, they find their way through lonely wooded valleys and still more lonely upland forests to Roman Catholic shrines and Franciscan convents. The difficulties which they encountered in this certainly adventurous tramp were increased by the inaccuracies of the map on which they relied, that of Major Roskiewić. This Austrian officer, however, served them on one occasion so effectually as to redeem some of his cartographical deficiencies. When our tourists presented themselves at the door of the *clausura* of the Franciscan convent of Foinica, accompanied by an "Italian-speaking Effendi," the sight of a Mohammedan official caused the Franciscans to refuse them admission, and even to deny that any curious old Bosnian monuments were to be found in their house. The Englishmen were the more desirous to enter as they knew from the major's book that these Franciscans guarded "the most interesting antiquity, perhaps, in the whole of Bosnia—the book, namely, of the old Christian nobility, as it existed before the conquest." Mr. Evans had luckily copied, and duly coloured, as an appropriate device for the outside of his notebook, the armorial bearings of the old kings of Bosnia, which the major had engraved. On the exhibition of this coloured copy the Franciscans at once changed their behaviour, admitted them into the convent, and even showed them the precious *codex* itself. In the preface we are told that it would not be difficult to mention "routes of greater natural attraction" than the one followed by our tourists. But it would, perhaps, have been difficult to choose a route which, without ever going twice over the same ground, touches on so many places interesting to the historian. It is true that neither Jaicze nor Bobovac was visited, but they could hardly have been included in a tour made during such troublous times. For it is easy to see that the insurrection, which has added an element of interest to the book, often restricted their researches and hastened their steps. But their route led our author to bring out clearly—though we do not remember that he has expressed it in so many words—one of the peculiar features of Bosnian history as distinguished from that of other South Slavonic lands. While Croatia and Dalmatia were altogether Roman Catholic countries,

and Free Serbia, Old Serbia, and the Black Mountain are exclusively Orthodox, Bosnia was a debateable land between the two Churches. Our author might have added this circumstance to his enumeration of the causes that made Bosnia the headquarters of Mediaeval Manichæism. At the gathering at Comušina assembled to celebrate the Feast of the Assumption, he noticed that the metre of some of the popular songs sung to the accompaniment of the *ghuzla* was that of the Anacreontics *Θέλω λέγειν Ἀρπιδας*. He was perhaps not aware that the Slovene poet, Vodnik, made a very close translation of several of these same Anacreontics, in which the metre of the original is reproduced almost word for word. In his remarks on the worship of the Roman Catholic *rayahs* he somewhat exaggerates the "impress of Mahometanism on Bosnian Christianity." In a country so distant from Bosnia as is Brittany, a country in which, save for the hurried visit of some Barbary corsair, no Mohammedan ever set foot, are to be found the same pilgrimages to foreign and local shrines; there the Celtic, like the Slavonic worshipper, executes "certain mystic passes connected with his religion," kisses the floor of the church, and stumps round the building on his knees.

Mr. Evans's tour through the two insurgent provinces of Turkey had, so to say, a preface and an epilogue of travel. The preface consisted of short trips in Croatia, made while waiting for their grand talisman, a *bujurullu*, or passport in the Vali Pashà's own handwriting. The delay was turned to good account. To it we owe a very interesting description of the "house-communions" of the late Military Frontier. "To cross the Military Frontier," we are told, "is to wander beyond the twilight of history, and take a lantern, as it were, into the night of time." In his description of the Croatian costume we are referred to M. Brachet's derivation of the word "cravate." Mr. Evans might have added that the author of the *Dictionnaire étymologique* is clearly in the wrong when he cites (see article *corvée*) "cravate" as an instance of the tendency of the French language to insert a *v* between two vowels. The fact is that "cravate" is the original form of the word, as shown by the native name *Hrvat*, and the German *Krabatte* or *Krawatte*. The epilogue of their tour consisted of their journey from Metkovich, where they re-entered Austro-Hungarian territory, to Ragusa. Descriptions of this most interesting city and of the country around it, serve to close the book with an artistic abruptness worthy of an ode of Horace. The last paragraph may be quoted as a fair specimen of Mr. Evans's style.

"Here at last, after groping among the primeval shadows of the mighty beech and pine-woods of the Bosnian midlands, we take our ease in one of the gorgeous rock-girt coves which beautify the environs of Ragusa. Overhead are hanging groves and gardens of rosy oleander, ferny palms, myrtles, and creepers with flame-coloured trumpets. On the steep, a spiry slope leans forward, stretching towards the south; beneath us the cliffs sink precipitously into the blue-emerald waters—intensified in the deeper pools into a vinous purple—stretching away to the horizon in marvellous ultramarine—on either side

of the cove, fretting in a silvery line of foam against walls of orange rock whose natural brilliance is glorified now into refined gold by the setting sun. This is not the light of common day!—it stands to it as some gorgeous mediaeval blazoning to a modern chromo-lithograph. It dazzles our dull northern eyes. We are on the borders of another world. We catch an inspiration of the South. The waters of the next seabosom lap the ruins of Hellenic Epidaurus.

"But the gold on the rocks melts into more sombre browns and greys; the western steep of the cove lose their outlines in vague shadow; the intense azure of sea and sky dies into a dark sapphire; the plashing of the waves below asserts itself in tones more solemn with the gathering twilight, and the darkness deepens into night."

One or two objections may be made to his "Key to the Pronunciation of the Serbo-Croatian Orthography." As it is intended to be used by English readers, *ts* should be substituted for *tz*, and English *j* for the cumbrous *dsch*. The *é* should be explained as approximately *ty* and *é* as "English *ch*." Nor is Mr. Evans always consistent in his orthography. Why does he retain the Polish spelling "Czech" and the anomalous "Jellachitj"? Nor can the present writer reconcile himself to the *c* in "Slaves," a harsh unnecessary intruder of German origin. Surely "Slavs" would meet all difficulties, and is already frequently found in English print. On p. 261 "Slavonic" is evidently a slip for "Slavonian." On p. 44 Mr. Evans is perhaps the first author that has called the Free Serbians "Franks."

ARTHUR J. PATTERSON.

Shakespeare Hermeneutics; or, The Still Lion. By C. M. Ingleby, LL.D. (London: Trübner & Co., 1875.)

THIS essay, originally printed in the *Shakespeare Jahrbuch*, 1867, and subsequently enlarged for an edition presented by the author to the New Shakspeare Society, is now once more enlarged and for the first time published in England. The quaint second title, "The Still Lion"—suggested by a passage of De Quincey referring to the text of Milton—is significant of the danger of Shaksperian emendation; Shakspeare is the Still Lion, not dead, as the critics by whom he is tugged and touzled suppose, but only sleeping, or shamming sleep; and it may happen that he will start up suddenly and avenge himself upon his adversaries. The object of the essay is to prove, not that conjectural criticism is illegitimate, but that it should be attempted only by a critic duly qualified by gifts of nature and acquisitions of knowledge, and by him in those cases alone where it is absolutely required. If a critic be unacquainted with Elizabethan phraseology and grammar, as Jackson and Becket and many others were; if he be deficient in delicacy of ear for the rhythm of verse and prose, as were Malone and, in a less degree, Staunton; if he be lacking in reverence for Shakspeare's genius, as were Steevens and Warburton, he cannot be looked on as competent to undertake the emendation of Shakspeare's text. Dr. Ingleby proposes provisionally three *canons of emendation*, "which severally deal with the three salient features of conjectural criticism—viz., the supposed *crux* itself; the proposed *method*

of emending it; and the particular *matter* which is designed to supplant it":—

"1. The mere fact of the construction, or a word or words occurring in it, appearing strange, obscure or awkward, shall not alone constitute a reason for treating the passage as if it were corrupt.

"2. The correction of the text shall be attempted upon certain simple hypotheses, framed to account for the supposed misprint, before the adoption of a more sweeping or more violent proceeding; regard being had to the leading or central notion involved in the suspected passage, taken together with its context, and to the phonetic current of the words.

"3. The candidate for admission into the text shall be a legitimate word, known to be in use at the relative time, and otherwise meeting the requirements of the passage, whether as to the leading or central notion, the grammatical construction, or the phonetic syzygy."

These are useful at least as cautions, if not always applicable as canons. Dr. Ingleby is himself unhappy in a proposed emendation, which he adds to fifteen by other critics cited "with unqualified satisfaction." In *Antony and Cleopatra* (v. 2) the fallen Queen exclaims:—

"Or I shall shew the cinders of my spirits
Through ashes of my chance."

Dr. Ingleby reads *glance*. But Cleopatra's eyes are still royal: and were they faded, she would not care to inform Seleucus or Caesar of the fact. The *Still Lion* lays a regal, but affectionate, paw on the rash hand of his critic; "ashes of my chance" is not nonsense, any more than is "the wounded chance of Antony" in the same play (iii. 10); and the contrast between Cleopatra's still glowing spirit, and the burnt-out, gray dust of her fortune could ill be lost in this passage.

Dr. Ingleby's conservative criticism, his maintenance of the original text in various difficult passages, is highly ingenious, and in not a few instances is decisively successful. Even the reader who is not a special student of the text of Shakspeare cannot fail to enjoy the keen and swift coursing of the critic's intellect after truth, which doubles but does not escape. When the famous greyhound, Master Magrath, was anatomised it was ascertained that the extraordinarily swift action of the limbs was due to the enormous relative size of the heart. In like manner it is often the inner imagination which quickens and sustains action that outwardly appears to us wholly intellectual; the imagination is the blood-propelling organ. And thus it is with Dr. Ingleby.

A chapter might well have been added on "Hygiene of the textual critic." Each occupation has its special diseases—the maker of our mirrors suffering in one way, and the maker of our needles in another. Everyone must be aware of a distemper of vision to which the textual critic is peculiarly liable; from intense gazing at a single passage the mental eye becomes disordered and untrustworthy. There are certain geometrical arrangements of lines which, as we stare at them, seem to form now a concave, and now a convex, image. In a similar way a textual *crux* plays tricks with the eye that has stared upon it too long. It is thus that we must account for the extraordinary follies in the way of textual criticism perpetrated by very clever men. The mental

eye became affected somewhat as Turner's sense of sight is alleged by an eminent oculist to have been. And besides this, there are certain diseases constitutional rather than local, to which the verbal critic is exposed. Someone of the craft should study the pathology of his peculiar guild and mystery. And it would be satisfactory to know the means by which W. Sidney Walker, and Dr. Ingleby himself, were enabled to keep their faculties all in good form, and in a state of mutually quickening activity.

The reader of *The Still Lion* in its earlier shape may be directed to the added passages on "brakes of ice" (*Measure for Measure*, ii. 1), p. 145; "rounded with a sleep," p. 138; "tickle o' the sere," p. 71; and—if the reader be not qualmish on disagreeable matters—"keep my stables," pp. 76–79; finally, the parallel from St. Augustine to Hamlet's "if the sun breed maggots in a dead dog," &c., p. 159. It is perhaps worth noting that Tschischwitz, in his *Shakspeare's Hamlet* (p. 119), finds a resemblance between this, among many other passages of Shakspeare's play, and certain portions of the philosophy of Giordano Bruno.

EDWARD DOWDEN.

Artillery Retrospect of the Last Great War, 1870, with its Lessons for Canadians. By Lieut.-Colonel T. Bland Strange, Dominion Inspector of Artillery. (Quebec: printed by Middleton & Dawson, at the "Gazette" General Printing Establishment.)

COLONEL STRANGE has done well to publish his two lectures delivered before the Literary and Historical Society of Quebec. They were originally intended to point out, for the benefit of the Canadian Militia, the lessons to be learnt from the Franco-Prussian war, but they may be studied with advantage by all soldiers.

The first lecture was devoted to Field, the second to Siege, Artillery. Referring to the assertion of the Emperor Napoleon, that the disaster at Sedan was due to the preponderating influence of the German field artillery, Colonel Strange shows that such was not altogether the case. He considers, and most thoughtful people will agree with him, that it was the whole military system of France, and the want of skill on the part of general and staff officers, which caused the collapse of the army. That question has, however, been thoroughly discussed by a score of able writers, and we need not therefore do more than allude to it. At Weissenburg the French were outnumbered in all arms, and had but three light field batteries and one of mitrailleurs to oppose about four times that number of German batteries. It is interesting to note that, according to the German official account, "the mitrailleurs only fired a few rounds, and were easily silenced by the Prussian guns." At Wörth "the French position was salient, almost semicircular; thus offering to the Prussians the opportunity ever coveted by artillerymen—viz., the chance of enfilading both wings from a position nearly opposite the centre." This opportunity was not allowed to slip, and

towards the close of the fight fourteen German batteries—i.e. eighty-four guns—were massed, and enfiladed MacMahon's right wing with terrible effect. Regarding the battle of Forbach, Colonel Strange observes, "The leading artillery features of the battle are the rapid bringing-up and concentration of guns." He also draws attention to the following important assertion:—

"It is said that the Prussian guns, after advancing over the plain, produced little impression, firing uphill on the French infantry extended on the ridge, from the fact that the shells, fired with percussion fuzes, either buried themselves on the face of the abrupt slope or flew harmless over the heads of the defenders."

Had time-fuzes been used, some, at all events, of the shells which did not bury themselves in the hillside would have been effective. At Mars la Tour the German artillery, rapidly massed on the enemy's flank, succeeded, with the aid of the cavalry, in holding him fast till the infantry could arrive. Had not the German field batteries possessed great mobility, this feat could not have been accomplished, and their mobility was "principally due to their system of carrying sufficient men on limbers and gun axle-seats." The French, on the contrary, carried some of their men on the waggons, and obliged the rest to walk. We have done well to copy the Germans in this particular. At Gravelotte the guns of the Prussian right—eighty-four in number—in the most daring manner, and accompanied only by hussar escorts, galloped up a lane which, passing through a ravine, enabled them to escape observation till they reached the plateau.

"The three leading batteries were met by the fire of four mitrailleuses; but, concentrating their whole fire on the nearest, there remained nothing but wreck after a single round. The second and third were treated to a similar dose of concentration, and the fourth retired precipitately to avoid annihilation."

On other occasions, when not so over-matched, the mitrailleuses did great execution and established a great dread among the Germans. We are inclined to think that we are rather hasty in undervaluing them. Speaking of the concentration of fire of the above-mentioned guns, which produced telling results, Colonel Strange justly remarks that it should be inculcated and practised in peace. There seems, however, to be great repugnance to massing guns among our artillery officers, whose motto is concentration of fire, dispersion of pieces. The reason is obvious. When batteries are massed, the battery commanders lose that independence which they are always endeavouring, by hook or by crook, to obtain, and come under the direction of a superior officer. The Prussians, who have had far more practical experience than our own artillery officers, consider this control by a colonel or general an advantage as insuring unity of purpose, and we are happy to see that even some of our gunners show symptoms of becoming converts to these views.

In comparing the French and German artillery, Colonel Strange treats the question from a scientific, a technical, and a tactical point of view. The French, he thinks, devoted too much time to pure mathematics, to the exclusion of practical artillery

knowledge. The Germans avoided this error. We are not sure that we are not somewhat in danger of falling into it. We cannot follow the author closely in dealing with the subject from a technical and tactical point of view. We note, however, a fear which he expresses lest the British sixteen-pounder, though a more powerful gun than the Prussian six-pounder, would be heavily handicapped, because the weight of the shell being great, very few rounds can be brought into action. Some of our readers, by the way, may not be aware that "we speak of the gun by the actual weight of the elongated projectile it throws, while foreign artilleryists designate the rifled piece by the weight of spherical projectile fitting the bore." In comparing the French and German artillerymen, Colonel Strange gives it as his opinion that the former were not educated up to their weapon. With regard to the tactical point of view, we may mention that the author again draws attention to the superior mobility of the German batteries. He also defines in a remarkably clear way the respective functions of divisional and corps artillery. The first is used for supporting the infantry or cavalry division, paving the way for its advance or covering its retreat. The corps artillery should be used for "acting and striking *en masse* the key of a position in obedience to the will of a master hand."

The second lecture is devoted to sieges, and the subject is attractively treated, Colonel Strange giving a very interesting sketch of sieges from the earliest ages down to the present time. For the archaeological portion of the sketch, however, we must refer our readers to the book itself.

There was a general impression abroad in 1871 that the day of fortresses had passed, but, as Colonel Strange says, the Germans have practically shown what their own opinion on the subject is. No sooner was the war over than they set vigorously to work to strengthen and increase the fortifications of Metz and Strassburg. It is not that fortresses have ceased to be useful, but that they must be fortified in a new manner, the town itself being merely the *réduit* of a large fortified camp. It is, however, certain that the old engineer saying, "small work, bad work," is more than ever true, and that a fortress, to be useful, must be situated on a great strategical line of approach.

The chief feature of the German siege of Paris was that it was a combination of a blockade, a bombardment, and partial breaching operations. The first was successful; the two latter produced but insignificant effects. As to details, it is to be noted that

"There were no regular parallels or approaches of attack. Circumstances of ground generally decided the position of each battery, rather than the old rules for placing batteries especially to enfilade, counterbatter, or breach. There were no batteries resembling the old breaching batteries. The great accuracy, range, and power of rifled guns enables, for the old close direct fire, a curved fire, which may be carried on from enormous distances.

"The besiegers generally chose for the sites of their batteries the reverse slope of high ground, so that not only were the guns protected by a natural parapet of great thickness, but there was

no command or made earth to attract the attention of the enemy's gunners. Whenever available, the batteries were built a little distance within woods and orchards, which concealed their construction and armament. At the desired moment the trees in the line of fire were half cut through; the first discharge blew them down, and such as did not impede fire were left on the ground as abattis."

When it was necessary to construct batteries in the open, a sham battery or screen was thrown up about fifty or sixty yards in front. Even snow screens were on some occasions used, "and blank cartridges exploded in these sham embrasures." As to real embrasures they were almost entirely discarded, the Prussians having "an iron bracket bolted on to the ordinary travelling carriage, which raised the trunnions at least six feet above the ground."

It is to the credit of the French that during the second siege they made a much more effective breach than that accomplished by the Prussians on Fort Issy, yet the weapons of the French were very inferior to those of the latter. The defence of Belfort redounded greatly to the credit of Colonel Duport, of the French Engineers. He combined the offensive with the defensive, and, had his garrison consisted of better troops, might have been successful. As it was, the German commander had actually determined to abandon the siege, and had ordered a portion of the investing force to withdraw, when the place surrendered to a staff officer who audaciously proposed terms which the besiegers could not have enforced.

Among the lessons which, as Colonel Strange considers, were taught by the Franco-Prussian war is

"That detached gun-pits on Major Moncrieff's system are the best means of meeting modern attack on an effective and sufficiently economical principle. With great admiration for the sister service of the Royal Engineers, I cannot divest myself of the idea that they inherit not only the talent but the fancy for building on *louis d'ors*, attributed to the French engineers by Louis Quatorze. Laying aside costly iron shields, granite structures, and the ingenious devices for doing away with the destructive effects of recoil, Moncrieff simply trusts to the broad bosom of mother-earth, digs a hole for his gun, and chains the destructive giant of recoil, an obedient slave, to his gun-wheels."

It is impossible to explain more clearly the merits of the Moncrieff system, and it is satisfactory to know that not only a distinguished artillery officer like Colonel Strange, but also our most eminent engineer, Sir Lintorn Simmons, is a warm adherent of the cheap and effective method in question. There is a limit to the thickness and resistance of iron shields, but to the thickness of Moncrieff's parapet there is practically no limit whatever.

W. W. KNOLLYS.

Sketches of the Historical Past of Italy, from the Fall of the Roman Empire to the Earliest Revival of Letters and Arts. By Margaret Albana Mignaty. (London: R. Bentley & Son, 1876.)

It is no doubt very creditable for a lady to have read so much and so thoroughly as has the writer of this volume. But there is a great gulf between the amount of reading which makes a pursuit interesting to one-

self, and the amount of reading which enables one to write what is profitable for others. The pleasure of clearing up one's own ignorance is great, but it does not justify one in undertaking to enlighten mankind. It often happens to those who feel a genuine interest in some subject that they mistake the value of the results of the investigations to which their interest leads them. Those who have never undergone a course of training in any study are apt to exaggerate the importance of their own labours. They think that the trouble which it has taken them to acquire knowledge is a proof that their knowledge ought to be reproduced for the good of mankind. They are anxious to impart what it has cost them such pains to obtain.

Such has been the case with the book before us. The writer has sincerely felt the charm of Italy, and has been led by genuine enthusiasm to investigate the early history of the land. She has learned it with tolerable accuracy and fullness of detail; she has spared no pains to make her view complete, as far as possible. It is very creditable to her that she has gained so much knowledge; but we fail to see that she was justified in writing a book. She has made no fresh discovery; she does not wish to enforce any new view of Italian history; she has no charms of style, or clearness of statement, which might kindle a new enthusiasm in her reader. In fact, there is nothing in this book that might not be found in the pages of Gibbon and Milman, and the reader who has not energy to turn to these authors would not be attracted by the hard, stiff, and pedantic style of Miss Mignaty.

We are not quite clear what object the writer had in view in this book, nor does her own explanation of it help us: "It is our aim to unite the scattered and broken links of the great chain of circumstances which brought on that change in society we call 'our own.'" But if we lay aside the doubts and difficulties which are caused by an occasional introduction of philosophical and semi-philosophical language, we do not find in the book anything except a scattered narrative of some of the chief events in Italian history up to the time of Dante. The points which are chosen for special emphasis seem to have been taken at random. They flow rather from the nature of the author's discursive reading than from any conception of historical perspective. We cannot say whether she means to treat of the growth of European civilisation, of ecclesiastical history, or of the development of Italian politics and thought. The difficulty in writing the early history of Italy consists in the disentangling of these separate elements. As the seat of the Empire Italy was the centre of the history of Europe; as the seat of the Papacy she was the centre of the history of Latin Christianity. But besides these, though influenced by them, there was going on the growth of Italian character, Italian thought, and Italian political life. The consideration of these last elements is often forgotten in the broader questions and more dramatic scenes which gather round the first two points. It is a work worth doing to detach them from the general con-

flict of European events, to trace their growth in separate centres, and sketch their mutual action. But this Miss Mignaty has not attempted to do. The greater part of her book is concerned with the oft-repeated tale of the struggle between the Empire and the Papacy, of which she scarcely has a just conception or an adequate knowledge. For her account of Hildebrand the sole authority to whom she refers is Sir James Stephen's *Essays in Ecclesiastical Biography*.

On the general question of her references we are much perplexed. Sometimes she refers generally to a well-known book in support of an obvious remark. Sometimes she gives minute references to the documents in Muratori and Boehmer. We are doubtful as to her knowledge of German. She refers to "Friedländer, *Mœurs Romaines*," as though he were a French author; and to "Gervinus, *Introduction to the History of the Nineteenth Century*," as though he were an Englishman. The one German reference that we notice does not reassure us; it is to "Gregorovius, *Geschichte der Stadt Rom*." Similarly we are doubtful about the results of a study of Latin Chronicles which leaves in the text of the work such forms as "Municipiae" (which is frequently repeated), "Alpae Cottiae," "Senatus-consulto Aspromano."

The style and philosophic method of Miss Mignaty may be judged by the following extract:—

"There is a natural analogy between man and nature, which brings his instincts and sentiments into harmony with the outward bearings and circumstances in which he stands, and seems to shape his purposes, his aspirations, and his acquirements, in accordance with the surrounding landscape, sky, and objects of existence, forming, as it were, the living atmosphere in which he dwells. That exalted perfection of abstract beauty which is known as the 'Ideal' is simply the expression of the highest order of art; reproducing, in its purest and least material form, the choicest order of created beings."

M. CREIGHTON.

Fiabe, novelle e racconti popolari siciliani: raccolti ed illustrati da Giuseppe Pitre. 4 vol. (Palermo: L. Pedone Lauriel, 1875.)

DR. PITRE, as our readers are doubtless aware (see ACADEMY, December 1, 1873), has long been engaged in collecting and comparing the Popular Tales of Sicily, and the fruits of his industry have lately been given to the world in the four substantial volumes now before us. They contain no less than 400 stories, 300 of which are given in full, preceded by an excellent "discorso preliminare" of more than a hundred pages on Popular Tales in general, and those of Sicily in particular, a valuable *Grammatica del dialetto e delle parlate siciliane*, and a Glossary which most foreign readers will find invaluable. Of the pains he has taken, and the judgment he has shown, in collecting, testing, and annotating the stories, it would be difficult to speak too highly. Many of his notes are thoroughly exhaustive as regards the field of Italian folk-tales to which he, for the most part, confines his remarks, referring to Dr. Reinhold Köhler for cosmopolitan parallels. In these notes

we find, in a small space, a most convenient summary of the information that has been contributed on the various subjects in question by such Italian collectors and critics as Comparetti, Imbriani, Teza, Coronedi-Berti, De Gubernatis, and others, or by the collections of Italian folk-tales published in English by Miss Busk or in German by Widter, Wolf, Knust, Schneller, and, above all, by Signora Laura Gonzenbach (now La Racine). The existence of that lady's *Sicilianische Märchen* (see ACADEMY, April 9, 1870) forms the only obstacle to the complete success, out of Italy, of Dr. Pitre's undertaking. But every possessor of that admirable collection, so excellently annotated by Dr. Köhler, ought to place Dr. Pitre's by its side. The Sicilian tales may be more generally intelligible to Transalpine readers in the German translation than in their original form, but they are infinitely more charming when they are allowed to express themselves in their native tongue. With the help of Dr. Pitre's Glossary, any difficulties which their language may at first offer will soon be overcome, and the toil will be amply repaid by the pleasure of listening, as Dr. Pitre remarks, to the real voices of the Sicilian people instead of to their echoes from the region of an alien and unsympathetic form of speech. To the purely scientific researches of mere story-comparers the question of language is not of the highest importance, but such students will be the first to welcome Dr. Pitre's rich store of tales, and the copious lists he has given of Italian parallels.

Dr. Pitre looks forward to the appearance of new collections of Italian *fiabe*. Lombardy and Piedmont, he remarks, are "terre appena sfiorate," while Sardinia, Corsica, and the Calabrias, are "sconosciute affatto." But for the Sicilian folk-tale enough, it seems to us, has now been done. The subject has been exhausted by the labours of Signora Gonzenbach and Dr. Pitre. So diligently, indeed, was the ground explored by the former that the latter has not been able to add much to our knowledge, so far as the substance of the apparently mythological tales is concerned. Of jocose anecdotes, local traditions, legends of saints, and the like, Dr. Pitre gives many new specimens, but the longer and more dramatic stories, in which a hidden meaning seems to lurk, are nearly identical in the two collections. Neither collection, moreover, has much to offer, so far as plot is concerned, that is novel to readers familiar with Greek, Albanian, and Slavonic popular tales. There were only two of the *Sicilianische Märchen*, to which Dr. Köhler was unable to suggest parallels. Of these two stories Dr. Pitre gives interesting variants.

An analysis of the stories (141 in number) forming the first of the five series into which the present work is divided, that containing the tales devoted "to kings, to enchanted princesses, and to ogres and ogresses," has supplied the following results with regard to their principal themes. What are styled "husk-myths," that is to say, stories of transformations in which a brilliant being, hero or demigod, assumes for a time an obscure or degraded form, out of which he (or she) can generally emerge

at will, lie at the root of the stories forming the largest group. It contains about twenty distinct narratives, besides variants, and includes such tales as *Beauty and the Beast*, *Cinderella*, &c. The group which ranks second in number is that of stories about a brilliant being, generally a princess, carried away by a demon or monster, or enchanted by a wizard or witch. To this group belong fourteen stories, including those about *Sleeping Beauties*. Next in point of number comes the group of stories about a hero who wins the affections of the daughter of a demon or witch, and carries her off in spite of her evil parent's passionate pursuit, which is foiled by the superior sagacity and transforming power of the young lady. At least eight stories make this their leading feature. Of the smaller groups the most popular themes are those of the tricking of a demon or giant or other monster, whose place is sometimes taken in these tales by a robber; the sad story of the Calumniated Wife, generally a queen, who is accused of having given birth to puppies, or the like, instead of princes, and goes through many adventures before her innocence is made clear; the virtues of such well-known Magic Implements as the Seven-leagued Boots, &c.; the lowering of a youngest brother into the Underground World, in which his elder brothers leave him; the fate of Punchkin or "The Giant who had no heart in his body;" the gratitude of assisted animals to man, including the legend of Puss in Boots, and such robber-stories as that of Morgiana and the Forty Thieves. But any results of this kind can be looked upon only as roughly approximative, for so many modern stories are made up of several originally distinct tales that it is difficult, if not impossible, to classify correctly such a collection as that now before us. The other four series into which Dr. Pitre's collection is divided, we may observe, contain jokes, anecdotes, historical traditions, tales founded on proverbs, and fables.

Among the supernatural beings with whom the Sicilian tales make us acquainted, the most interesting are the *Fate*, who answer in so many respects to our fairies, with whom they are by name connected. They figure repeatedly in this collection, generally as benevolent female beings, of brilliant appearance, who confer gifts on mankind. Thus in No. 26 (cf. Gonzenbach No. 30) "tri fati," finding a lad sleeping by the wayside, exclaim—as the anonymous Italian lady may have observed of the sleeping Milton—"Oh chi bellu giuvini stà arripusannu!" and bestow on him a purse, a table-cloth, and a violin, all of magic power. In a Cupid and Psyche story (No. 32) the Sicilian Psyche opens a forbidden chamber (cf. Gonzenbach No. 15), and finds it full of "tanti picciotti fimmini tutti beddi," who are embroidering clothes intended for her coming baby. Seeing her, however, they turn into snakes and lizards (like so many Nāgas) and disappear. In a variant of the Frog-Princess (No. 46), "tri fati" bestow upon a humpbacked princess, who has been obliged, on account of her deformity, to accept a coachman as her husband, three nuts by the aid of which she becomes "the goddess Venus in person," and the street

shines as if with sunlight when she passes by. Sometimes, however, the Sicilian fairies are unkind. Thus in a version of the Substituted Bride story, an angry *fata* dooms a girl to become a black snake when exposed to the sunlight. Her anger arises in this instance from the fact that she loses an eye, owing to a defect in the pie offered to her at the dooming-repast. Some times the *fate* enchant people in a quite unreasonable manner. Thus in (No. 3) the heroine finds her sister imprisoned underground by them. In order to overcome them ten matrons, bearing flowers and incense, are required, as well as eight men strong enough to handle a mace weighing five tons. The *fate* are stupefied by the smell of the flowers and incense, and the eight strong men brain them with the mace.

One of the strangest *fata* stories is No. 67. In it a prince falls in love with a golden-haired maiden, as beautiful as the sun, and is about to marry her, when he discovers that she is dumb. He consoles himself by successively marrying three other ladies, each of whom, in turn, attempts to imitate some wonderful feat performed by the mute, but only succeeds in killing herself. After the decease of her third rival the mute begins to talk, and the prince thereupon marries her. As regards the strange feats which she performs, the story goes on to explain that "she did those things because she was a *fata*." In two variants of this story the mute is one of three puppets with which a prince, seeing them at a window, falls in love. The frequent introduction of puppets, it may be remarked, is one of the characteristic features of Italian folk-tales, the Sicilian included. In one case the *papa*, after the death of the third wife, lets it be known that she will speak to her husband if he says to her, "Thy father is the sun, thy mother the moon." This brings us round to the version of the strange story in the *Sicilianische Märchen*, No. 28. In it the heroine is the daughter of the sun, and she will not marry the hero till he finds out whose child she is. But she will not allow any one who does marry him to survive. In many of the stories of this kind there seems to be great confusion between the *fate* as fairies or other half-divine, half-demoniacal beings, and as the majestic Fates who sway the future. But sometimes we find the fate of an individual mortal personified under the name of his or her *Sorte*. In No. 86 a queen who has had losses is advised to get rid of her unlucky daughter *Sfurtuna*. That unfortunate princess is accordingly turned out of the house. Wherever she goes her Fate follows her, and gets her into terrible trouble, destroying work, letting wine run, and the like, wherever the poor wanderer is hospitably received. At last an employer named Francesca tells her what to do. She takes a present to the "*Sorte di la Gnà Francesca*," and learns from her where her own *Sorte* is to be found. That supernatural being turns out to be a hideous old hag, "*lorda, fitusa, micciusa e smagarata*," who resides in a bakehouse, beside the broom. *Sfurtuna* offers her a cake, saying "*Surticedda mia, pigghiatillu*," but her *Surticedda* will not consent to take it. Eventually, however, the ill-conditioned *Sorte* relents, and *Sfur-*

tuna becomes fortunate. In the similar story, Gonzenbach No. 21, Caterina's *Schicksal* is a tall and beautiful lady with a wheel, whose seven veils prevent her from hearing what Caterina says.

The *Drago* and his terrible wife, the *Mammadraga* (the *Menschenfresser* and *die alte Heze* of the *Sicilianische Märchen*), play a great part in these stories; but there is little to distinguish them from the ogres and ogresses of many other lands. They are closely connected with the Greek *Drakos* and *Drakäna*; and the *Mammadraga* is often represented as almost the exact counterpart of the Russian *Baba Yaga*. Dr. Pitre's collection has but one defect. It possesses no index. It may be of use, therefore, to point out the principal stories in which the *Mammadraga* (*Mamma Draa*, *Mamma-traja*) occurs. In No. 12 she and her two sisters behave kindly to a disconsolate *Psyche*, replacing the three hermits who so often figure in Sicilian tales. In No. 13 she is the demoniacal being whose daughter elopes with the hero. In No. 17 she is the enchantress in a Green Bird story, and also in No. 18, which ends with the well-known spell to prevent childbirth. In No. 63 she plays the part of the witch who confers such different gifts upon girls of different natures. In No. 88 she is the demoniacal being of the Puss in Boots story. In No. 104 she is associated with the Seven-headed Snake which plays so important a part in Slavonic tales. In No. 127 she tries to look like a mere woman, but a man's three daughters successively detect her, observing that she has a long, black, hairy tail, and fly from her. Their father visits her, and she eats him up. In the second of the seven Albanian tales in the fourth volume, a man cuts a cabbage, and along with it what he takes to be a fungus; but it turns out to be the ear of a *Mammadraga*, who is much annoyed. Similarly in Gonzenbach No. 53 a *Heze*, i.e., a *Mammadraga*, hides in a hole, leaving out only one ear, which a neighbour takes for a fungus, and attempts, unsuccessfully, to crop.

Another supernatural being worthy of attention, though she does not often appear, is the Siren of the Sea. In Nos. 59 and 60, both versions of what may be called the Substituted Wife story, the heroine is flung into the sea, where she is hospitably received by "*La Sirena di lu Mari*," but secured by a golden chain, which can only be broken by seven brothers, each wielding a mace or a sword. In No. 102 a poor old fisherman, driven wild by misfortune, cries aloud to his "*furtuna mmaliditta*" to receive him, and flings himself into the sea. Thence he is rescued by a "*pisci russu*," which turns into a golden-haired lady of angelic aspect, who tells him what he is to do in future. After that he cries thrice every morning at daybreak,

"O Sirena di lu mari
Portami pisci rari,"

and catches "*li pisci li cchiù riali e magnifici*." The first two stories occur in the *Sicilianische Märchen*, Nos. 33 and 34. In the third the fisherman's Siren appears to be confounded with his *Sorte*, for it is his own Siren, "*la sò Sirena*," whom he invokes. The *Fata Morgana* (Gonzenbach No. 64)

does not seem to be alluded to in the present collection. But the Cyclopes appear, bearing their ancient name. Besides the Polyphemus story (No. 51 and, in part, No. 103), we find in No. 71 one pear-tree watched by two guardians, "*e avianu un occhiu sulu nni lu frunti, e si chiamavanu Ciclòpi*," and another by "*dudici Ciclòpi*."

We had marked about a dozen stories for detailed notice, as presenting novel or singular features, but we have only space enough left to call attention to No. 88. It is a version of Puss in Boots which has the rare merit of being complete at both ends. That is to say, a motive is supplied at the beginning for the gratitude of the assisting animal, and at the close that animal is treated with ingratitude by the assisted man. In it a fox, caught in the act of stealing pears, is forgiven by their owner. It then, like the booted cat, gains for its benefactor, Don Giuseppe Piru, wealth and a royal bride. But Don Giuseppe eventually ill-treats the fox, which reveals the whole truth to his wife. Whereupon, the storyteller concludes, "ingrate that he was, he killed her (the fox) who had done him so much good." In the similar story *Vom Conte Piro*, Gonzenbach No. 65, no motive is suggested for the fox's kindness.

Before taking leave of Dr. Pitre's excellent work, we should mention that it forms vols. 4-7 of his *Biblioteca delle tradizioni popolari siciliane*, of which the first three volumes are devoted to the popular poetry of Sicily. Forthcoming volumes will contain *Giuochi fanciulleschi*, *Feste dell'anno*, and a collection of "Proverbs, compared with those of the dialects of Italy." In these undertakings he thoroughly deserves the good wishes of all who like to see worthy work well done. W. R. S. RALSTON.

Gray's Inn: Notes illustrative of its History and Antiquities. By W. R. Douthwaite, Librarian. (London: 1876. Privately printed.)

LIKE the man who was struck with the providential arrangement which made big rivers always flow near large towns, many persons must have often blessed the influence which placed our Inns of Court hard by the noisiest thoroughfares. How delightful it is to turn out of the hot and crowded Strand into the cool and quiet courts and gardens of the Temple, though these have lately been much infested with scaffolding poles and wheelbarrows,

"And many a ragamuffin clan
With trowel and with hod."

Gray's Inn has been happily free from alterations for some time. Charles Lamb, indeed, complains that the gardens were spoiled by the erection of Verulam Buildings; but that is long enough ago for most people to have become accustomed to it.

For more than five centuries Gray's Inn has been inhabited by lawyers. When Reginald de Grey of Wilton died in 1370, his Inn in the Manor of Portepoole was let for 100s., and other evidence shows that the lessees were gentlemen and professors of the Common Law. The first Reader mentioned in the Stewards' Accounts, which are now in the Harleian Collection, was

William Skipwith, who was Justice of the Common Pleas in 1359. It is strange that none of the four Inns can claim precedence or superior antiquity, but all stand on an equal footing. We expected to find Mr. Douthwaite claiming the highest antiquity for his own Inn, but he has laudably restrained his imagination from carrying him further than his facts would warrant.

The title of the Society to their land, like that of so many families and corporations, dates from the dissolution of the monasteries. The Priory of Shene had purchased it at the beginning of the century, and on their surrender the king granted it to the Inn at a rent of ten marks, which was paid until 1733. In that year the Society bought the land from the co-heirs of Sir Philip Mathews, who had purchased it soon after the Restoration.

The early records of the Society were destroyed by fire in 1604, so there is not much material for a description of the manners and customs of the Mediaeval lawyer. Some of the orders of Elizabeth's time are still extant, and show an attempt at the maintenance of discipline similar to that in use at colleges. The legal gown must be worn, even in the city or fields, which then were just outside the Inn. Light garments and "the proud practice of wearing boots" are forbidden. No fellow of the Society shall stand with his back to the fire, or make rude noises in the Hall. At this period the sets of chambers were not sufficient to accommodate the members, who had to share rooms or even beds, if an order on the subject is to be construed literally. Worse than this, only Readers were allowed to choose their "bedfellows," and members of lower standing had to put up with any companion the Treasurer might assign to them.

Of the masques and revels, of which mention is so often made in histories of the sixteenth and seventeenth centuries, Mr. Douthwaite has not much to tell us beyond what is to be found in well-known books, except his reference to a pamphlet called "Gesta Grayorum," giving an account of the Christmas festivities in 1594. This seems to have been more a pageant than a masque. It commenced with the enthronement of the Prince of Purpoole, and ended with a fight at the barriers. The revels lasted several days, during which the company had the honour of dining with the Queen at Greenwich, and with the Lord Mayor at Crosby Place. Some thirty years later, the festivities were concluded on Twelfth Night by a successful practical joke. A number of small cannon, which had been borrowed from the Tower, were fired off in the middle of the night. The Court woke in alarm. The king called out "Treason." Perhaps he thought another Gunpowder Plot had come nearer success than the last. He must have been horribly frightened.

The last revel recorded was a very degenerate specimen. It took place on the elevation of Lord Talbot to the Chancellorship in 1773, and consisted merely of a dance round the fire in the Hall while a professional singer, dressed as a barrister, sang the ancient song. Mr. Douthwaite ought to have given us a copy of this, as Prof. Burrows has of the All Souls' Mallard

Song, unless it is one of the *arcana* of the Society.

Though this ancient practice has been discontinued we are glad to find that another and a better one has been revived. We mean the holding of "moots," or formal legal discussions in the Hall, which anciently bore no inconsiderable part in the course of a legal education. Under the present system, the proceedings are conducted as nearly as possible like those of the law courts, so that the student is early familiarised with the practice of his profession. Will the Universities ever revive the public disputations which similarly formed part of their educational course, and the pulpits in the Divinity School at Oxford be again used for their original purpose?

C. T. MARTIN.

NEW NOVELS.

The Rector of St. Judy. By William Soleman. (London: Provost & Co., 1876.)

For Name and Fame. By Mrs. A. B. Church. (London: Tinsley Brothers, 1876.)

Girl Life in Australia. By a Resident. (Liverpool: R. A. Elliott, 1876.)

Griffith's Double. By Mrs. Cashel Hoey. (London: Hurst & Blackett, 1876.)

Betsey Harold's Story. By J. C. (Liverpool: R. A. Elliott, 1876.)

Thereby Hangs a Tale. By G. Manville Fenn. (London: Tinsley Brothers, 1876.)

MR. SOLEMAN'S book is constructed upon rather puzzling lines. To judge from his preface it would seem to have been intended originally as an illustration of the legendary and romantic capabilities of Cornish life. But as a matter of fact it is nothing more than a chronicle of the lives of everybody in one Cornish parish, and of most people in a group of half a dozen Cornish parishes during a period of some forty years. This chronicle is delivered in the most curiously annalistic of styles. The people hardly talk at all, and the narrator talks very little about them, but contents himself with announcing their births and deaths and doings in a succinct fashion, which is odd enough to be amusing for a time. The said doings, it should be mentioned, are not of an edifying order, for, if we may believe Mr. Soleman, the chief pursuits and delights of the inhabitants of St. Judy, St. Frenda, St. Ladon, and the other quaintly-christened "Church-towns" appear to have consisted in drunkenness and uncompromising (or rather compromising) flirtation. There are traces of dry wit about the book, especially in the earlier chapters, which arouse expectations not, alas! to be fulfilled. Some of Mr. Soleman's rustics are very good, or very nearly very good, being quaint with a less outrageous and more possible quaintness than (for instance) Mr. Hardy's pet impossibilities. The best of them is a lunatic farmer, whose Ten Commandments may be worth quoting:—

"First: Thou shalt not take to thyself a wife before the age of forty. Second: Thou shalt not make a fool of thyself before a knowing dog. Third: Never do what another refuses to do. Fourth: Be not wise in another man's eyes. Fifth: Never sow wheat after the tenth of November. Sixth: Plough in the fall if you can at all.

Seventh: Never believe a woman. Eighth: Never follow the fashion. Ninth: Never watch sweethearts in the moonlight. Tenth: Pay as you go."

The book contains, perhaps, the makings of a good book, but is chaotic.

In reading *For Name and Fame* we return to the beaten track. Sylvia Burney was the daughter of a parson with the usual quiver-full of children. Luckily for her, she was very pretty, and had an aunt who was rich and good-natured and took her to Nice. Of her sojourn at Nice and her gaieties there the book is a faithful record, chronicling the dances she danced and the dresses she wore with minute but excusable fidelity. Of course, she has lovers of many nations, but the two favoured ones, Lawrence Ruthven and Captain Arundel, are English. Arundel is a fascinating scamp who has found out (though only partially) certain awkward particulars about Lady Wynyard, Sylvia's aunt. Ruthven also knows these particulars, but will not take advantage (in his case it would be direct advantage) thereof. Ruthven has an honest passion for Sylvia, who returns it; while Arundel—whose game is to marry her, having forced Lady Wynyard to portion her heavily—sows ingenious discord by persuading the young lady that Ruthven is really in love with her aunt. The solution of the difficulty may be left untold, but the reader will, we think, find that it is very tolerably managed. As a whole the book goes trippingly off, and can be recommended. The descriptions of the amusements of Nice are lively, and the conversation is natural. Mrs. Church's writing, if not unfrequently a little slipshod, is fairly correct on the whole—but she is occasionally prone to solecisms of a rather dreadful kind.

Is the Hibernian element in Australia so strong that it has obtained literary utterance? We should imagine so from the fact that *Girl Life in Australia* is an elaborate history of the life of an Australian matron. The principal object of the book appears to be to enable this Resident in the "under-world," as she poetically calls her home, to descend upon the extreme worthlessness and inferiority of everything English. English "thorough gentlemen" stare rudely at their hostesses; make remarks (not complimentary) about "colonial girls" in the presence of the said girls; ensconce themselves behind young ladies when a snake appears; and cannot, even in the literal sense, put their shoulders to a wheel. English servants do not get enough to eat; English carriages are only good to break down; and English people in general are possessed with the unreasonable idea that letters of introduction mean something and are not an idle form. This last complaint recurs so frequently in Australian literature that it seems to point to a real grievance. Yet it appears odd that people should in one breath boast of their limitless hospitality and complain that this hospitality is made use of. We have endeavoured to find out the colonial excellences which make a bright pendant to this dark picture, and we gather from the book that a real Australian matron grumbles when her husband invites guests, says all she can against those guests behind their backs, and boxes

her daughter's ears when the girl offers her well-meant attentions in a great trouble. Here is a sample of the style of this silly book: "For a solitary walk it would have been perfection, but for the girls it must have been rather tedious to look so long (it was half a mile) on the black coat tramping forward and screaming out nothings at the top of their (*sic*) voice." This is not English, and, despite the author's provocation, we are content to believe that it is not Australian. Perhaps it is "underworld."

It is always a comfort to escape from the hands of amateurs and bunglers into those of a practised operator, and this measure of satisfaction at least Mrs. Cashel Hoey affords us. But we do not consider *Griffith's Double* by any means one of its author's happiest efforts. It is true that one arrives at the last page without any very great effort, and without meeting any very great obstacles, but the book does not bear reflection. The plot, though ingenious and cleverly carried out, depends upon a series of coincidences much too complicated to be satisfactory. The characters, if not strikingly unnatural, are distressingly free from any striking touches of nature. The division into six "books," in three of which the author speaks, and in the other three one or other of the characters, is a forced and, moreover, a stale device, which almost deserves the name of trick, and so is the selection of a title which is unintelligible until the last volume is reached, and not very relevant even then. Of course it may be urged that these are objections not likely to trouble the average reader much, and, equally of course, if this argument be allowed there is no more to be said. But it seems a pity that a writer who has few of the faults of the ordinary novelist should fall into errors most of which are easily avoided, and the avoidance of which would certainly not displease any of her readers, while it would undoubtedly please some of them. But *Griffith's Double* is a book which we should not dissuade anyone from reading, and which may be safely recommended to the very large class of people who care only for story without caring or, indeed, knowing anything about character. By the way, why does Mrs. Cashel Hoey take the trouble to call a bedroom a "sleeping apartment"?

It is not in critical human nature to find fault with a novel which extends to only 152 pages, and, moreover, *Betsy Harold's Story* is so exceedingly unpretending and harmless in every respect that it would be a very truculent person who should fall foul of it. It would perhaps have made a more appropriate appearance in one of the quieter religious periodicals, and it certainly is not intended for anyone who wants either art or excitement. But when we have said this we have said our worst.

Mr. Manville Fenn strikes us as being a writer who has not yet "found his way." He writes with fluency and fair correctness, groups his characters with some skill, and bustles them through their journey in a tolerably interesting manner. But he is content with a very commonplace plot, and with terribly conventional characters. His wealthy knight, who emits at every moment a sound which Mr. Fenn vocalises as "Er-

rum," is a very old friend, or rather foe. His baronet and captain are as impossible and as tiresome as if Dickens had drawn them, and his cabman, whether possible or not, is very far indeed from being what he would have been in the hands of Sam Weller's creator. We were sick to death years ago of the pair of sisters, one gentle and meek, the other impulsive and pert, and the naval hero with eight thousand a-year (it is sometimes eight and sometimes twelve) is not only, as Captain Marryat said long ago, "an anomaly," but a clumsy and wooden anomaly as well. Perhaps the most ingenious thing in the book is the device which brings about the catastrophe. Rightful heirs changed in the cradle and restored somehow or other to their inheritance are, we suppose, part of the novelist's legitimate stock-in-trade. But the manner of restitution is *à volonté*. Sometimes we have the *Lady Clare* method, which is, perhaps, the favourite. Sometimes, as in *Ravenshoe*, we find an author daring enough to prove that the feloniously-substituted changeling is, unknown to everybody, the real rightful heir after all. Mr. Fenn's method is delightfully simple and effective. You change two babies, and then somebody else comes and changes them back again—of course without thinking the transaction worthy of notice or mention at the time. This is charming. But does Mr. Fenn when he wishes to entertain his friends with very special champagne give them "dry Clicquot"? If so, perhaps he follows it up with dry Tokay.

GEORGE SAINTSBURY.

CURRENT LITERATURE.

The "Annals" of Tacitus. Translated by A. F. Church and W. J. Brodribb. (Macmillan.) Messrs. Church and Brodribb are to be congratulated on having accomplished an arduous and an honourable if a thankless task. No translation of Tacitus into English is likely to have any recognisable resemblance to the effect of the original, and in wrestling with their author the translators sometimes succeed in being constrained without having attempted to be pregnant or piquant. For instance, II. 41, we read, "how short and how ill-starred had been the attachments of the Roman people," for "breves et infaustos populi Romani amores;" III. 27, "the last specimen of equitable legislation," for "finis acqui juris," and a good deal else of the same kind; but, though it is not possible to get the sort of pleasure in comparing a translation of Tacitus with the original which can be got out of translations of less impossible authors, Messrs. Church and Brodribb have done a service to the English reader by providing him with a terse, scholarly, and readable version. There are a useful introduction and appendices on separate historical points: we may notice especially those on the character of Tiberius, and the financial crisis at Rome in A.D. 33. (It was rather unnecessary in the chronological summary to endorse the theory that that was the year of the Crucifixion.) The printing is careless, *c* being repeatedly substituted for *e*.

Songs of Religion and Life. By J. S. Blackie. (Edmonston and Douglas.) These poems appear to be largely composed of reprints, and have all a "common object"—viz., the cultivation of religious reverence without sectarian dogmatism, and of poetical sentiment, tending not so much to amuse the imagination or to tickle the fancy as to purify the passions and to regulate the conduct of life. "As for the philosophy that lies at the bottom of these poems—and all true poetry is a concrete

philosophy—it is only a modern expression of the nineteenth Psalm, recognising, as that noble composition does, the essential unity and divine significance alike of the physical world without and the moral world within." Prof. Blackie rhymes lightly, and often happily, and has a pure flow of high spirits, one of the best of the good things of this world, and he values his gift and improves it. Times have changed a good deal since Lord Shaftesbury wrote his *Characteristics*: he supposed that he was making a protest against orthodoxy; Prof. Blackie supposes that he is a champion of piety; but the temper in which both "rhapsodise" over nature and life is pretty nearly the same. We notice that Prof. Blackie is proud of the negative side of the historical Christianity of Scotland, while the positive side he thinks is best lost in a general glow of geniality.

Echoes from the Heart; Original and Selected Sacred Poems. Arranged and compiled by Emma C. Moody. (Sampson Low and Co.) As this volume is dedicated by permission to the Dean of Cork, it is significant to find it very colourless doctrinally: one hardly finds anything in it but the common-places of resignation and hope and helpfulness to others.

Brief Biographies of English Radical Leaders. By R. J. Hinton. (New York: G. P. Putnam's Sons.) This forms part of a series edited by T. W. Higginson. The first volume deals with English statesmen, where we suppose Mr. Bright has found a place. The book falls into four divisions, dealing respectively with the Independent Members: Professor Fawcett, Sir Charles Dilke, Peter A. Taylor, Sir John Lubbock, Joseph Cowan, Robert Meek Carter; the Labour Agitation and its friends: Thomas Hughes, A. J. Mundella, Alexander Macdonald, Thomas Brassey, Samuel Morley; Parliamentary Agitators: Samuel Plimsoll, Sir Wilfrid Lawson, Edward Miall, Henry Richards; and Popular Leaders: George Jacob Holyoake, Joseph Arch, Charles Bradlaugh, George Odger, and Joseph Chamberlain. It is difficult to account for the omission of the names of Messrs. Beesly and F. Harrison, for they can hardly have been excluded on theological grounds. There are one or two mistakes, like the conjecture that Sir Charles Dilke's brother is called Austin instead of Ashton; and one or two good stories which are unfamiliar now, like the condemnation of Mr. Holyoake to fines amounting to 600,000*l.* which he requested the Chancellor of the Exchequer to take weekly, not having the money by him. The book appears to be mainly compiled from the *Beehive*, *Men and Manner in Parliament*, the safe personalities of the *Spectator*, and Mr. M. D. Conway's contributions to Transatlantic periodicals.

William Brock, D.D., First Pastor of Bloomsbury Chapel. By George Wilson McCree, Minister of Borough Road Chapel, Southwark. (James Clark and Co.) Hence we may learn that Mr. McCree thinks Dr. Brock a greater man than Havelock, and also that a man who has strong convictions, a clear head, a warm heart, a fine voice, and an iron constitution, must have as satisfactory a life as most successful men as a successful Dissenting preacher. To judge by Mr. McCree's Memoir, Dr. Brock laid less stress than Mr. Spurgeon, for instance, on the distinctive tenets of the Baptist creed, and had sufficient courage and liberality to speak warmly of the late T. T. Lynch, who, without being a heretic, had a mind quite out of tune with Dr. Brock's orthodoxy, or indeed with any orthodoxy.

The Sabbath of the Fields. By the Rev. H. Macmillan. (Macmillan.) This is a very pretty book of sermons; most of them suggest the running-title of Botany Spiritualised. The author moralises on the analogies which human life may be thought to supply to such facts as these—that there is no chlorophyll in flowers; that, in fact, a flower is a faded leaf; that there are barren flowers; and that in Palestine the grass only grows round and under the tall spring flowers, which is the

explanation of the beautiful verse in the Song of Songs, "He feedeth among the lilies."

The Might and Mirth of Literature. By J. W. V. Macbeth. (Sampson Low and Co.) This is a collection of elegant extracts rather fantastically arranged to illustrate the different out-of-the-way turns with which the compiler—an American preacher—thinks other Americans might diversify their sermons. He quotes from himself and other writers of equal merit, but most of the extracts do credit to his reading.

Echoes Re-echoed. By F. P. Cobbe. (Williams and Norgate.) *False Beasts and True.* By F. P. Cobbe. (Ward, Lock, and Tyler.) The first volume of Miss Cobbe's reprints from the *Echo* is often sprightly and almost always kindly, except when the writer is under the influence of *odium Protestantism*. The second contains a good deal of quaint information, genial observation, and shrewd inference.

The Odes of Pindar translated into English Verse. (Winchester: J. Wells; London, Oxford, and Cambridge: Rivingtons.) We have had so many translations of Pindar lately which have been well received that it is quite natural that an ex-schoolmaster, since a country parson, should bring out one more, which has been in his desk seven years. It is not discreditably done, rather in the manner of Heber, and might perhaps have been spared.

The Odes of Horace literally translated in Metre, by Arthur Way, M.A. (Henry S. King and Co.), will probably be interesting to teachers who are engaged in drilling boys in the practice of translation. It is intended to illustrate the theory that an average careful translation rather gains by being forced into a quasi-rhythmical mould: the theory is plausible, like another old theory which is coming up again, that an ungainly girl walks better for a backboard.

The Odyssey of Homer rendered into English Blank Verse. By Mordaunt Barnard, M.A. (Williams and Norgate.) "The object of the translator is twofold; to assist backward students in mastering the original, and to give English readers a simple and unambitious version, often differing little from mere prose." In spite of some inaccuracies, the object of the translator may be said to be achieved.

Half-length Portraits. By Gibson Craig. (Sampson Low and Co.) A series of biographical lectures and sermons, misleading for the most part, because the writer had to be interesting and edifying at all hazards.

Anglican Church Portraits. By J. G. Rogers. (James Clarke and Co.) These sketches are reprinted from the *Congregationalist*, and therefore it is not surprising that the writer is always on the look-out for occasions to disparage the Establishment. It is more noticeable that he treats the very mild heterodoxy of the late Canon Kingsley as an aberration beyond the pale of discussion; what he dreads and resents is Ritualism, and his main charge against Anglican dignitaries is that they cannot put it down, though he speaks respectfully and not unkindly of such leaders as Canons Pusey and Liddon.

The Warfare of Science. By A. D. White, LL.D. (Henry S. King and Co.) Professor Tyndall heard the lecture at New York, and informs us in a prefatory note: "The hue, moral and intellectual, of the words he then uttered remained with me as a memory, causing me to turn with interest to the following discourse, on its appearance in the *Popular Science Monthly*." The President of Cornell University is of opinion that religion has always gained by the victories of *savans* over theologians, and Prof. Tyndall is of opinion that the compassionate condescension which this view inspires will be conciliatory to believers. Dr. White's exposition is rather confused; he mixes up real and imaginary grievances,

and the real grievances are often misconceived. The opposition of the Church to usury was certainly mischievous; but the mischief was not the result of a conflict between revelation and science—it resulted from keeping too long to a rule very useful in a primitive community, where most borrowers borrow because they are in temporary distress, and interest is certain to make the temporary distress permanent. Again, theology had no more to do with the sentimental objection to dissection in the fifteenth century than with the sentimental objection to vivisection now; and the separation between the medical and clerical professions, though effected by ecclesiastical authority, was not dictated by hostility to science. Most alchemists put forward supernatural pretensions and were rogues to boot, though it is likely that if the ecclesiastical police had been less severe we should have had the benefit of electroplate earlier. Alchemy was the most useful science which the orthodox have seriously opposed: really serviceable discoveries, like printing, and the compass, and the circulation of the blood, made their way at once; it is only speculative sciences productive of nothing but barren amazement to the majority incapable of following their processes, like astronomy and geology, whose progress theologians are able to retard or embarrass. Dr. White remarks upon the curious fact that it is only the Protestants who have compromised themselves by opposition to geology, and he gives an instructive, though too combative, account of the apologies that Catholics have put forward to excuse the discreditable case of Galileo. He hardly recognises that Galileo might, perhaps, have escaped censure, if he could have kept to abstract science and cleared his doctrine at any rate of superficial difficulties, which he left unanswered, while his exposition continually took ironical forms, and presented itself as a provocation to theologians and philosophers of the old school, who after all did not think the condemnation which they obtained final. They had forced Galileo to retract, they had got his works and those of Copernicus and Kepler prohibited (but for Galileo Kepler might have escaped censure, as Copernicus had done for many years), but they had not got an *ex cathedra* Papal decision that the sun turns round the earth, for they pressed for it. Dr. White produces no evidence to support his belief that it was ever a sin to question the fantastic cosmography of Indicopleustes. The general decline of knowledge gave it vogue for a time, but the geography of Ptolemy was always as orthodox as his astronomy. The objection to the recognition of antipodes, which faded away at once when the great voyages of discovery began, was not an objection to admitting that the earth was round but to admitting that the unity of the human race was questionable. Most who believed or disbelieved in antipodes before they were discovered agreed that the torrid zone was uninhabitable. As might be expected, Dr. White contrasts Arab science with Mediaeval ignorance, and no doubt the contrast has a meaning; still it is to be remembered that in the thirteenth century science, as it then existed, was crushed out of Islam by Mussulman orthodoxy, and annexed to Christianity by Dominican orthodoxy.

To the Desert and Back; or, Travels in Spain, the Barbary States, Italy, &c., in 1875-6. By Zouch H. Turton. (Tinsley Brothers.) This is one of the silliest and emptiest books of travel that it has been our lot to read for a long time. Its inanity, too, is almost equalled by the bad taste of some portions of it. The attempts at wit are unworthy of a schoolboy in his teens. This is a harsh judgment, we know, but we can write nothing less with justice. Take simply the first specimen of the wit on p. 5 as a sample of the rest. The author and his brother are starting from Le Mans. "When we had taken our seats in the train, the engine whistled the hoarsest whistle I have ever heard. Poor thing! It seemed to be suffering from bronchitis; and we felt that

it was quite a shame to work it, instead of sending it to the engine-house. My brother suggested, 'Perhaps it was only shamming.'" The writer proclaims himself a Ritualist, and seems to consider Church ornament and architecture generally to be his strong point. We give three descriptions of different styles of architecture. Of the choir of the Cathedral of Palencia he writes, p. 23, "the *coro* is the most effectual manner yet invented of rendering a church thoroughly useless. It completely blocks up the view of the high-altar from the greater part of the building; and has been unhappily somewhat imitated in England, as in the case of Westminster Abbey and some of the other cathedrals which have not yet undergone restoration." Again, p. 63, "the Alcazar [of Seville] . . . is in the Alhambra style, although rather inferior, and consists of a beautiful *patio* and rooms whose walls and ceilings are quite works of art. Anyone wishing to get a good idea of these buildings, and not caring to travel quite so far as Seville or Granada, has only to visit the Alhambra Court at the Crystal Palace and imagine a number of additional rooms." Now, for Paestum, p. 258: "The wonderful temples of that place are believed to date from before 600 B.C. A picture I saw of one of them reminded me of the Madeleine at Paris. We did not care to drive for fifty miles (twenty-five there and twenty-five back) through a dangerous, or *quasi*-dangerous, country, in order to be gratified with the sight of three ruins." Is it not almost an insult to his readers to print such stuff? But there are still graver offences against good taste. The Archbishop of Granada is described celebrating High Mass. "Again the Archbishop, striking his breast, expressed his unworthiness to receive the Sacrament (a statement which was, no doubt, perfectly correct);" *sic*. After this we did not feel surprised at reading of St. Louis as: "The individual whom this building commemorates was at one period of his life King of France. He went to fight in the Holy Wars, and, returning from one of those campaigns, thought he would besiege Tunis, and in so doing perished on the spot where his chapel now stands" (p. 227). This last extract is from, perhaps, the best chapter in the book. That one who writes thus should have been an Oxford man, should have resided on the Continent, should be able to boast of a knowledge of foreign languages, and yet should publish such a work for the guidance and instruction of others; truly, this is wonderful!

Villa Gardening. By William Paul, F.L.S., F.R.H.S., Author of the "Rose Garden." Third Edition. (London: Frederick Warne & Co.) A handy manual of gardening by a practical horticulturist needs no trumpet to sound its praises when it has reached its third edition; yet it may be a kindness to some struggling amateur to be told of this "multum in parvo," which deals soundly with the villa garden and all that appertains thereto. He will find that, if he begins from the beginning, he must avoid wind, smoke, and publicity, or of the three evils choose the least, according to his temperament. He will be taught how to accommodate American plants, if not with a peat soil, yet with a soil resembling it in being loose, light, and porous; and how to clothe his wall-space with creepers and climbers, among which is strongly recommended the sweet-scented winter lemon-coloured flower (*Chimonanthus fragrans*) for a south or east wall—to bloom in December. An omission, by the way, among climbers, is *Anaplopsis Veitchii*, which is much more striking than the Virginian Creeper commonly known. On a debatable subject, viz., the sowing the ground beneath a standard rose or rose clump with some thin-growing annual, to prevent a bare look, Mr. Paul gives his voice in favour of the plan; and he also on p. 137 advocates autumnal planting of the beds from which the so-called bedding plants have been removed with dwarf evergreens for a centre, and hardy annuals and spring flowers for surroundings; thus to make sure of eye-service for winter as well as spring.

It is good to have authority for so natural a device. On green-house management, on *stations* for outdoor fruit-trees, on root-pruning (which he considers a doubtful practice), and on wall-copings (he does not notice the valuable new device of "glass copings"), Mr. Paul has numerous practical suggestions: and his copious lists of divers classes of flowers and shrubs will be found most serviceable. Those who have chanced to see two typical gardens on a grand scale—Drummond Castle Gardens, N.B., and Elvaston Castle Gardens, in Derbyshire—will be able to understand Mr. Paul's good taste, when they learn that he infinitely prefers the former to the latter.

NOTES AND NEWS.

THE second volume of Mr. Theodore Martin's *Life of the Prince Consort* is nearly ready, and will be published by Messrs. Smith, Elder and Co. early in October.

MESSRS. MACMILLAN AND Co. will publish among their Christmas Books an original fairy story by Mr. Charles G. Leland, author of *Hans Breitmann's Ballads* and various other works of curious humour and scholarship. The tale, which will bear the name of *Johnnykin and the Goblins*, will be profusely illustrated with quaint and imaginative drawings by the author.

A WORK of considerable interest to musical amateurs, entitled *Musical Myths and Facts*, by Herr Carl Engel, and comprising essays on the art of music, on musical instruments, folk-lore, &c., is now in the press, and will shortly be issued by Messrs. Novello and Co.

SIR HENRY DRYDEN, Bart., has just returned from a visit of some weeks to Gothland, where he has been studying the numerous and very curious churches of the town of Wisby.

THE letter of M. Léonce de Lavergne, the eminent French senator, in the *Economiste Français*, on the decline of the French population, has excited much attention and discussion in France, where his authority, both as an economist and as a statesman, is very great. We have, however, reason to know that M. de Lavergne does not regard the decline as a grave or incurable evil, and that he will, on his return to Versailles after the recess, publish another letter on the subject. We are glad to be able to state that M. de Lavergne's health is better than for a considerable time past.

MISS STOKES is drawing a map of Ireland showing the ancient divisions of the country, and illustrating the wars of the Northmen.

A VOLUME of essays on the wars of the Northmen in Ireland, and other kindred subjects, by the late Charles Haliday, of Dublin, is in the press. Mr. Prendergast has undertaken the office of editor.

MESSRS. MACMILLAN AND Co. will shortly publish two volumes of a new series of popular books on *Art at Home*. The first consists of "A Plea for Art" in the household, with notes on the economy of judicious collecting, by the Rev. W. J. Loftie; and this will be immediately followed by Miss Garrett's "House Decoration," a practical treatise on the subject. Both works will be illustrated with woodcuts.

THE Early English alliterative poem of *The Siege of Jerusalem* will be edited next year for the Early English Text Society by Dr. Moritz Trautmann, of Leipzig, and the Rev. J. R. Lumby, B.D., of Cambridge. There are three MSS. of the poem, of which the Bodleian one is the best. This will accordingly be the text edited, with collations of the London and Cambridge MSS. It is hoped that a different version, in private hands, and which has lost some leaves, may be secured for the Early English Text Society's edition.

PROF. PISCHEL has in the press a new edition of the *Sakuntala*. The text will be based on a

complete collation of all the more important MSS. It will be the first attempt at a critical restoration of the text. The same scholar has advertised an edition of Hemacandra's *Grammar of the Prakrit Dialects*. The text will be given in Roman letters, and there will be notes and a complete index of Prakrit words.

PROF. LEFMANN is going to publish the Sanskrit text of the *Lalita Vistara*, the legendary Life of Buddha. The text of the book published in the *Bibliotheca Indica* is not quite correct, and the last number has never been published.

MR. E. B. DE FONBLANQUE (author of the *Life of General Burgoyne*) will contribute to the forthcoming number of the *New Quarterly* a paper entitled "Caspar Hauser: an unsolved Riddle." The article will contain some hitherto unpublished letters of the sixth Lord Strangford.

THE *Allgemeine Zeitung* announces an interesting discovery made in one of the towers of the Stadtkirche at Weimar. In repairing a wall, an iron box was found containing eight documents, the most ancient of which was of the date 1593. These documents are in perfect preservation, and relate to the invasion of Croatia by the Turks, to the war of the bishopric of Zabern, the price of corn in the year 1620, the defeat of the Calvinists in Electoral Saxony, and to the marriage of Duke John of Saxony with the Princess Mary of Anhalt Altenburg.

MESSRS. MACMILLAN AND Co. will publish early in November a *Text-Book of Physiology* for the use of medical students and others, by Michael Foster, M.D., F.R.S.

THE *Poets Magazine* will in future be published by Mr. Arthur H. Moxon, of 21 Paternoster Row.

DURING the next session of the Philological Society, Mr. W. R. Morfill, of Oxford, will read a paper on the Servian language and literature.

DR. CARL HORSTMANN is editing for the Chaucer Society a simpler and older version of Chaucer's *Prioress's Tale*, no doubt translated from a French manuscript, as the little Christian singing-boy is made a Paris beggar-boy. The English text is one of the only eight (and part of a ninth) now left out of the forty-two "Miracles of the Virgin" once in the grand Vernon MS. at Oxford of about 1375-1400 A.D. The story is very simply told, and varies from Chaucer's in this, among other things, that instead of a grain under the boy's tongue is found a lovely lily-flower, whereon is graven in golden letters *Alma Redemptoris Mater*, the burden of the boy's song that tempted the Jews to kill him.

MR. FURNIVALL's first book for the New Shakspere Society is in the binder's hands. It is William Stafford's examination of the complaint of his countrymen in Shakspere's youth, A.D. 1581, about the dearth (dearth) of things, and other general social troubles; and it contains a good deal of information as to the condition of the country. The chief cause of the rise in prices Stafford holds to be the debasement of the coin by Henry VIII. Mr. Frederic D. Matthew contributes an Introduction on the political economy of the treatise. And Mr. Furnivall has had to dispute the statements of Dr. Farmer (*Essay on the Learning of Shakspere*), and Mr. Greenfield in *Notes and Queries*, that the W. S. who wrote the treatise was the conspirator Stafford, of 1587, the son of Lady Dorothy Stafford. There is no evidence to identify the two men.

WE have received a rather voluminous study on the letter of Sappho to Phaon, by Prof. Domenico Comparetti, which is published by the Royal Institute of Higher Studies at Florence. The author maintains that the letter is really the work of Ovid, and that he used Sappho's writings for those parts of it which do not refer to Phaon or to love; but as he rejects not only the legend (perhaps it should be called the myth) of Phaon, but all the charges against Sappho which have

come down to us from the Middle and New Comedy, he cannot allow that the letter, which presupposes both, has any value for the history of Sappho. The best point is, that the description of her relation to Phaon is utterly vague and in the air. The discussion recommends itself rather by completeness than by originality.

A SECOND edition of Mr. Freeman's *Lectures on the History and Conquests of the Saracens* (Macmillan) has just appeared. Prefixed to it is a new preface containing the author's well-known opinions on Turkish domination.

WE are glad to see that Miss Martineau's *Biographical Sketches* (Macmillan) have reached a fourth edition, and also that the book has been enlarged by four new sketches of Sir John Herschel, Sir Edwin Landseer, Barry Cornwall, and Mrs. Somerville, as well as by a curious autobiographical sketch, all of which are reprinted from the *Daily News*.

IN concluding his account of Edward Hyde, Earl of Clarendon, in the *Contemporary Review*, Mr. Peter Bayne gives us in a few sentences a key to the main difficulties of Clarendon's age. He tells us truly that

"The long Parliament was more Presbyterian than the country; the Restoration Parliament was more High Church than the country. Such is the nature of representative bodies in free States. There is always a risk of their being elected in some paroxysmal mood of feeling, and of their remaining to do work for which the nation represented is not, in its permanent thoughts and feelings, prepared."

Further on he says with equal truth that

"The Civil Wars might have been prevented if there had been a general election at the end of the first session of the Long Parliament; but we cannot add that, if Charles had then dissolved the Parliament, the liberties of England would have been safe." Ought not Mr. Bayne, however, to have been more guarded in putting forward the main argument of his sketch? He holds that Hyde ought with his whole party to have refused to join Charles in the war, and in conjunction with Pym and Hampden to have forced upon him Church reforms which would have prevented the Church revolution which followed. No doubt this would have been the best course to take. But it does not follow that Hyde is to be blamed for not taking it, further than any man is to be blamed for not taking the less dangerous of two alternative courses each of which is full of danger. Mr. Bayne is not sufficiently alive to the enormous danger of the tyrannical predominance of a single house which afflicted men so different as Strafford and Cromwell. Looking back on the past we can see that the danger was less than that of the predominance of the king, but no one can read Clarendon's History without seeing how deep a hold it had upon him; and even without seeing that it was well for the permanent interests of the country that a large party should arise which maintained this view, though it was one which was incapable of useful application at the actual moment. To blame Hyde for not joining Pym and Hampden is something like blaming Vane for not joining Cromwell in expelling the Long Parliament.

VICTOR HUGO now has in the press two new volumes of the *Légende des Siècles*. He has postponed till next spring the publication of his book entitled *L'Art d'être Grand-père*. He will issue at the same time a volume of verse, *Les justes Colères*, a series of satires to form a continuation of *Les Châtiments*.

THE publication is announced of two volumes of Balzac's Correspondence, as well as a third volume of the Letters of M. Doudan.

M. VACQUERIE is about to issue a volume of verse entitled *Faust*. If we may believe the author's friends, it will contain some highly remarkable pieces.

M. P. PARFAIT has just completed a very curious collection of the various superstitions to which modern Catholicism has given rise.

WE have received new editions of Dr. C. M. Davies's *Orthodox and Unorthodox London* (Tinsley Brothers), and of Hawthorne's *Dolliver Romance*, &c., and *Fanshawe*, &c. (Trübner); *Catalogue of Books in the Roxbury Branch Library of the Boston Public Library*, second edition (Boston).

THE following Parliamentary Papers have lately been published:—Reports from H.M. Consuls on the Manufactures, Commerce, &c., of their Districts, Part V. (price 1s. 6d.); Annual Account and Report of the Governors of Queen Anne's Bounty (price 2d.); Report of the Commissioner of Police of the Metropolis for 1875 (price 1s. 1d.); Report of Select Committee on Employers' Liability for Injuries to their Servants (price 11d.); Report of Select Committee on the Metropolitan Fire Brigade (price 10s. 2d.); Twenty-Second Report of the Postmaster-General on the Post Office (price 3d.); Report by Major Majendie on the Explosion of Dynamite at Cymmer (price 1s. 2d.); The Agricultural Statistics of Ireland for 1875 (price 7d.); General Report by Captain Tyler upon Railway Accidents during 1875 (price 1s. 10d.); Annual Statement of the Navigation and Shipping of the United Kingdom for 1875, part I. (price 1s. 2d.); Index to the Report of Committee on Ecclesiastical Dilapidations Acts (price 6d.); Accounts relating to Trade and Navigation of the United Kingdom, August, 1876 (price 6d.); Report of the Meteorological Committee of the Royal Society for 1875 (price 4d.); Index to the Report of Select Committee on Railway Passenger Duty (price 9d.); Return of all Trials of Coal recently made by the Admiralty (price 1s. 8d.); Report of Select Committee on the Telegraph Department of the Post Office, with Minutes of Evidence, &c. (price 3s. 2d.); Report of Select Committee on Local Government and Taxation of Towns, Ireland, with Minutes of Evidence, &c. (price 4s. 8d.).

NOTES OF TRAVEL.

THE Norwegian Atlantic Expedition remained at Reikiavik from July 26 to August 3. While Captain Wille stayed to make magnetical observations on shore, the majority of the members of the expedition made a tour to Thingvall, during which the geological structure of the country attracted much interest. The excursion party returned on July 30. Stormy weather prevailed during the whole stay at Reikiavik, so that the coaling was much delayed, and no magnetical observations could be made. When at last the vessel set out, on the 3rd, the season was so far advanced that the idea of exploring the sea between Iceland and Greenland had to be abandoned, and a course was shaped south of Iceland again, and then towards N.E., running out a line of soundings which showed the transition from the warmer Atlantic water at the bottom to the ice-cold Arctic water east of Iceland. During a dredging on the bank between Iceland and Faroe, on a hard, probably volcanic, bottom, the line got fast on a rock, and it became necessary to break it, a dredge and some hundreds of fathoms of line being lost. (On August 20, 1875, H.M.S. *Valorous*, when sounding, came upon a ridge 400 miles S.E. of Cape Farewell, from which basaltic and other sharp and angular volcanic stones were brought up.) From a point east of Iceland the

course was laid for Namsos (Namsen Fiord, N. Trondhjem), and several deep-sea stations were well explored on this line. The depth at first increased from 1,000 fathoms to 1,500, and then to 1,800, the last being midway between Norway and Iceland, in 64° 15'. The more easterly soundings gave less depth, the least being only 650 fathoms. The temperature at the bottom was always under 32° F.; at 1,800 fathoms it was 29°, corrected for the error of the thermometer and for pressure. The layer with 32° was found in about 200 fathoms, east of Iceland, and in 300 or 400 fathoms, farther east. It seems that the Faroe bank prevents the warm Atlantic water from filling the upper layers of the Northern Seas to such a depth on the north-east side of these islands as it does in the interval between this region and the cold sea east of Iceland. The nearer Norway the warmer is the upper layer of the sea, not only at the surface, but at the depths of 100 to 200 fathoms. The fauna of the Arctic deep sea seems to be very constant, while it is not very rich; similar specimens have been found farther south in ice-cold water, but none of the large forms found in ice-cold water near the coasts were met with. The bottom consists of mud, with innumerable specks of small round calcareous shells. During the last cruise the weather was constantly bad, yet it was found possible to work the deep-sea apparatus even in gales and with a sea in which the ship went bowsprit under, a result obtained after successive experiments. On the last working day the dredge and trawl were sent out together, the latter behind the former; the weather was stormy, the sea very high, but the dredge came well on board. Unhappily, in bad weather the zoologists could not study the specimens found in a living state, the motion of the ship killing the animals very soon. The expedition arrived at Namsos on August 14, the staff and crew being much exhausted by the perpetual bad weather. Magnetical observations were made on shore at Namsos till the 20th. After leaving this place, a series of soundings at every four miles were taken from the Falden-fiord due west. First, a hollow 200 fathoms deep was found, with a constant temperature of 7° C. (45° F.), then a slightly inclined ridge, the highest point of which shoaled up to thirty-six fathoms; then came an incline down to 120-150 fathoms; and after that a flat bottom of the last-named depth. Over this flat the temperature was constantly 45°. At length, on the 21st, the depth increased, the temperature decreased, and ice-cold water was found in somewhat more than 300 fathoms depth. This was 100 nautical miles off the nearest coast, and not very far from the last deep-sea station, where the depth was 580 fathoms and the temperature -1°3 C. (29°7 F.). Such an extent of the Norwegian Banks at this place was not expected, but is very interesting. It now seems probable that the boundary line of the ice-cold water runs from a point 100 miles off the coast at Namsos, up to Spitzbergen outside the Lofoden Islands, and this breadth of the bank explains the mild winter climate which northern Norway enjoys. A series of soundings and temperatures taken next day showed that, in the latitude of the mouth of Trondhjem Fiord and off Romsdal, the boundary of the bank and of the cold water goes much nearer the coast. The water was at 0° C. (32° F.) in 345 fathoms, and at the bottom -1°1 C. (30° F.) in 480 fathoms. On the bank inside there was a temperature of 7°3 C. (45°2 F.) on the bottom at 170 fathoms depth. The results of serial temperatures taken in Romsdal Fiord on the 24th were similar to those obtained in the other deep fiords of the west coast—viz., 6°2 C. (43°2 F.) in the depth of the fiord. On Saturday, August 26, the expedition returned to Bergen, its members being all well and looking forward to the discussion of the observations, which, in spite of bad weather, are numerous and interesting.

REASSURING news has been received from Cairo

of the Italian East African Exploring Expedition. On July 14 two Egyptian staff officers, travelling *incognito* owing to the insecurity of the country, met the Marquis Antinori, the head of the expedition, at Addagalla, on the road between Zeila and Ankober, four days' march from the latter place, which is the capital of Shoa, in Southern Abyssinia. The leader and his companions were in good health. A chief of the Eesa Somali tribe, arriving at Zeila, also reports that he met the Marquis Antinori and his party at two or three days' journey from the Hawash river.

A most interesting paper in the forthcoming number of *Petermann's Mittheilungen*, by J. Kuyper, of the Hague, describes the project of draining the southern half of the Zuyder Zee. This bold scheme, first sketched out by Van Diggelen in 1849, has recently been occupying the serious attention of the Dutch Government, and only a few months have passed since a States Commission gave in a complete report on the possibility and advantages of the undertaking. An accompanying plan shows the proposed dykes and canals, the outermost sea-wall extending from Enkhuisen, in North Holland, across the island of Urk to below the mouth of the Yssel on the eastern shore. The gain of ground enclosed would be not less than 680 square miles, a space equal to ten times that of the Haarlem-Meer, which now supports a population of 12,000. Two other papers, continuing the valuable series bearing on the geography of the Polar regions, give the results of the meteorological observations in Spitzbergen by Wijkander and Koldewey, and a contribution to the knowledge of the winds in Spitzbergen and the surrounding seas by the former observer. Herr Ewald, of Darmstadt, contributes a useful and practical paper urging greater accuracy and more adherence to the native orthography in the spelling of geographical names.

In the *Geographical Magazine* for this month Mr. Ravenstein concludes his laborious search through the array of figures of the British Census Tables, in a clear enunciation of the laws which govern the migrations of the people of the United Kingdom, pointing out finally the deficiencies of information in the tables, and the desirableness of statistics on certain points in future enumerations: such as the distribution of the natives of each county throughout the British Isles; emigration tables, distinguishing the birthplaces of the emigrants; above all, he urges the assimilation of the boundaries of the registration counties to those of the counties proper. Mr. David Ker contributes a timely paper on the Countries of the Turkish Border—Bulgaria, Servia, and Roumania; and the account of Sosnovski's great journey of 1874-75 through China and Mongolia is translated from the *Russian Geographical Journal*. Mr. H. P. Malet's papers on "The Sea-Level," the second of which appears in this number, are intended, if we understand them aright, to put forward a new geological theory of the origin and position of stratified rocks, by a reduction of the sea-level, the deepening of the sea-bed being conceived to be brought about by the action of under-currents wearing away the bed of the ocean. "When this happened, and when there was no material at hand to fill up the place, it follows that the water sank into it under the law of gravitation." Unfortunately, the author takes no account of the material thus worn away: we cannot suppose that it was annihilated, and if removed from one part of the sea-bed it would certainly be deposited in some other portion, leaving the average depth and capacity of the ocean basin the same.

MESSRS. HODDER AND STOUGHTON announce a new story by Mr. J. B. de Liefde, author of *The Beggars*, entitled *The Maid of Stralsund*, a story of the Thirty Years' War; and *The White Cross and Dove of Pearls*, by the authoress of *Selina's Story*.

THIRD SESSION OF THE INTERNATIONAL CONGRESS
OF ORIENTALISTS, ST. PETERSBURG, 1876.

(Second Notice.)

SEPTEMBER 2.—The sittings of the sections are held at the Hôtel de la Ministère de l'Intérieur. In rooms adjoining the hall where these sittings take place, objects of interests relating to the different sections are exhibited. In one of the rooms the principal books, pamphlets, maps, &c., printed in Russia and relating to Asia, are exhibited. The latest surveys, as that of the Oosack part of Orenburg, and of Hissar, are here. In the other rooms there is a collection of implements of the Bronze Age from the shores of Lake Baikal and other parts of Siberia; a collection of Cufic coins from Finland and Lapland, including some rare specimens of the Ommyyad dynasty, brought by Prof. Lagus, of Helsingfors; the altar of a Buriat temple, with a number of Buddhist images; a large tray and several vases of copper engraved, and also fabrics in wool and silk from the Caucasus—(these products of the Caucasus, according to M. Berger, were especially selected to show that the designs, which are often of great beauty, are altogether independent of European culture)—a Kirghis tent lined with carpet and furnished as used by its owner, Sultan Mehram Janidorf, who has himself come to the Congress; a large embroidered carpet, the work of Kirghis women; a curiously-worked djergak, or long Kirghis robe; a Kirghis bride's dress, with a curious tall head-piece; Kirghis, Yakut and Samoyed dresses; and several other objects relating both to the antiquities and present condition of the Oriental subjects of Russia. It is a new and valuable feature in the proceedings of this Congress, that a summary of the communications made each day to the Congress is to be published on the following day, and this, of course, will be of special value as regards communications made in Russian, which few, perhaps, of the foreign members are conversant with.

In Section II. (Middle Asia, &c.)—President, M. Schéfer—M. Tscharykow read an account of a journey undertaken in 1669 by Pazoukhine to Khiva, Bokhara, and Balkh, from papers found in the archives of the Minister for Foreign Affairs at Moscow, which contain very full accounts of the economical and social state of those countries, of the traffic in Russian prisoners organised at Khiva, and of the audiences of Pazoukhine with the Khans. The Rev. J. Long was then invited to read his paper on "The Aryan race, its Origin in Middle Asia, and its Emigration to Europe and India," but as it was in English it was ruled by the president of the section that its reading was prohibited by Art. 16 of the Rules of the First Session, according to which communications were only to be made to the Congress in French, or in the language of the country where the Congress was held. At a later stage in the proceedings the President of the Congress invited the members to reconsider this rule. Some objections were raised about the inconvenience that would arise from possible discourses in Turkic, Mongolic, &c. by the different representatives of the Asiatic races present at the Congress, but it was ultimately decided by a large majority to rescind the Paris rule, and members are to be allowed in future to address the Congress in whatever language they please. Mr. Long was then asked to read his paper, the principal object of which was to urge the necessity of further enquiry. M. Oppert gave an account of two languages, the Susian and the Median, which were neither Aryan nor Turanian, and which he grouped together under the name of Suso-Median. The Suso-Median race ruled in Iran and Khuzistan centuries before the Aryan rule of the Persians. The Median language was found on the second tablet of the Achaemenian inscriptions; the traces of the Susian were found from 2300 to 56 years before Christ. He explained also the differences in the characters and in the grammar

which existed between these two languages. After this the President read the questions relating to Middle Asia which had been prepared by the committee. To some of these questions no replies were forthcoming. To the question whether there was any tribe bearing the name of Mongol before Gengis Khan, or whether it was only a dynastic name adopted by Gengis Khan himself, Mr. H. Howorth replied that there was such a tribe, and that it was mentioned by Chinese historians two centuries before the time of Gengis Khan. To the question as to the meaning of the words Turan and Turanian, when employed by the ancient Persians, and as to the period when the Turanians, in the modern acceptation of the word, occupied that part of Middle Asia to the south of the Tian-Shan, the President of the Congress, M. Grigoriew, who spoke in Russian, replied to the effect that it was only in modern times that the country to the north of the Amu-Darya, which the Persians called Turan, had been occupied by a Turkish race, and this had given rise to the erroneous opinion that Turan was always Turkish, whereas we learn from Chinese sources that its former occupants were a people whom we call Aryan, and this people M. Grigoriew believed to have been the ancestors of the Slavonic and Germanic races. To the question as to by what people the Mawar-al-Nahr was taken from the Samanids in the tenth century, M. Grigoriew also replied that it was clear from Mussulman sources that it was not the Ugurs, as was generally supposed in Europe, but the Karlucs who had conquered the Mawar-al-Nahr. The question concerning the authorship of the *Risalat Abu Dolaf* was also answered by M. Grigoriew, who considered that it could not have been the work of the Arabian poet of that name of the tenth century, but that it had been written by some unknown person who knew very little about the country which formed the subject of his narrative.

In Section III. (Caucasia) the President, M. Gamazow, was prevented from attending by indisposition; his place was taken by one of the vice-presidents, M. Berger. A letter was read from M. Renan expressing his regret that the state of his health prevented him from attending the Congress. Besides an allusion by M. Berger to the productions of Caucasia exhibited in an adjoining room, the only other information given was by M. Grigoriew, to the effect that Caucasian was not a proper term to apply to the fair European race: it led to the erroneous conclusion that the race had its origin in the Caucasus, which certainly was not the case, as it could only have come from Middle Asia. Much disappointment was felt at no more information being forthcoming about the Caucasus—and especially with regard to its languages, about which so little is known—as the Caucasus belongs to Asiatic Russia, and it was to Asiatic Russia principally that the work of the Congress was, according to the committee's plan, to be devoted. The President of the Congress, M. Grigoriew, is, no doubt, indefatigable; he does as much as or more than can be expected of any one man; but several distinguished scholars who owe some allegiance to Russia are conspicuous by their absence. There is not always the right sort of feeling among scholars towards each other. It seems as if that "ocean of unchained passions" of which the President spoke in his inaugural address as raging only in the outer world, and from which Science was to be the asylum, had cast some of its spray across the sacred boundaries of Science itself.

September 3 (Sunday).—The members of the Congress were invited to inspect the Oriental manuscripts at the Imperial Library, which were shown to them by Prof. Kossowicz. They saw the celebrated Koran of Osman in Cufic characters, one of the pages of which is stained with blood, said to be this Khalifah's blood. This Koran was brought from Samarkand by General Kaufmann. They saw also a fine manuscript of

Rashid's *History of the Mongols*; a work which, it is said, is to be published by M. Ménard, of Paris; and several other manuscripts, remarkable for the beauty of the illustrations. After this they were taken to the Hermitage, where they were shown the remarkable collection of Chudic ornaments, made in the time of Catherine II., and other objects of interest for the Congress.

September 4.—In Section VII. (Turkey)—President, S. E. Ahmad Vefyk—M. Harkavy read a note on a passage in Masudi, in which it is stated that the Slaves were formerly united under a king named Majak, of the tribe of the Valinana, a passage about the explanation of which a great deal of trouble had been taken by European scholars. M. Harkavy explained this passage by a reference to the Byzantine authors from whom, at second-hand through Al Khorrami, who had been a long time a prisoner among the Byzantines, Masudi had evidently derived his information. These authors mention the defeat of a slave chief named Musak, evidently Masudi's Majak, by the Byzantines. Masudi's Valinana, again, is probably the modern Wallachia, earlier Vlach. M. Dérenbourg then made some remarks on two ancient works on grammar of great importance, the publication of which had been commenced by him: one was the shorter treatises of Abu-l-walid of Cordova, in Arabic, on Hebrew grammar. With the Dictionary published by Neubauer, and the Grammar by Goldberg, the world would then be in possession of all the works of this distinguished grammarian. The other publication to which he referred was the *Kutab* of Sibawaihi, a grammatical treatise on Arabic grammar of the second century of the Hejira, to which nothing of importance has ever been added. Next, Mr. Howorth presented a treatise "On the Khazars," a people formerly inhabiting the country of the Lower Volga and converts to Judaism, of which he read an abstract in English. The object of the treatise was to prove that the Khazars were by origin Turks, and not, as had at one time been universally supposed, Ugrians. M. de Goeje read in German an account of an Arabic manuscript of Al Yakubi belonging to the Cambridge University, which contains the history of the Abbassides, a work which he considered of very great importance. M. Smirnow read in Russian an account of a Turkish manuscript belonging to the library of the University of St. Petersburg, entitled "The Mythology of the Asiatic Peoples." M. Mourkos read in Russian an account of popular instruction in Syria. The papers being finished, the President read one of the questions proposed by the committee—namely, how far the mutual relations of the Arabic tribes before Mahomet threw any light on the political condition of the Israelite tribes of the time of the Judges. In discussing this question, some difference of opinion was expressed as to the existence of the sentiment of nationality among the Jews at this period. The next question was as to the causes at the commencement of the eleventh century of the entire cessation of the commerce between the Eastern Mahometans and Northern Europe, a commerce which had existed previously without interruption from the seventh to the tenth century. M. Chwolson maintained that it was owing to the overthrow of the kingdom of the Khazars at the end of the tenth century by the Russian Prince Sviatoslaw; and thus the influence of the Khazars, who occupied the Lower Volga, and were favourable to the commerce with the East, was entirely destroyed. This explanation was not, however, satisfactory to M. Grigoriew. In Section V. (Extreme East)—President M. de Rosny—M. Makhov read a paper in Russian on Japanese history and tradition, with reference to one of the committee's questions, and he made the historical period commence from about 600 B.C. M. de Rosny, on the other hand, did not credit the authenticity of Japanese chronology. All the documents of the primitive history of the Japanese had perished, and what they had now

were not authentic; nor did he consider the Japanese as autochthonous, but held them to be a mixture of Chinese, Koreans, and Tatars. M. de Rosny then discoursed on a question proposed by himself—namely, the possibility of reconstructing the Chinese language as spoken at the time of the Han dynasty, and even before that period. He held that it was possible. The Chinese of the present day consists of monosyllables, and of monosyllables composed of a vowel preceded by a consonant, but this was not always so; its roots were formerly like those of the Semitic languages, trilateral, and this was proved by the Chinese words which we find transcribed in Japanese characters, and by the Sanskrit words transcribed in Chinese characters. A patient comparison of these words would enable us to reconstruct the Chinese language of the Han dynasty, and he thought it possible to advance even beyond that period. M. Vassiliev, by invitation of the President, gave an interesting account of the Chinese language, its ideographs, &c., referring to the Japanese being able to read Chinese books, though pronouncing the words in a manner different from the Chinese. M. de Rosny asked the attention of the Congress to the question of the discovery of America by the Chinese before the time of Columbus. This discovery was first attributed to them by De Guignes in the eighteenth century; and Naumann had gone so far as to publish a description of Mexico in the fifth century from alleged Chinese accounts. Klaproth and others, however, had treated it as a fable, but the cause of the Chinese has lately been again advocated in France at the Académie des Inscriptions. The Chinese authors describe a long voyage undertaken to the country of Passang; the distances between the different places visited on the way are given, and these added together make Passang to be not so very far from America; but the error in this conclusion is, as we have documentary evidence to prove, that the value of the *li*, the Chinese measure of distance, has changed; the *li* is much larger now than in former times. A corrected estimate of the *li* brings Passang at all events within the limits of Asia.

September 5 (morning sitting).—In Section VI. (India, Persia, &c.)—President, M. Kern—with reference to the committee's question, whether the Pushtu, or language of the Afghans, was radically connected with the modern languages of India, the Sindhi, and the Panjabi, or with the Persian, M. Terentiev read a paper in Russian, in which he tried to prove that the Pushtu was an entirely independent language, and he held that all the Persian and Modern Indian words found in it were borrowed words. This is a conclusion opposed to that of Trumpp and other scholars. Another question discussed was as follows:—How far can we follow in historic documents the ethnographic names of "Sart" and Tajik? What conclusions have we concerning the primitive signification and successive acceptations of these names? M. Terentiev and two or three other members discussed these questions, but did not seem to come to any satisfactory conclusions. M. Terentiev further referred to an interesting people of Middle Asia called "Kafirs," or infidels, by the Mahometans, but who call themselves "Bolors," and concluded with expressing a wish that some steps might be taken by the Congress for a thorough exploration of the country inhabited by this people. After some remarks by other members it was agreed to refer the matter to the Council. Some conversation then took place as to the best way of representing Oriental words in the European languages, but, as was to be expected, not one speaker agreed with another on the subject. M. Oppert explained the latest etymology of the words "Avesta" and "Zend." These words belong to the ancient Persian language—the language of Darius and of Xerxes. They are not found in the Zendavesta. The word "abasta," which is only another form of "avesta," occurs in the Behistun inscription, where it

means "the law." Darius says: "I have been protected by Ormuzd, for I have walked according to the law." The word "zannda," whence "zend," occurs on the funeral inscription of Darius, and means "prayer." Dr. Macnamara made some remarks on the traces of cholera found in historical documents, which he thought deserved the attention of Orientalists. He presented a treatise on the subject. E. L. BRANDRETH.

CORRESPONDENCE.

CATS IN ANCIENT GREECE.

Dublin: Sept. 11, 1876.

Without venturing to criticise my learned critic, Mr. A. S. Murray, by way of personal justification will you let me inform other classical scholars who agree with him in doubting whether cats were domestic animals among the Greeks that on that point, as elsewhere, I did not make my assertion without evidence? Here it is, from no less a source than Aristophanes:—

Wasps, 362 (Dindorf).—

τὰ δὲ δὴ αὐτῶν ἐπὶ ταῖσι θύραις
 ὡσπερ με γαλῆν κρία κλέψασαν
 τηρούσων ἔχοντ' ὀβελίσκους.

And again:—

Thesmoph. 559—

ὡς τ' αὐτὰ κρέ' ἐξ Ἀπατουρίων τοῖς
 μαστροποῖς διδοῦσαι,
 ἔπειτα τὴν γαλῆν φάμεν.

And these allusions only repeat what Simonides of Amorgos had said long before, when comparing women to various animals, all (save the fox) domestic:—

Frag. 7, 50, sqq. (Bergk).—

τὴν δ' ἐκ γαλῆς κ.τ.λ.
 κλέπτουσα δ' ἔρδει πολλὰ γείτονας κακά,
 ἄθυστα δ' ἱρὰ πολλὰκίς κατεσθίει.

These passages, which have no point in them if the cat was not common in houses, and regarded as a regular inmate, had persuaded me that my statement was correct, though I know there are difficulties connected with the vagueness of the name. But in my *Primer* I thought it right to state, without hesitation, what I believed true, even at the risk of being challenged by specialists.

J. P. MAHAFFY.

THE SITE OF PETHOR.

Queen's College, Oxford: September 10, 1876.

A melancholy interest now attaches to the neighbourhood of Aleppo, the scene at once of Mr. George Smith's last great discovery, and of his untimely death. His settlement of the site of Carchemish, the Hittite capital, at the modern Jerablûs, brings with it a train of consequences. One of these is the determination of the position of Pethor, called Pitru in the Assyrian inscriptions, the city from which Balaam came. Before showing how this is the case, however, it is as well to notice that just as the Jerablûs of the Euphrates represents the Greek Hierapolis, so too the Jerablûs which lies a little to the north of Hamath must represent another Hierapolis, which can be no other than the famous Kadesh, or "holy city," the capital of the Hittites during their early wars with the Egyptians.

According to Samas-Rimmon (B.C. 823-810), the town of Kar-Shalmaneser, "the fortress of Shalmaneser," lay on the eastern side of the Euphrates, in front of Carchemish (literally "as thou comest to Carchemish," *W. A. I.*, i. 30, 9). Shalmaneser, the father of Samas-Rimmon, had given this name to Tel-Barsip, "the stronghold of Akhuni, the son of Adini," his leading Syrian opponent, after his capture of the place. Tel-Barsip is clearly the Βαρσάψη of Ptolemy, the site of which accordingly cannot be that ordinarily assigned to it since the time of Ritter. It was here that Shalmaneser received the tribute and submission of the Hittite and Syrian princes, and sent out a force which captured the town "which the kings of the Hittites call the city of Pethor." The latter is described as lying upon the river 'Sagura, or 'Sagurri, on the western bank of the Euphrates, and facing Mutûnu on the eastern bank of the river. The two cities, Shalmaneser states, had been conquered by Tiglath-Pileser I. (B.C. 1120), but lost again to the Arameans by Assur-rab-buri, and Mutûnu is evidently identical with Mitau, which, like the neighbouring town of Arazika, stood "opposite to the Hittites," and was the locality where Tiglath-Pileser I. killed some wild bulls. While at Pethor, the name of which he changed to "Assur-tamsukha-atsbat," Shalmaneser received the homage of 'Sangar, King of Carchemish, Cundaspi, King of Comagene (whose Iranian name must be noticed), Dipparuda, or Garparunda, King of the Patinians, and other princes, and shortly afterwards marched from it to Aleppo. It is clear from this that Pethor was built upon the river 'Sagura, near its junction with the Euphrates on the western side; it is also clear that it lay southward of Carchemish on the road to Helbon or Aleppo. There is only one river the position of which will agree with that of the 'Sagura, and this river is the one now known as the Sajur. The persistency of local nomenclature in the East is well known, and I may refer by way of illustration to a small place to the west of Aleppo and the Afrin, now called Unk, which preserves the classical name of Onchae, and the still older name of Unki given to it by Tiglath-Pileser II. The Afrin itself, the Ephrenus of classical geography, is the Assyrian Aprie, a river often spoken of in the inscriptions. Pethor may possibly be represented by the modern village of Sajur, though this seems too distant from the Euphrates; at all events, it cannot be the modern Tel-Basher, as this is too far to the north-west. Tel-Basher may, I think, be identified with the land of Bisri on the west bank of the Euphrates, in which lay the six cities captured by Tiglath-Pileser I., after his defeat of the Hittites outside the walls of Carchemish. Bisri appears as Bisuru in the annals of Assurnatsir-pal (B.C. 883-858), who describes it as "a steep mountain towards the sources of the Euphrates" (*W. A. I.*, i. 24, 40). The sources, however, must have been those of some other river than the Euphrates, as the spot was not very far to the north of Circesium and Bales.

A. H. SAYCE.

A TURKISH MAP OF THE WORLD.

London: Sept. 6, 1876.

In the Sala dello Scudo in the Doge's Palace at Venice, among other geographical rarities, there is, as many will remember, a large wooden block engraved with a Turkish map of the world, projected in the form of a heart. This engraved block was executed by one Hajji Mahomed of Tunis in 1550, and was taken, if I remember rightly, on board a Turkish or Tunisian vessel captured by the Venetians. It always seemed to me a singular piece of work for a Turk of the sixteenth century. It would appear, however, that it was not original. For recently, when at Nuremberg, I saw in the German Museum there, Hall No. XXXII., a woodcut map of the world on a similar heart-shaped projection, which bears the subscription:—

"Hierio Gormontius curabat imprimi Lutetiae Parisiorum Anno Christi MDXXXVI."

There is also a rubric which I partially transcribed:—

"Orontius F. Delph. Regius Mathematicarum Interpres Studioso Lectori S. D. P."

"Decimus quintus circiter agitur annus candide Lector quo universarum orbis terrarum designationem in hanc humani cordis effigiem primum redigimus," &c., &c., (dated) "Lutecie Parisiorum Cal. Maij MDXXXIII." H. YULE.

JACOPO DE' BARBARJ AND PETER VISCHER.

Stanmore Hill: Sept. 12, 1876.

I regret that M. Burty by his somewhat broad statement, founded on the assumption of M. Berger, that "the bronze plate (bas-relief) *Orpheus and Eurydice*, belonging to M. Dreyfus, and etched in M. Ephrussi's book, is not the only work modelled and cast by Vischer after the compositions of Jacopo," and by the remark that "Dr. Lübke's observations have no direct connexion with M. Ephrussi's work," should have endeavoured to screen the manifest error into which that able writer had fallen, by ascribing the sculpture in question to Jacopo de' Barbarj.

In February last, while looking over M. Dreyfus' rich collection of Italian bronzes, my attention was arrested by that *rilievo*, on which I at once recognised the manner and the emblem of Peter Vischer. Remarking the interest I took in examining the plaque, M. Dreyfus informed me that it had just been published in the *Gazette des Beaux-Arts*, by M. Ephrussi, who attached great importance to it, as being the work of Jacopo and the only known sculpture by that eminent engraver, whose well-known emblem—the caduceus—he recognised in the upper left corner.

To this assumption I at once objected, pointing out to M. Dreyfus that the emblem represented two fishes impaled upon a spear, and not a caduceus, and that it was undoubtedly a work by Peter Vischer.

Having previously sent photographs of my inkstands to Dr. Lübke, and recollecting the existence of a bas-relief of similar subject at Berlin, I wrote to him upon the subject. The result was his admirable analytical paper which appeared in the *Beilage zur Allgemeinen Zeitung* of May 30.

That the same hand which modelled those bas-reliefs also executed the inkstands in my possession, is beyond doubt; that that hand was Peter Vischer's each and all of them bear their own certificate.

But, alas! *nemo mortalium*, &c., applies to all; none of us are infallible.

M. Ephrussi, mistaking Vischer's impaled fishes for Jacopo's caduceus, was partly blinded by the pleasant haze that frequently envelops a fancied new discovery, and only saw the really remote similarity of Jacopo's figures, magnified into a near affinity with those of the bas-reliefs; but he was wrong.

It had been better that these facts had been acknowledged by M. Burty in his first letter on

the subject, as they had already been by M. Dreyfus long before.

The similarity in composition between Dürer's *Adam and Eve* and Vischer's *Orpheus and Eurydice* is rather one of analogy than affinity, and, although a German sentiment is distinctly manifest in both works, that by Vischer, being a classical subject, is more influenced by the spirit of the Italian Renaissance. But are we then to conclude that either was inspired by Jacopo's etchings? that the Eve and the Eurydice were the offspring of Jacopo's nymph with the mirror? that Adam and Orpheus are related to the *Suppliciis* or to the Apollo?—a conclusion surely less reasonable than to admit the similarity between Dürer's representation of our first parents and Vischer's *Orpheus and Eurydice*.

That all these artists may have drunk deeply at Martin Schongauer's life-giving fountain is a reasonable supposition, but whatever inspiration Dürer and Vischer may have derived from that source, they each maintained their own individual character, and that character is clearly manifested in their various works. Jacopo, on the other hand, drew from many springs, adopting various styles, as is so well illustrated by M. Ephrussi in his interesting and able treatise.

It is not for me to raise the gauntlet thrown down by M. Burty at Mr. Scott's feet.

C. DRURY E. FORTNUM.

SCIENCE.

British Manufacturing Industries, edited by G. Phillips Bevan, F.G.S. *Wool*, by Prof. Archer; *Flax and Linen*, by W. T. Charley, M.P.; *Cotton*, by Isaac Watts; *Silk*, by B. F. Cobb; *Acids and Alkalies*, by Prof. Church; *Oils and Candles*, by W. Mattieu Williams; *Gas and Lighting*, by R. H. Patterson; *Metallic Mining and Collieries*, by Prof. W. Warrington Smyth; *Coal*, by A. Galletly; *Building Stones*, by Prof. Hull; *Explosive Compounds*, by W. Mattieu Williams; *Paper*, by Prof. Archer; *Printing and Bookbinding*, by Joseph Hatton; *Engraving*, by Samuel Davenport; *Photography*, by P. Le Neve Foster; *Toys*, by G. C. Bartley; *Ship-Building*, by Capt. Bedford Pim; *Telegraphy*, by Robert Sabine; *Agricultural Machinery*, by Prof. Wrightson; *Railways and Tramways*, by D. Kinnear Clark; *Tobacco*, by John Dunning; *Hides and Leather*, by J. Collins; *Fibre and Cordage*, by P. L. Simmons. (London: Edward Stanford, 1875-6.)

THESE volumes of the "British Industry Series" occupy an intermediate place between works of a detailed technical character, which few persons not actually engaged in the occupations described would be likely to read, and what are usually offered as popular books, which are too flimsy to be of real use. They are illustrated with wood-engravings when necessary, and the names of the writers are sufficient warrant that they are carefully compiled.

The writer on "Silk" tells us that this valuable article might easily be produced in much greater quantities. He says land suitable for mulberry trees is far more plentiful than that suited for cotton; that an acre of land will grow 500 trees, yielding twenty pounds of leaves each when three years old, that quantity being sufficient to produce one pound of cocoons. The *Ailanthus* tree is also successfully used for the *Attacus Cynthia* in Europe, America, and Australia, while Indian reports mention no less than

thirty-six silk-producing insects. The demand for "cheap and nasty" articles has infected the silk trade as much as any other, and we are told that the dyeing process is conducted for what are called "weighted goods," so as to make them from four to six times as heavy as the silk employed. Of course, such things do not wear well, and it is certainly contrary to sound art to convert silk, which is naturally a soft flowing material, into a sort of sticking-plaster that cannot fall into any graceful curve.

The use of make-weight rubbish is not confined to silk; the cotton and linen manufacturers frequently carry it to the extent of a gross fraud upon the consumer, who has no idea he is purchasing a comparatively useless article. This part of "British industry" is slightly alluded to by the writer on "Linen," and passed over by Mr. Watts in his account of "Cotton."

The mineral and chemical topics are well treated, and a perusal of them might save many persons from losing money in schemes that have no chance of success. For example, it is not long since speculators were imagining that they could make fortunes by turning into fuel peat-bogs which were lying close to cheaply-worked coal mines; but, as Mr. Galletly explains, "even when best prepared, peat never possesses more than two-thirds, and generally it has only half, the heating power of coal," and it is, of course, a wet, bulky substance, requiring great labour for its removal. It will no doubt be utilised at last, but it must be either when coal is very dear, or special facilities are found for drying and pressing the peat, of which Ireland is said to have three millions of acres, some bogs being twenty feet deep.

In the essay on "Oils and Candles" Mr. Mattieu Williams cautions artists against diluting linseed oil with turpentine, as it diminishes the proportionate quantity of the peculiar substance called *lineoline* which gives the oil its great value as a vehicle for colour. This substance does not contract in drying, and is elastic. Moreover, a film of it, he finds, can resist alcohol, turpentine, the fatty oils, wood naphtha, petroleum spirit, mineral naphtha, benzol, and even bisulphide of carbon, applied either hot or cold. These good properties are damaged by turpentine.

Mr. Patterson's essay on "Gas and Lighting" contains some very useful remarks upon burners and proper combustion. In most shops and houses gas is fearfully wasted by bad burners, with the result of making the air unwholesome, and damaging every article the fumes can reach.

In Prof. Church's article on "Minor Chemical Products," we find a passage that may be commended to those who cannot see the use of spending public money in promoting scientific knowledge. After remarking that while we stand at the head of other nations in alkali and acid works, he observes that

"if a rare and curious substance, discovered by a scientific chemist, and made painfully in his laboratory grain by grain, be found useful in medicine or dyeing, or some other art, straightway the foreign manufacturing chemist makes it, not by the ounce, or the pound merely, but by the hundredweight, or even by the ton."

This can be done because Continental Governments have given more encouragement to science, and their manufacturers are more liberal in expenditure for scientific aid than most capitalists here. Thus we read of

"one German chemical laboratory, which has six assistant chemists (not practical managers), and one chief chemist, a distinguished man of scientific reputation, to whom is given a salary approaching 2,000*l.* a-year simply for investigation and original work in the laboratory, not for superintending manufacturing operations."

The other volumes named in our list bear the same character as the preceding. They are pleasantly written, and contain a good deal of useful information; but, with a view of preserving their popular character, all stop short of the technical details necessary for practice. HENRY J. SLACK.

PHYSIOLOGICAL INVESTIGATIONS BEARING ON THE CONSONANTS.

Upsala Universitets Årsskrift: 1874. Philosophi, Språkvetenskap, och Historiska Vetenskaper: III. L. F. Leffler:—Några ljudfysiologiska undersökningar rörande Konsonantljuden. (Upsala, 1874.)

THE University of Upsala publishes an annual journal devoted to Philosophy, Glottology, and the Historical Sciences; one part of that for 1874 is taken up by Dr. Leffler's researches into the nature of the consonants—or, rather, I should say, by his first contribution on the subject, for as yet he has not got beyond the stopped consonants (*de klusila Konsonantljuden*). The first question he sets himself to answer is how many *p*'s, how many *t*'s, and how many *k*'s are heard in the Swedish words *tappa*, *fatta*, and *tacka* respectively; I am not sure that we have any English forms that would answer better than *tap*, *hat*, *back*, and the like. To any one who, like myself, has been searching in vain for something clear and intelligible on the question of double consonants the appearance of a work like the present must be very welcome.

As to Dr. Leffler's method of treating his subject, it may be said that he gives a great deal of room to the writings of those who are regarded as authorities on phonology: he passes many of them in review before the reader, and, by a severe application of the Socratic method of examination, he generally succeeds both in wringing from them important concessions and in convicting them of confusion and inconsistencies, which he skilfully turns to his own use. In the Swedish words already mentioned most people, he says, would answer that the *p*, *t*, *k* are doubled, but the phonologists of the present day pronounce this to be wrong. He sides with *οἱ πολλοί* against the latter, and begins with the examination of Brücke's account of the consonant *p* as produced either by the lips being suddenly closed or suddenly opened, or by both. Of the first kind Brücke finds an instance in the English word *midshipman*, and this is what Leffler terms an *implosive p*. But as implosive consonants are altogether pooh-poohed by some phonologists, he proves their existence at some length. However, anyone who will take the trouble to dictate to another person of average capacity for dis-

tinguishing linguistic sounds such syllables as *öp*, *öt*, *ök*, in any order he may please, without loosening the contact of the parts whereby the consonants are produced, will find that there is no difficulty in distinguishing implosive *p*, *t*, *k*.

Brücke's second kind of *p*, which Leffler calls explosive, is that in such words as *stamp*, *romp*, and the like. But his third kind is the one with which the latter is most closely concerned; this he finds to be no simple *p*, but to consist of an implosive *p* plus an explosive *p*, which may be so divided that the former goes with one syllable and the latter with another (as in the Italian *troppo*), as well as separated by a pause during which no sound is heard. This of course does not prevent Brücke from regarding them as forming one sound, as he has chosen to regard linguistic sounds as positions of the organs of speech, and not as acoustical effects, although his book is called *Grundzüge der Physiologie und Systematik der Sprachlaute*. So, to return to the point from which we started, Leffler shows that in such words as English *tap*, *hat*, *back*, we sound two *p*'s, two *t*'s, and two *k*'s—that is, an implosive *p*, *t*, *k*, followed by an explosive *p*, *t*, *k*; but if a long vowel precedes, the case is not quite the same; for after a long vowel most people sound no implosive *p*, *t*, *k*, but only the explosives corresponding. In my own case I find that if I pronounce *öp*, *öt*, *ök* without loosening the contact of the organs so as to produce the explosive consonants, the foregoing syllables are not to be distinguished from one another or from *ob*, *od*, *og*.

Enough has already been said to show that Dr. Leffler was not the first to notice the distinction between implosive and explosive consonants; but while that distinction turned up occasionally, and as a disturbing element, in most other works on phonology, he has succeeded in making a scientific use of it to clear up a point of considerable difficulty.

In the course of his discussion of *p*, *t*, *k*, he has some good remarks on the sound which is found, for instance, between the *p* and the *m* in *midshipman*, and is produced by the passing of the air from the cavity of the mouth into the passage leading to the nose. When it occurs between *p* and *m*, *t* and *n*, or *k* and *ng*, it is voiceless, but between *b* and *m*, *d* and *n*, or *g* and *ng*, it is voiced. The latter is common in English in such words as *cabman*, *kidnap*, and in *harden*, *garden*, and the like, when they are pronounced *hard'n*, *gard'n*, &c. A clear understanding as to the nature of these two sounds would, I think, have imparted more precision to M. Bergaigne's account of the Sanskrit *anusvāra* some time ago in the *Mémoires de la Société de Linguistique de Paris*, as well as to that of his opponent, Prof. Whitney, who remarks that M. Bergaigne is wrong as to the sound of *n* in the English word *mutton*, which the Professor asserts (ii. 195) to be the same as the *n* in *tend*, or even in *ten*, whence we must conclude that *mutton* is not commonly called *mutt'n* in the United States of America.

Dr. Leffler is not so well acquainted with the later works of the veteran English phonologist, Mr. Ellis, as one might think de-

sirable; but he has read his *Essentials of Phonetics*, and the mysteries of English orthography have led him to the conclusion that Mr. Ellis is not particular about doubling consonants, as he there spells his own name *Elis*, which Leffler evidently takes to be pronounced *El-lis*, a mistake which will be readily forgiven him.

In the latter part of the treatise the author discusses with great clearness the difference between *p*, *t*, *k*, and *b*, *d*, *g*. Pursuing the same method of cross-examination, he gives an important place to the testimony of German phonologists that Germans can, and frequently do, sound their *mediae* without accompanying them with the action of the vocal chords. On the other hand, he makes it appear probable that it is possible, though neither usual nor easy, to pronounce *p*, *t*, *k* with the tone. So the definition of *tenues* and *mediae* resting on the absence or presence of the tone turns out to have no scientific value, and one has to fall back on the nature of the contact between the parts of the mouth in speaking. Here he maintains that the pronunciation of *p* as compared with that of *b* implies not only that the lips are brought together more forcibly, but that for the moment their texture is harder and firmer; that is to say, you not only strike harder, but one or both of the substances you strike together are themselves harder; so with respect to *t* and *k* as compared with *d* and *g*. Thus it would seem to follow that, of all the terms applied to *tenues* and *mediae*, *hard* and *soft* are logically the most correct. J. RHYS.

SCIENCE NOTES.

ASTRONOMY.

The August Meteors.—This well-marked meteor shower has been carefully observed by M. Chapelas, who finds that there is a great falling off in its brilliancy since last year, the number of meteors seen being about the same as in 1859. It must be remarked, however, that the brightness of the moon interfered much with the visibility of the smaller meteors. M. Chapelas finds as the result of his observations that during the nights of the 9th, 10th, and 11th, about thirty-five meteors per hour were seen on the average, though few of them were remarkably brilliant. They appeared to radiate from the constellation Cassiopeia, and not from Perseus, as is usually the case; but this slight difference is not of much importance, as there is always some diversity in the directions in which the individual meteors are travelling, and consequently also in their radiant points. The connexion of the August meteors with the great comet of 1862 causes special interest to attach to these recurrent showers, more especially since recent researches with the spectroscope have shown that the gases they emit when heated are compounds of carbon giving the same spectrum as that observed in comets.

Supposed Transit of Vulcan across the Sun.—In a letter to M. Le Verrier, M. Wolf announces that M. Weber at Peckeloh saw a round spot on the sun on April 4 at 4.25 Berlin mean time, which, if it were the supposed planet Vulcan, would follow M. Lescarbault's observation by 148 periods of 42.02 days. In these days of telegraphy it is a pity that use was not made of the convention with the telegraph companies, to communicate this discovery at once to observatories where photographs of the sun are regularly taken; and it seems strange that so many months should

have been allowed to elapse before any notice was taken of the observation. Although the sun was without spots both on the morning of the 4th and of the following day, it is possible that a small circular spot may have broken out and closed up again rapidly. In the absence of all information as to the position and movements of the spot, any explanation, however, must be mere guesswork; but if a photograph can be found taken near the time of M. Weber's observation, the question will be readily settled.

A Miniature Transit-Instrument.—In the Scientific Loan Collection at South Kensington is exhibited a portable transit-instrument by Steinheil, in which the telescope-tube forms the axis of the instrument, the rays of light from a star being reflected into it by a right-angled prism fixed outside the object-glass and turning with it so as to sweep in the plane of the meridian, the telescope-tube lying east and west. A somewhat similar instrument on a very much smaller scale has now been constructed by Steger of Kiel, and is described by Dr. Peters in the *Astronomische Nachrichten*. The whole fits into a box six inches square, and is a marvel of compactness; but it is a question whether an ordinary sextant would not serve the purpose of determining time better, as the adjustments of a small transit are not easily determined with accuracy, and are very liable to disturbance, so that portable instruments are apt to become mere toys unless handled with extraordinary care.

Personal Equation in Transit Observations.—Sixty years ago Bessel found that there was a systematic difference in the observation by different observers of the time of passage of a star across the wires of a transit instrument, and to this difference the name of personal equation was given. The determination of this correction has long been recognised as a question of great importance, especially since the application of telegraphy to the determination of longitudes reduced all other errors to comparatively small amounts. In a paper read before the Irish Academy, Mr. Dreyer has discussed the various experiments that have been made on this point, and has collected a large amount of information on the subject. The difficulty of explaining the origin of this error still remains, though some light is thrown on it by physiological experiments on the rate at which nerve-sensations travel, and the time required to produce an impression on the brain. At first sight it might be supposed that the employment of two senses—the eye in noting the place of the star, and the ear in listening to the beat of the clock, or to the tap with the contact key made by the observer in the chronographic method—might have much to do with it, as there might well be error or personality in comparing two different kinds of sensations; but the same error is found when only one sense is concerned, and M. Wolf, of Paris, concludes that personal equation is to be referred partly to an habitual error in bisecting an object, and partly to the persistence of impressions on the retina, which allows the mind to refer a moving object to any part of the path through which the body moved during the duration of the impression. In fact, according to this view, the real image of a star would be a line of length representing the motion in about an eighth of a second, and by a mental process the star would be referred to one end or other of this line. These and other results have been obtained by means of contrivances of various kinds in which an artificial star can be made to cross the field of view, the exact instant at which it passes each of the wires being known and compared with the times recorded by the observer, so that the absolute error of his observations is known. In the observations with real stars it is only the difference between two observers which can be found, and there is no deciding which is most in error. The amount of the error is surprising when it is considered that skilled observers

are concerned, who can be relied on not to vary more than a twentieth of a second either way in their habit of observing. Thus Bessel found that his personal equation (as compared with other observers) gradually increased in a long course of years, until it exceeded a whole second of time; and, even with the chronographic method of observing, differences of three-quarters of a second are frequently met with. It was for a difference of this amount that Maskelyne dismissed his assistant Kinnebrooke, personal equation being then unheard of.

Photometric Experiments on the Light of Venus.—The principle of comparing the intensities of two lights by means of the shadows cast by them, which was introduced by Rumford, has been applied by Mr. Plummer to the determination of the brightness of Venus, his results being given in the *Monthly Notices*. Mr. Plummer found that the shadow cast by Venus was distinctly visible; and from a series of observations made about the time of greatest elongation, he concludes that the light of Venus at greatest brilliancy is about 1-800th of the full moon, and equivalent to that of a standard sperm candle at a distance of 247 feet. One interesting fact results from Mr. Plummer's measure—viz., that, like the Moon, the surface of Venus is not smooth, since its brightness increases as it approaches the full phase much more rapidly than would be the case with a polished body. Mr. Plummer's observations, however, extend over too short a period to decide the question. From a long series of observations of the moon, Zöllner found that the increase in brightness indicated an average slope of 52° in the inequalities great and small of the surface, and it will be interesting to see whether similar results are found for other bodies. Mr. Plummer's conclusion would seem to show that the light of Venus is not derived by reflexion from cloud in its atmosphere, but from the surface of the planet itself. It is worth mentioning that Mr. Plummer also succeeded in obtaining a shadow from Sirius.

Proper Motion of Spots on Jupiter.—On examining Jupiter on three successive occasions, at intervals of five and seven days respectively, Mr. Brett has remarked a pair of bright spots which showed such a striking similarity that he could only conclude that they were reappearances of the same objects. On comparing their positions, however, with those which would be given by the accepted period of rotation he found considerable discordances, leading to the conclusion that in the first interval the two spots had drifted forward at the rate of four minutes in each revolution, and in the second interval at the rate of seven minutes and a quarter, besides changing their relative positions. As Mr. Brett has inferred from the fact of these spots casting shadows that they are bodies of approximately globular form, there seems a little difficulty in explaining a drift at the rate of 165 miles an hour of globes of 6,000 miles in diameter, which must be wholly immersed in the atmosphere, since they disappear as they approach the limb. At such a depth as 6,000 miles it is not easy to realise the condition of Jupiter's atmosphere, as the pressure must be enormous, especially considering that the force of gravity on Jupiter is two and a half times as great as on the earth. Mr. Brett's views are, however, supported by Mr. Burton, who has concluded that light can penetrate to a depth of 10,000 miles below the visible surface of Jupiter, and the small specific gravity of this planet tends to countenance this idea.

In the June number of the *American Journal of Science and Arts* there appears a short article on "The Curve of Eccentricity of the Earth's Orbit," by Mr. R. W. McFarland, of the Ohio Agricultural and Mechanical College, Columbus. Mr. McFarland has performed the task—one of great labour—of testing the accuracy of the tables given by Dr. Croll and by Mr. Stockwell. Dr. Croll, it will be remembered, computed the values by Le

Verrier's formulae, and Mr. Stockwell by formulae of his own. Mr. McFarland has now recomputed the values by Le Verrier's formulae, and finds "Croll's figures correct in most cases and not in error to the amount of .001 except in one instance."

Causes affecting the Intensity of Sound in the Atmosphere.—In a letter to the *New York Tribune*, published in July last, Dr. J. C. Welling draws attention to certain historical inaccuracies of which he alleges Dr. Tyndall to have been guilty in the last edition of his work on *Sound*. Dr. Tyndall, in this edition, gives an account of the researches which he carried out in the year 1873 with a view to the discovery of the causes which affect the transmission of sound through the atmosphere, and the narrative of his researches is prefaced with a "summary of existing knowledge" on this subject before the commencement of his own investigations. In this summary he makes the statement that the publication of Dr. Derham's paper in the *Philosophical Transactions* for 1708 marks the latest systematic enquiry into the causes which affect the intensity of sound in the atmosphere, and that his own investigations, begun in the spring of 1873, were designed to fill the blank; that fogs, according to Derham, tend powerfully to obstruct the propagation of sound; that, as a consequence, optic transparency came to be considered a measure of acoustic transparency; and that these views up to 1873 were universally entertained, and had been transmitted unquestioned from generation to generation of scientific men. Dr. Welling contests the accuracy of these historical statements. He points out that Dr. Derham's celebrated paper "De Soni Motu" relates almost exclusively to the motion of sound, and only incidentally to the intensity of sound in the atmosphere; that Derham's observations as to intensity are of the most meagre description, while the conclusions drawn from them are contradictory and inconsequent to the last degree; and that the paper has no claim to be considered a systematic enquiry so far as the intensity of sound in the atmosphere is concerned. He alleges also that Prof. Tyndall, in consequence of his having probably never read Derham's paper, misrepresents that writer's views. Dr. Welling is severe on Dr. Tyndall's statement that a blank existed as regards this subject from 1708 until the date of his own researches, thus ignoring the systematic observations of Humboldt, communicated to the Academy of Sciences of Paris in 1820, and those of Prof. Henry, carried out in 1872. Humboldt stated, as the result of his observations in South America, that "the intensity of sound is the same in dry air and in air mixed with vapours," and, again, that "the hygrometric state of the air has no influence at all on the propagation of sound." In the presence of such precise declarations, what becomes, asks Dr. Welling, of the statement in the summary that, prior to Dr. Tyndall's investigations, the views enunciated by Derham, Herschel, and Robinson, "were those universally entertained"? Prof. Henry, the chairman of the United States Lighthouse Board, had been conducting systematic enquiries into the causes which affect the intensity of sound, with special reference to the question of fog-signals, for some time before the beginning of Dr. Tyndall's researches, and had communicated some of his results to the Washington Philosophical Society at a meeting at which Dr. Tyndall was present. It appears from the passage which Dr. Welling quotes from Prof. Henry's paper that the latter had at that time come to the conclusion that the existence of fog is a true but an insufficient cause of the diminution of sound, a view borne out by the immense distance at which signals in his experiments were heard during a dense fog. Dr. Welling's criticism amounts to this, that Dr. Tyndall's "summary of existing knowledge" is superficial and inaccurate; that Dr. Tyndall had probably not read either Derham's or Humboldt's original papers; that he was well acquainted with the fact of Prof.

Henry's experimental enquiries relating to the transmission of sound through a fog-charged atmosphere—inasmuch as he was present at a meeting at which some of Prof. Henry's results had been made known—and that, with these facts before him, he was scarcely justified in saying that as regards the causes which affect the transmission of sound through the atmosphere a blank existed from the year 1708 until the date of his own researches.

PHILOLOGY.

Les Principes de Comparaison de l'Accadien et des Langues touraniennes. By Fr. Lenormant. (Paris: Maisonneuve.) This is an answer to M. Ujfalvy's criticism of M. Lenormant's work on the Accadian language already reviewed in the ACADEMY, and to the Finnic scholar's denial of the Ugrian affinities of the primitive language of Chaldea. M. Ujfalvy's criticism had been brief; M. Lenormant's answer is also brief. But in it he not only seems to us fairly to make out his case, but also to make some important additions to our knowledge of the Accadian language itself. He has done good service in calling attention to the large extent to which that language had been affected by phonetic decay at the time when we first become acquainted with it, and has selected some good examples of this fact. M. Ujfalvy, in spite of his subsequent disclaimer, really appears to have misunderstood M. Lenormant's view of the linguistic position of Accadian. It is not a Ugrian language—far from it—but forms a member of a new group which has to be added to the Ugro-Altaic family of speech, and its grammatical (not lexical) affinities are more with the Ugrian than with either the Tatar-Turkish or the Mongolian branches of the family. Nothing but good can come of the discussion now raised as to the "Turanian" character of Accadian, and we may point to the monograph before us as well as to M. Ujfalvy's paper, to which it is a reply, as a proof of this. But it would be well if those Finnic scholars who have taken up the question would examine Accadian at first and not at second hand; in a progressive and tentative study like that of Accadian only those who are actually engaged in deciphering the inscriptions can tell what is certain, what is probable, or what is only possible. The single strong argument brought against the Turanian relationship of Accadian is the prefixing instead of the postfixing of the personal pronouns and conjugation-suffixes to the verbal root; and this argument is disposed of by the complete evidence we now have that the pronouns and suffixes were originally postfixes, and only prefixed at a comparatively late date, through the influence, it would seem, of Semitic. If, however, we really wish to test the affinities of Accadian we must bear in mind its great distance in space and time and social conditions from any of the modern Turanian idioms, and compare it in the first instance with its nearest neighbours the languages of Elam and Media. Now, the Turanian affinities of Protomedic and Susianian are undoubted; anyone who will take the trouble to investigate the matter will find that the relationship of Accadian to Protomedic and Susianian is undoubted also.

Zeitschrift der Deutschen Morgenländischen Gesellschaft, xxix. 3 and 4. This volume of the *Journal* contains much that is extremely interesting. Landauer gives the Arabic text, with translation and notes, of Avicenna's Psychology, which ought to claim the attention of all students of philosophy. Nöldeke contributes some valuable papers on "The Topography and History of the Districts round Damascus and the Hamrân," and on that curious forgery, "The Nabathean Agriculture" of Ibn Wahshiya. Lauth translates the great inscription of Sesostris at Abydos, and Böhtlingk writes on "The Relation of the Three Hindu Standard Grammarians to Roots in the Vocabulary beginning with *sh* and *ṛ*." Gold-

schmidt follows with an article on "Prakrit Formations from Passive-Stems," and Zingerle gives some interesting specimens of the "Paradise" of the Syrian Metropolitan Ebedyesu. Blau has an elaborate paper on the language of the Kumanis of Southern Russia, in which he shows conclusively that Prof. Max Müller was right in referring it to the Turkish group; Euting communicates an important inscription from Carthage, which treats of the sacrificial dues paid to the priests; and D. H. Müller analyses and translates five Himyaritic inscriptions. Kämpf has a short article on the round numbers in the Canticles, and the rest of the volume is filled with Oriental intelligence and reviews of books. Among the latter may be mentioned an appreciative notice of Mr. S. L. Poole's *Coins of the Urtukis*, by Dr. Blau.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY.—(Wednesday, Sept. 6.)

J. JENNER WEIR, Esq., F.L.S., in the Chair. Mr. Edward Saunders exhibited some recently-captured Hymenoptera and Hemiptera, many of them rare in this country, and made some remarks respecting the bug of the House Martin, of which he had taken eighteen specimens on the window-sills of a house. Mr. Weir mentioned that on a recent visit to the South Downs he had suffered much annoyance from the attacks of harvest-bugs, as many as eighty pustules appearing on each foot. Several remedies were suggested, especially rubbing the affected parts with brandy and water; but Mr. Smith stated that on one occasion, when he was in the Isle of Wight, and exposed to their attacks, he had found that by taking a dose of milk of sulphur he was effectually relieved from all annoyance.—Prof. Westwood communicated a note with reference to some shoots of horse-chestnut which he had exhibited at the July meeting of the Society, having been destroyed, apparently, by some lepidopterous larvae or wood-boring beetles; but he had since received from Mr. Stainton some shoots that had been forwarded to him by Sir Thomas Moncreiffe, which had been destroyed by squirrels in precisely the same manner. Sir Thomas had himself seen the squirrels at work splitting the shoots with their teeth, and extracting the pith.—Prof. Westwood also stated that he had received from a correspondent in Oxfordshire specimens of the two small species of grasshopper with long antennae, *Meconema varium*, Fab., and *Xiphidium clypeatum*, Panzer, which he had taken on a pear-tree in his garden, where they had been regularly observed for the last five or six years. Mr. McLachlan said that the former insect was frequently observed by Lepidopterists when sugaring for moths.—Mr. Smith communicated the descriptions of three additional species of *Formicidae* from New Zealand, which had been sent to him by Mr. David Sharp since his description of Mr. Wakefield's collection was in the press. Two of the species belonged to genera not previously ascertained to inhabit New Zealand—viz., *Amblyopone* and *Poneræ*.—The following memoirs were read:—"Monograph of the Dipterous Genus *Systropus*, with Notes on the Oecology of a new Species of that Genus," and "Descriptions of New Genera and Species of *Acroceridae*." Both were communicated by the President, Prof. Westwood.

FINE ART.

ATTAVANTE, MINIATURIST OF FLORENCE, AND HIS PRINCIPAL WORKS.

AFTER the dawn of the Italian Revival of Art the various Mediaeval styles of illumination or the decoration of manuscripts developed definitively into two distinct and widely diverse schools of miniature-painting. One, following the lead of the Netherlandish masters, betook itself to the matter-of-fact, not to say servile, imitation of Nature. The other, attaching itself to the diligent study of classical remains, produced the elaborate ideal and exquisitely-refined system of decoration known as the "Cinquecento," the perfect development of Italian Renaissance. Both of these schools have bequeathed us works of mar-

vellous excellence. The Netherlandish and its offshoots, in such volumes as the "Grimani Breviary" at Venice, the "Flora" at Naples, and the "Hours of Anne of Brittany" at Paris. The Cinquecento in the magnificent Graduals preserved in the Brera Library at Milan, the great Antiphonaries of the Cathedral at Florence, and the numerous sumptuous volumes executed for royal, noble, or ecclesiastical patrons during the great Medici period of Italian literature.

To this school of the Cinquecentisti belongs the miniaturist whose works form the subject of the present memoir. Of his personal history little or nothing is accurately known, but a MS. in the Magliabechian Library at Florence tells us that he was called Attavante, or Vante, son of Gabriello di Vante di Francesco degli Attavanti. It is possible that he belonged to a family which had given magistrates to his native city; for in a book of arms borne by noble Florentine families, preserved in the British Museum, occur those of the Attavanti, their shield being *azure*, a saltire *or*. This Attavante, the miniature-painter, is mentioned several times by Vasari: in the Life of Angelico he is spoken of as a contemporary and as the painter of some exquisite miniatures in a Silius Italicus once belonging to the Church of S. Zanipolo at Venice; in that of Don Bartolommeo (della Gatta) as a disciple or imitator; and in that of Gherardo as probably a companion. From all which it may be gathered that Vasari's information respecting him was mere hearsay. The story of the Silius Italicus, the miniatures of which Vasari describes with the utmost minuteness, has been severely criticised and even absolutely contradicted. Morelli (*Notizie d' Opere di Disegno*, p. 171) says of it, "All is good in this description, except the name of the author . . . the work illuminated by Attavante is a Codex of Martianus Capella." Rosini simply remarks (vol. iii. p. 154) that the MS. has vanished altogether, or, at any rate, that all his searching for it was in vain. But Signor Valentini, the Librarian of San Marco at Venice, declares that it still exists, and is one of the specially select MSS. of that library, but whether an Attavante or not, unluckily, he does not say; and when the present writer was in Venice it did not occur to him to ask about it.

As Attavante worked so much for Corvinus, there can be no doubt that he was one of the artists specially employed by that monarch in illuminating books for the Royal library at Buda. Among those thus employed were Antonio de' Sinibaldi—probably as a writer—the two Boccardini, and the brothers Gherardo and Monte di Giovanni, whose very exquisite work may still be seen in the Antiphonaries of the Duomo, in the Laurentian and Riccardiana Libraries at Florence, and in the Barberini and other libraries in Rome. Indeed, it would seem from their works as if several of these artists worked in concert and from the same models, if not, in fact, under the same master or masters, at one time showing a leaning towards Botticelli, at another towards Ghirlandaio, and all perhaps following the common Florentine practice of studying the frescoes in the Church of the Carmine across the Arno, which may be called their common school of art from Masaccio and Lippi downwards.

After the death of Corvinus in 1490 Attavante worked at the service-books of the Cathedral. In the account books of the "Opera del Duomo" after 1500, occur several memoranda of his performances; among the rest, the following:—"1511, 3rd Dec. Vante received 50 lire 10 soldi . . . for two headings in miniature inserted in a Dominical for the Choir of the Duomo, with other letters great and small, &c." And this is the last mention of him that can be found. Dr. Waagen, indeed, in the supplementary volume to his *Art Treasures in Great Britain*, mentions an Antiphony executed for Leo X. between 1513 and 1521 as being the work of Attavante, and this may possibly be the case; but from one or two instances in which the learned doctor has

betrayed his inaccuracy when speaking of such matters, we cannot confidently rely upon his statement. How much later than 1511 Attavante may have worked, of course we cannot tell, but if Vasari's account of him be true, that he was a contemporary of Fra Angelico who died in 1455, he must have practised as a miniaturist for over fifty years. Yet this lengthened career is by no means singular. Both Girolamo dai Libri and Clovio exceeded it.

In prescribing a date for the better known of Attavante's works, we may say generally that they lie within the thirty years from 1480 to 1510. The last years of the fifteenth century, perhaps, saw the culmination of his skill, for nothing in his own works, or even in the whole range of Cinquecento ornament can be shown more perfect or elaborate than the title-pages or "headings" in the Breviaries, &c., executed for Corvinus. As to his skill in figure-painting, rather a lower estimate must be taken. In this portion of his art he probably never was the equal either of Gherardo or Boccardino, his contemporaries, not to mention the leaders of the Lombard or Roman schools. It is remarkable that his execution is always more or less suggestive of some greater artist without attaining to absolute rivalry. Thus in the *Martianus Capella* at Venice we are continually reminded of Sandro Botticelli, as we are in the Brussels Breviary of Ghirlandaio, and in the Vatican Breviary even of Perugino. Possibly he was in fact a sort of Luca Giordano in little, the *Proteus* and *Fa presto* of his class. He lacks the individuality of many other miniaturists in this particular, being not comparable with Gherardo, and yet to those most familiar with his work there is a certain signature which declares its authorship. His work in some instances has been assigned to Girolamo dai Libri, in others to Giulio Clovio. For the former, or, indeed, for either of these blunders, there can assuredly be no excuse, as their styles are as distinct as possible. In forming the catalogues of the great public libraries of Europe, it has too often been the practice to assign MSS. to Girolamo or Clovio, or other famous artists, merely on the strength of their reputation. We have at this moment in England examples distinctly in the manner of Clovio, and others in that of Attavante, set down to Girolamo, and he has even been credited with rivalling the Urbino arabesques of Girolamo Genga, and Raffaello dal Colle. Throughout our libraries Girolamo is decidedly the favourite, and if he were capable of half the variety of styles attributed to his pencil, his versatility must have been something astounding. But the fact is that most of these second-hand criticisms are traceable to the imperfect indiscriminating descriptions and unqualified eulogies of Vasari. Anybody who has seen the very peculiar manner in which Dai Libri always worked, never leaving the old Veronese traditions, must at least be able to negative all such groundless assertions. It may sometimes be difficult to avoid confounding Attavante with Gherardo or Boccardino or Fra Eustachio, especially in ornamentation, but with Clovio or Girolamo it is preposterous. The principal characteristics of his work are thus enumerated by the Florentine editors of Vasari (Lemonnier's edition, vol. vi. p. 175).

"He is mean in the general character of his figures, meagre in design, faded and cold in his flesh-tints, and rough in execution. His handling, whether in draperies or figures, is equally laboured throughout, and his choice of colours harsh and inharmonious. The extremities, eyes, eyebrows, &c., of his figures are defined with a dark-brown outline, the airs of his heads without variety, the beards often grey, with fine pencillings of white. The eyes have the lids usually somewhat lowered, giving a languid or tearful expression to the face. The folds of his draperies are drawn with a monotonous want of intelligence, and his pictures generally fail in telling the story with effect. In the ornaments, on the other hand, he is wonderful for the classic elegance of his style, and for the exquisite finish of his execution."

This account, though perhaps unjustly severe on his higher qualities, will nevertheless afford points by which to discriminate his work, and to distinguish him from his contemporaries. His defects are more or less those of all his fellow-miniaturists in Florence, as they are of all those who seldom or never have the opportunity of working out their designs on a grander scale. It cannot be expected that the energy or grace which are admired on the walls of the Vatican, or of the Palazzo Vecchio, can easily be compressed into the two or three square inches of an initial in a service-book. Those miniaturists naturally have the advantage in point of style who at times emerge from the pages of their books, and air their fancies on some ampler and more public field.

It has always been a difficulty with students that the old illuminators had so universal a habit of leaving their work unsigned, even when of the highest class. With ecclesiastics and members of the religious orders, this was the rule. Laymen sign occasionally; but, with few exceptions, evidence arising from a careful comparison of characteristic peculiarities, or some external aid in the shape of historic record, has generally to be our guide. Among the somewhat numerous masterpieces of Attavante, fortunately a considerable number are authenticated with his name, two or three in a very prominent manner. In the noble MS. in the Library of S. Marco at Venice, containing two treatises by Mineo-Marziano Felice Capella, and called in consequence the "*Martianus Capella*," the signature is the same letter as the other headings and labels throughout the volume. In the great Brussels folio, inherited from Corvinus by the Dukes of Burgundy, and at one time the property of the Emperor Charles V., both character and signature attest the artist, while in the Vatican Breviary, which is not signed, concerning which there has been some diversity of opinion, the general conclusion is now in favour of Attavante. Indeed, the work itself, to a careful observer, carries its own proof, while in some respects this folio and the one at Brussels are absolutely alike.

The following list includes all MSS. containing work by Attavante about which I have any information:—

1. The Corvinus Bible in the Vatican Library, Rome.
2. The Corvinus Breviary in the same library.
3. The Breviary of Charles V. in the Royal Library, Brussels (signed).
4. The *Martianus Capella* in the library of S. Marco, Venice (signed).
- 5, 6, 7. Three Antiphonaries in the Duomo, Florence—

No. XI. marked "I,"
No. XII. "K,"
No. XIX. "S,"

(authenticated by the account books of the Duomo).

8. A *Diurnale*, once belonging to the monastery of the Angeli, Florence, called *Diurno dalla domenica della SS. Trinità all' avvento*, in the Laurentian Library, Florence (authenticated).

9. Comment of S. Thomas on *Book I. of Sentences*, in the Estense Library, Modena (signed).

10. Homilies of S. Gregory on Ezechiel in same library (signed).

11. *Hexameron* of S. Ambrose, in same library (signed).

12. S. Augustine against Faustus et Julianus, in same library (signed).

13. *Amnianus Marcellinus*, in same library.

14. *Dionys. Halicarnass. Ant. Rom.*, in same library.

15. Certain writings of Georg. Merula, in same library.

16. Homilies of Origen, in same library.

17. A Roman History, by Orosius, in the Arsenal Library, Paris (H. R. 71 B).

18. An Antiphonary, executed for Leo X. between 1513 and 1521, containing a title-page

attributed by Dr. Waagen, in the library of the Duke of Hamilton.

19. A number of Corvinus MSS., of which some are on good authority said to be Attavante's, in the Trivulzio Library at Milan.

20. A *Livy* in 5 vols., and several other MSS. in the Imperial Library at Vienna.

21. A MS. in the Royal Library at Munich.

22. Another in the Imperial Library at St. Petersburg.

23. Another in the Public Library at Besançon.

24. A *Book of Hours* in the National Library, Paris, said to contain a title-page by Attavante (Suppl. Lat. 701).

25. A MS. executed for the Bishop of Gran, near Buda, in the same library.

Of these five-and-twenty MSS. I can only describe such as I have examined. Others less authentic, reported from other collections, I omit altogether. I am sorry that among these I must include some attributed by Dr. Waagen, such as that in the Soane Museum—called, by the way, in the library catalogue a *Girolamo dai Libri*, but most certainly neither one nor the other. For the rest, my authorities are the following:—

Those in the Estense Library I first saw mentioned in Tiraboschi (vol. vi., part 2, p. 1,173, Firenze, 1809), but happening to name them to Dr. Anziani, of the Laurentian Library, Florence, I was assured they were still there, and were among the finest examples of Attavante in existence. This account was afterwards confirmed by Dr. Ceriani, Prefect of the Ambrosian Library, Milan; and I have since met with further confirmation in the shape of a list and description by the Librarian of the Estense Library itself, Signor Cavedoni. His list differs somewhat from that of Tiraboschi.

1. S. Augustini contra Faustum et Julianum.
2. S. Ambrosii in Hexameron.
3. S. Gregorii Magni Homiliae.
4. S. Gregorii Magni Dialogi.
5. Ammiani Marcellini Historiae.
6. Dionysii Halicarn. Antiqq. Romanae.
7. Georgii Merulae opera varia.

To which have been transferred from the library at Pesth:—

8. Johannis Chrysostomi Homiliae.
9. Seti. Hieron. Comm. in Seti. Pauli Epistolas.

"The first seven of these MSS. are in folio, written on vellum, and the miniatures are placed on the first pages, back and front, facing each other. There are initial letters at the commencement of each book. On the first blank side of the frontispiece of St. Gregory's Homilies are the words '*Attavantes pingit*' (sic). On the first recto of each volume occurs, written in golden capitals, the title of the work or works contained in the entire volume. The pages are framed in bands of gold, with foliage and fine embroidery of pen-work, among which are placed symbols relating to the text,* and which are most frequently a tun, a well, an hour-glass, or an armillary sphere—occasionally with an ox, a winged dragon having its tail passed round its neck, with a flint and steel, and other emblematical objects, which we see repeated on the opposite page. The painting of the first recto occupies the whole margin of the page, and consists of lovely arabesques in brilliant and beautiful colours, enriched with gilding and interspersed with armorial bearings, little Genii and symbols. At top are the arms of the kingdom of Hungary, below, those of Matthias Corvinus. In the four corners and in the centre of the vertical borders six busts or half-lengths in medallions, corresponding one to another—for example, a bearded man and a fair woman, Pallas and Hercules, a damsel and a youth.

"In the MSS. of the Fathers we find the four

* Here Signor Cavedoni is somewhat in error. The symbols are not so much relating to the text as to the owner of the book—the patron for whom it was illuminated. The above symbols occur in other Corvinus books, irrespective of the subject

Evangelists at the four corners, and two prophets in the lateral columns. The six half-lengths of the frontispiece of Dionysius of Halicarnassus are remarkably beautiful; they are all of youthful aspect, and for the most part they seem to be, like the other figures, portraits of living persons. The first initial letter, enriched with ornaments in gold and filigrees, contains the bust or full-length figure of the author of the works contained in the volume. These figures are executed with a fullness and elegance that are surprising. In some of the MSS., as in that of St. Ambrose, all the initials of each book repeat the portrait of the author with different expressions, and with a singular elegance of ground and of constantly varied golden filigrees."

Such is the description of the librarian, which, though brief, is sufficient to prove that the MSS. are veritable examples of Attavante. It corresponds exactly with the character of his work in the *Martianus Capella*, and all other MSS. authenticated as from his hand. Nor is there any reason to suppose that the signatures are not genuine. Tiraboschi tells us that the *Modena Collection* was bought by Cardinal Ippolito D'Este in Hungary, after the death of Corvinus, which, as the Cardinal resided at the Court of Buda, is highly probable; or, rather, that the Duke Ercole I. on the news of Corvinus's death, bought those MSS. which were in course of preparation at Florence; but certain documents are in existence which prove them to have been actually acquired at Venice about the year 1561 from Girona Faletti, at the cost of the Duke Alfonso II.

To return to our list, Dr. Ceriani informed me, moreover, that the *Trivulzio Library*, Milan, contained a number of Corvinus' books, some of which he was certain were Attavante's. He kindly offered me an introduction to the *Marchese Trivulzio*, had my time permitted. At some future opportunity I hope to avail myself of the privilege of examining these fresh treasures.

Of No. 17, though stated by Dr. Waagen to be an Attavante, I am very doubtful. It has, in fact, none of the characteristics of the work known to be that of Attavante. I should say it is later work. The Curator of the MSS. in the Arsenal Library gave his opinion that it was a *Clovio*; and certainly, with the exception of the two great pages *vis-à-vis* at the commencement, which are the only portions possibly assignable to Attavante, the style of the numerous initials carrying fine medallions of the Roman emperors, as well as that of the truly magnificent miniatures, points decidedly more to *Clovio* than to Attavante. There is a MS. with similar work in the Library of the Brera at Milan. For 18 I am indebted to Dr. Waagen, but, not having seen it, I hesitate to speak with certainty of its characteristics. For 19, as already stated, to Dr. Ceriani. For 25 to Dr. Waagen. For 20, 21, 23, and 24 to Dr. Anziani. For 22 to the Curator of MSS. in the Arsenal Library, Paris, who, aware of the principal characteristics of Attavante, told me that he had seen it, and that it was an undoubted and very fine example. This is all I know of it.

Nos. 1, 2, 3, 4, 5, 6, 7, 8, and 17, I have myself examined. Owing to the extreme difficulty of obtaining access to the Vatican Library for purposes of study, an available space of three weeks was shortened into as many days, thus leaving very little opportunity for minute examination. This, however, I have the less reason to regret, as the two folios here are so like the one at Brussels that a description of the latter, to which I had abundant access, will give a perfectly correct idea of them; at least, with but little supplementing from my scanty notes taken under the kindly surveillance of Dr. Martinucci. One of the miniatures, indeed—that representing the call of Peter and Andrew—appears to a superficial glance to be merely a variation, produced by reversing the sketch, of the same subject in the Brussels MS. In reality, however, the pictures are different, though the principal features are the same in both. On closer examination they are seen

to be distinctly two designs, not only in the positions of the persons forming the subject of each but in the details. There is a decided superiority of drawing both in pose and drapery in the Vatican miniature, which probably has led some to attribute its authorship to Gherardo rather than to Attavante. The backgrounds and accessories are also more elaborate than in the Brussels MS. But it has several of the minor signs, such as the dark *contour* to the features, and the mode of drawing the hands and feet; while the marginal ornaments, borders, and initials, are absolutely and without a shadow of doubt by the same hand in both MSS. The Vatican Breviary is on the whole perhaps a little more ornate than the Bible. Being composed of different sections or subjects, it is adorned with a number of different title-pages consisting of very elaborate architectural compositions made to enclose the inscription or title. Thus the first or general title—

INCIPIT ORDO | BREVIARII SEC[UNDUM] DVM C[ON]SVETV[DIN]E
ROMANE | CVRIE IN PRIMO | SABBATO DE AD[V]ERV
AD VESPE[RAS. CAPITVLVM.

is written in golden capitals on a framed slab or panel, supported by two angels in Florentine costume who kneel on the top of a marble altar. The ground of the panel is rich blue, the frame brown-gold—i.e. a gold frame shaded and modelled into a moulding in brown. The altar is elaborately decorated, and contains on its panelled front a delicately-modelled group, to imitate sculpture, of Neptune driving his chariot over the waves with the winds, like cherub-heads, blowing fiercely upon him from the corners. This part of the design is placed beneath a canopy of gold and marble resting on polished pillars of precious stone. The roof of the canopy is arched, the under-surface panelled. On each panel is placed a finely-modelled rosette in brown-gold on a ground of rich colour. The semicircular face of the roof is elaborately decorated with wreaths of fruit and foliage crossed with ribbons, while along its upper edge recline winged children as if looking over to see what is below. On the inlaid marble floor in front of the altar a child is playing with a monkey. The front-edge of this marble floor is enriched with delicate sculptured scrolls of Cinquecento foliage. Surrounding the two sides and foot of the central design is the usual Attavante bordering, containing elegant quatrefoil medallions carrying full-length female allegorical figures, smaller circlelets with the same symbols as in the *Modena* books already described—viz. the dragon strangling himself with his own tail, the tun, the hour-glass, &c. The borders are of different widths, the inner being one inch, the outer two, and the lower nearly three, an elaborate brown-gold moulding forming their framework. The whole interior surrounding the medallions, &c., is crowded with lovely scrolls or arabesques of foliage in profile, arranged with the most perfect symmetry yet without actual repetition, and terminating regularly in beautifully-modelled flowerets, such as are used in the finest examples of Roman or Italian sculpture. Rich jewels of gold, pearls and precious stones are embedded at intervals amid the foliage, while fair children or elegantly-costumed angels support the medallions. In the middle of the lower border is a grand group composed of six winged children surrounding the escutcheon of some cardinal who bore arms like those of Aragon, and not that of Corvinus, as in the Bible. Another of these title-pages, and one of the richest in the Breviary, is the title to the *Commune Sanctorum*. The usual Attavante borders surround three sides of the page, the lower border in this instance being unusually deep, and divided, as before, into three portions, exclusive of the sides. The central portion contains the escutcheon of Corvinus. In the midst of the two others are small oval medallions containing very finely finished allegorical figures. Winged children or Genii are distributed about the borders as supporters of the medallions or of other por-

tions of the ornament. Within this border is an architectural composition of wonderful and intricate design, of the kind we see in the backgrounds of pictures by Ghirlandaio, Mantegna, and other early Italian painters, but here appearing to be much more than usually elaborate, probably because of the minuteness of the work. It represents a kind of shrine or canopy supported by square pillars, the sunk faces of which are filled with exquisitely-finished ornaments in gold on a blue ground composed of groups of armour, trophies, musical instruments, &c., suspended at intervals on a string of ribbons with the lower ends flying out at either side from a gracefully-tied loop-knot. These pillars support over their lofty elaborate capitals a round arch, the sunk face of which is enriched with a Florentine Renaissance design in gold on a blue ground—the outer moulding of the arch being delicate lilac. The design makes this front arch one of four which face in four directions, and support an arched roof of two diagonal arches, which cross in the centre. Three of the face-arches are open, the fourth, which fronts the spectator, is filled in with a painting representing the Almighty in the attitude of blessing. It very faithfully depicts the Pope as he appears on certain festivals at the *façade* of St. Peter's. The roof is of green, stippled in *chiaroscuro* with black to great firmness and yet delicacy of finish. Beneath the cornice of this arch is a square blue tablet bearing in golden capitals the title of the following section of the book:—

INCIPIT COMMUNE SANCTORVM IN NATIVITATE, &c.

Beneath this again is a sort of altar, on the front of which is a bas-relief of two angels in Florentine costume supporting a wreathed medallion of our Saviour, on a black ground. The angels and wreaths are delicately modelled in white to represent marble. Beneath the bas-relief is a step—and then the marble floor inlaid in a lozenge pattern. Three figures of saints or disciples stand on either side beneath the receding arches. The nearest edge of the floor is sculptured like a frieze and serves as a frame for the lower border. The capitals and bases of the square pillars are gold elaborately hatched and stippled. In the corners above the arches are angels in white raiment on crimson grounds. The draperies of the persons standing at the side are ruby, green, and blue. The colours employed in the illuminated borders, the ornaments of which have been already described, are:—Upper half of left side, golden sculptured arabesques on blue; lower, gold on crimson. Lower border, side portions golden foliage on blue; centre, arms of the aforesaid cardinal on golden shield surrounded by a lovely green wreath containing daisies, on crimson ground. The effect of this page altogether is most superb; I can scarcely say which of the eight magnificent titles is the most attractive. One of them is interesting from the fact that on the front of the step which forms the edge of the floor is the date ANNO DOMINI MCCCCLXXXII. The altar-tablet above contains the inscription INCIPIT PRIV[ILEGIUM] SANCTORV PER TOTVM ANNI CIRCVLVM, &c. In those pages where a miniature occurs, as in the charge to Peter, the upper half is occupied by the miniature, the lower by the text in two columns. The former column is mainly occupied with a large initial richly designed, and containing a highly elaborate figure of some saint; the latter with the text, which is often burnished gold on blue or crimson. These columns of text are usually separated by a narrow bar or border of Florentine Renaissance foliage in blue or green, or crimson or gold, on a deeper ground of the same. This is also generally the arrangement of the Brussels MS., but not of the *Martianus Capella*. In the borders a very common arrangement is alternate blue and gold, having a framework of gems, or of cornice leaf-moulding. For brevity's sake I omit the description of other title-pages. On the ordinary pages the great initials are attached to borders of Renaissance flowers in very pretty

arrangements of pink, blue, green, and gold, with black-fringed globules of gold distributed among the foliage. In some instances the border encloses three sides only of the page, and runs up between the two columns of text. The last leaf is important as ending with a memorandum by the scribe:—

Ego martin' antonius presbyter dei gratia
faustissime manu propria scripsi.

Opus absolutum pridie k'l'as novembris
Anno salutis M^ccclxxxvij^o.

which shows that a period of five years had elapsed between the completion of the text and that of at least one portion of the ornamentation, and that this was not finished until two years after the death of Corvinus, for whom it had been commenced.

The Vatican Breviary, then, was one of the works referred to by Tiraboschi as in progress when Corvinus died. Who was the cardinal that completed it? His escutcheon is not to be found in any collection that I have been able to consult. It is *paly* of six, but whether *arg.* and *gules*, which from my hasty tricking it seems to be, or some other tincture, I cannot now feel sure.

I shall next proceed to describe the Brussels Breviary.

JOHN W. BRADLEY.

MANCHESTER AUTUMN EXHIBITION.

MANCHESTER boasts two principal exhibitions during the year. The first, in the spring, is held under the auspices of the Manchester Academy of Fine Arts; the second in the autumn, under the control of the Royal Manchester Institution. Between these two bodies there is no connexion beyond what is implied by the fact that the art gallery in which both exhibitions are held is the property of the Institution. The exhibitions themselves are entirely distinct in character, for on the one hand the Academy only affects to represent the art of Manchester, while the Institution takes a wider scope, and attempts to combine with the product of local talent a general representation of contemporary art. In the management of the two exhibitions there is again a further element of distinction of even greater importance. The Academy, following the model of the older establishment in London, is entirely composed of professional members, and the labour of selecting and arranging the works to be displayed falls entirely under the control of the artists themselves. The Manchester Institution adopts a system exactly the reverse of this. It is an establishment of long standing, dating as far back as the year 1827, and having other objects besides the encouragement of fine art. Thus its composition, as might be expected, is not specially artistic, and the management of the Autumn exhibition is only one among several public duties entrusted to the care of a body of gentlemen who are, in fact, the proprietors of the building. Here, therefore, the labours of selection and arrangement are entirely in the hands of laymen, and it is not a little interesting to observe the manner in which their duties are discharged. On the whole it must be admitted that the result of the experiment is satisfactory. Such faults as may be found are not grave, and the visitor has at least to admit a marked and even liberal encouragement of the kind of art which is generally assumed to possess but few elements of popular attraction. This is a fact of some importance, because it has sometimes been urged, by way of objection to the admission of laymen, that serious art would be in danger of neglect, but here we find a body entirely composed of laymen, and the result, whatever other defects it may disclose, at least serves as a practical contradiction to the common theory.

According to what has already been said it will be seen that the contents of the galleries divide themselves into two classes. We have, in the first place, a miscellaneous collection of pictures intended to represent the general art-product of the time, and among these works there are, as a

matter of course, very many which have already appeared upon the walls of Burlington House. To secure the more important of the Academy pictures is, in fact, one of the main objects of those who have the conduct of these autumn exhibitions, both at Manchester and Liverpool, and it must be confessed that here Liverpool bears away the palm. But the inferiority of Manchester in this respect can only be regarded as of local importance, for to the ordinary visitor, who has already made himself familiar with the contents of Burlington House, there is more interest in the sight and consideration of fresh material. At Manchester, for instance, we find, in place of some of the known popular works of the year, several examples that have never before been exhibited, and others that are said to have sought unsuccessfully the suffrages of the Academy Council. In the first class may be mentioned a large decorative picture by Mr. Armstrong, now the property of Mr. Eustace Smith. The subject of the composition—a single female figure draped in blue and white—has already been briefly described in the ACADEMY, and the general scheme of the painting may be judged from the fact that the work has been executed as a companion to the *Girl Watching a Tortoise*, exhibited in the Academy two years ago. With so much that is admirable in the choice and arrangement of delicate colouring, it is to be regretted that the drawing should so constantly fail to do justice to the artist's conception. In several parts of the figure, and especially about the neck and head, the outlines are hard and expressionless, and their effect is to take away that sense of delicate and unconscious grace that should belong to the expression of a motive so simple and spontaneous as Mr. Armstrong has chosen for his figure. But if we can forget the imperfections of the draughtsmanship there is ample ground for satisfaction in the careful composition of fresh and fair colouring. Mr. Armstrong has the rare gift of being able to subdue his scheme of colour to any required strength without sacrificing the impression of purity. He never fouls his tints: and he has besides so safe a sense of what is right for the general effect of his work that he is able to introduce a quantity of rich and elaborate detail without danger to the result. Here, for instance, the eye travels over the varied material of the picture with a sense of entire satisfaction and security, and the impression of vivacity that somewhat fails in the central figure is almost recovered in the beautiful life of growing things—the white arms relieved against the marble steps, the delicately-drawn wallflowers, and the silver foliage of the olive that encircles the maiden's head.

From this picture, which has only lately been finished, we may pass to Mr. Bownall's *Sleeping Beauty*, another interesting feature of the exhibition, and none the less welcome here because, according to report, it has been rejected at Burlington House. Mr. Bownall has striven with undoubted courage and simplicity of spirit to give artistic shape to the beauty of an individual legend, and he has so far justified his experiment as to have produced a picture with many beauties of its own. But we shall indicate what seems to us to be the principal defect of the work in saying that it appeals to us more as an illustration than as a design of independent discovery. We do not feel in its presence that the legend has taken new birth in the forms appropriate to art, but rather that by a process which has left its mark upon the result some portion of the literary beauty of the theme has been translated into the dialect of the painter. And this, we venture to think, is an impression that no painting ought to leave, for it is only by making the spectator forget that the subject could find a different or a fuller utterance that the artist is able to justify his choice. The failure, in fact, implies something inappropriate in material or something insufficient in resource, and the picture

wins our attention not by its own beauty but by recalling the beauty of another art. But in spite of this essential defect there are parts of the design and individual passages of colour that make a truly artistic appeal. The male figure has an undeniable grace and force of drawing, while in the treatment of the tangled growth of leaf and flower in the foreground there is evidence of a true command of natural beauty. Besides these two pictures the gallery also contains two very interesting examples by Mr. Watts, the one a single male figure, entitled *Esau*, the other a version of the legend of Ariadne. These pictures have been lent to the exhibition by Mr. Rickards, a gentleman who is fortunate in the possession of a large and varied collection of Mr. Watts's works. Among paintings that have already appeared at Burlington House may be mentioned the large landscape called *Toilers of the Field*, by Mr. Aumonier, two Italian pictures by Mr. Keeley Halswelle, a study of lions by Mr. Briton Riviere, *The Crofter's Team*, by Mr. Farquharson, and *Rustling Leaves*, by Mr. H. W. B. Davis. There is also a very interesting oil-sketch by Mr. Poynter for his picture of *Atalanta's Race*.

But the series of works that give to the exhibition its special character are the paintings and drawings of the Manchester School of Artists. These present a certain unity of character and method very interesting to observe, and proving that the artists of Manchester are making an independent effort based upon principles deliberately chosen. The most noteworthy examples of their art are to be found in the department of landscape, and here the teaching of the modern French school of landscapists has evidently exercised a very powerful influence. The works of Mr. Anderson Hague, Mr. Bancroft, and Mr. Somerset, though distinguished by strongly-marked individual qualities, have in common a certain sobriety of colouring and an attention to the truths of tone that are rare among other painters of the English school. For the studious suppression of all the bright and positive tints of nature a critic like M. Taine could not be long in discovering a sufficient explanation in the character of the neighbouring landscape, and certainly there would seem to be little in the neighbourhood of Manchester itself which could tempt the artist to the employment of a more brilliant scheme of colour. Of the three painters mentioned the first presents the most extreme expression of the foreign influence. His pictures, in fact, approach very closely in their manner to the pictures of the most extreme school in Paris, and are designed merely to render the relation of masses, without any attempt to realise the strength of local tint or the details of natural form. Mr. Bancroft paints in a stronger and more masculine style, and there is one picture from his hand that would in any exhibition deserve attention for the broad and yet refined truth of its execution.

Among the water-colours the works of Mr. Sheffield and Mr. Wade hold their place as examples of what the school is able to achieve.

J. COMYNS CARR.

NOTES AND NEWS.

WE have received a catalogue of a "Loan-Exhibition of Pictures and Works of Art, City Hall, Hong Kong, July 1876," Mr. H. B. Gibb being the chairman of committee, and Mr. J. B. Coughtrie the secretary. The principal feature of the collection was a display of the works of George Chinnery, an artist who lived many years in the colony, and died there in May 1852. As "the encouragement of European art" is put forward as the primary object of the committee, we are not surprised to find Oriental works practically nowhere in the catalogue: there is one specimen by "Japanese pupil of Wirgman," apparently unworthy of bearing his own proper name in European company. Works by Pyne, Leslie, Lawrence, Doré, Anthony, Wilkie, Lewis, Naftel, and Cox, were contributed,

with many to which less recognisable names are appended; the total number was 255. A brief memoir of Chinnery sets forth that he was one of the emigrants from this country in consequence of the abortive rebellion of Lord Edward Fitzgerald, and was particularly expert at sketching the scenery round Macao, with groups of natives and animals. He was born in January 1774, and went to India in 1802, and to China in 1825.

THE Photographic Society opened their annual exhibition to the public on September 9, at the gallery of the Water-Colour Society; it will remain open till November 14. The contributions number 350. Among the specimens which particularly caught our attention we may name:—Manns, *Views in Gibraltar*, remarkably clear, stopping short of being "cutting;" Woodbury Company, *Penha Castle, Cintra*, unusually large; J. E. Millais, Esq.; *Reproduction of Engravings*, singularly finished and illusive; Autotype Company, *Major-General Sir H. De Bathe*, a striking full-length; *Studies by Mrs. Cameron, printed in Autotype from negatives from paper positives, the original negatives having been destroyed*—*The Foolish Virgins, The Angel in the House*, &c.; *Romeo and Juliet, after Madox-Brown's design*; *Copies from Red-Chalk Drawings by Shields* (not "from pictures," as per catalogue); Harrison, *Vues dans la Forêt de Fontainebleau*—trees leafless and leafy; Billing, *A Life-Boat, from Henry Moore's painting*; Faulkner and Co., *Friends and Companions* (dogs); Mrs. Payne, *Flowers arranged and photographed*.

THE silver medal of the Hartley Institution, Southampton, has been awarded by the adjudicator, G. Leslie, Esq., R.A., to the following artists in open competition for works exhibited at Southampton:—G. S. Deacon, London, and R. P. Staples, London, for landscapes in oil; and Martin Snape, Portsmouth, for water-colour drawings. Several medals were also awarded in limited competition to local artists. Walter Marsh, a student in the Scientific Department of the same institution, has recently been awarded by the Science and Art Department the first place among successful candidates for exhibitions at the Royal School of Mines.

THE title of Sir Noel Paton's latest picture is *The Good Shepherd*, and it is intended as a companion picture to *The Man of Sorrows*, painted about a year ago. The picture is an upright canvas, and represents in the foreground of a landscape composed principally of rugged mountains the Saviour standing, His left hand holding a shepherd's crook, while His right arm grasps a lamb which He has rescued from the thorny twigs at His feet, the scratches from which are visible in its bleeding limbs. The Shepherd looks down on the extricated lamb with tender pity, such as He would feel in gazing on a human soul that had been rescued from the snares of a sinful world. While perhaps rather conventional in treatment, in the garments of red and blue in which Christ is draped, and the halo round the head, the picture, alike in the feeling with which it is imbued, the admirable drawing of the Saviour's figure, and the careful workmanship throughout, worthily upholds the artist's high reputation.

THERE has just been placed in the Tuileries Gardens, in the Great Avenue, opposite the Pavillon de Marsan, a bronze group of *Mercury Carrying off Psyche*, by John de Vries, a Dutch sculptor born at the Hague about 1550. This group had previously stood in the Louvre, in the Salle Michel Ange, but had been removed to give place to the Stenga portico of Cremona. Executed about 1590 by order of the Emperor Rodolph II., this group, with its companion, decorated the Hradschin Court at Prague, whence they were both carried to Stockholm, on the taking of that city by the Swedes. It followed Queen Christina

to France, who gave it to the Marquis de Sablé, and successively passed into the possession of Louvois, Colbert and his son, M. de Seignelay, who gave it to Louis XIV. In 1790 it was at Marly, then at St. Cloud, and the Louvre, whence it was removed to the Tuileries Gardens.

SOME interesting Druidical remains have been discovered in France, in the territory of Benqué and Billière, on a mountain that separates the valleys of Oueil and Larboust, not far from Luchon. They consist of several groups of cromlechs united by lines of menhirs, with each principal cromlech surrounded by several smaller circles. Excavations have already been begun, but not as yet carried very far. Several vases containing ashes and fragments of human bones have, however, been found in the interior of the smaller circles.

A STATUE to General Lafayette was inaugurated with great ceremony in New York on September 6. This monument was originally to have been placed in Central Park, but for some reason it has ultimately been erected in Union Square, one of the finest quarters of New York, where the monument to Washington bears it company. The pedestal on which the statue to Lafayette was raised was a gift from the French inhabitants of the United States. It consists of a fine block of American granite, with an ornamental design engraved upon it, and the single inscription "Lafayette."

A COMPREHENSIVE and amusing essay on the "Iconography of Voltaire," by M. Gustave Desnoiresterres, is continued in last week's number of *L'Art*. A page of ludicrous portrait-sketches and caricatures, and several other portraits, by Huber, are given, representing Voltaire with every possible expression of countenance, and in all varieties of costume and *coiffure*, from the elaborately-curved wig of the sneering philosopher to the lank tresses of a lean saint who looks as if he had just come out of a cold bath.

A FULL-PAGE engraving of the picture by M. Joseph Sylvestre which won the Prix du Salon this year, *Lucote essaye en présence de Néron le poison préparé pour Britannicus*, is given in last week's number of *L'Art*.

THE Austrian Government have decided not to take any official part in the French Exhibition of 1878.

THE Belgian Société Internationale des Aquafortistes, a society which was founded about two years ago, under the presidency of the Countess of Flanders and Sir Savile Lumley, the English minister, both accomplished etchers, seems to have had already considerable influence upon the cultivation of the etcher's art in Belgium, where hitherto it has been but little practised. An exhibition organised by this society was opened at the beginning of this month in the rooms of the Cercle Artistique et Littéraire de Bruxelles, in which Belgian artists occupy a distinguished place, although a great many eminent etchers of other nationalities have contributed. France, especially, is represented by several of her greatest workers in this branch of art, while England, among other contributors, boasts of Mr. Seymour Haden, an artist who is generally admitted to have excelled all competitors at this exhibition. This is the first exhibition of the kind that has been held in Belgium. It was opened in person by the King and Queen of the Belgians, to whom Sir Savile Lumley presented a short address.

A SGRAFFITO frieze, 182 ells in length, has recently been placed along the outside wall of the old Royal Stables, in the Augustusstrasse, at Dresden. It is the work of the German painter Wilhelm Walthert, and represents the various Princes of Saxony, from Konrad the Great to the late King Albert and his brother George, moving along, presumably through the ages, in triumphal procession.

A NEW illustrated art-journal, entitled *L'Actualité*, has just been brought out in Brussels under the editorship of the well-known art-critic, M. Camille Lemonnier.

IF the large collection of Roman sling-bolts half of which was purchased some time ago by the Berlin Museum really consists almost entirely of forgeries, then the Berlin Museum is very fortunate in having had to do with so honourable a firm as that of Rollin and Feuermann, of Paris, by whom it now appears the purchase has been annulled, and the sling-bolts taken back from Berlin. The authorities on such matters in Paris still maintain the genuineness of the collection. But to have got rid of what they agree was a bad bargain is not so satisfactory to all German scholars as it is to Professor Mommsen, on whose recommendation the purchase had been made; and accordingly he has become the victim of much vituperation, to which he now replies by a short account of the whole proceeding in the last number of *Im neuen Reich*. These bolts, it should be stated, have stamped inscriptions consisting mostly of names of Roman generals, or bearing upon some campaign. When, therefore, the collection was offered for sale to the Berlin Museum, it was naturally referred to Professor Mommsen, the highest authority on Latin epigraphy. He, prejudiced by the high reputation of the Paris firm, as well as by the assurances of the bolts having been declared genuine by a number of recognised authorities who had examined them in Paris, recommended the purchase. He confessed to have had so little previous experience of this class of antiquities that he did not see what good he could do by a personal inspection of them. A considerable number of them had been engraved and published by Desjardins, and judging from them he was of opinion that the collection was a genuine one. The bolts arrived in Berlin, were examined minutely by Dr. Zangemeister, and declared genuine, Mommsen, who had only seen them hurriedly, reserving his full consent till further knowledge of this class of objects was acquired. Afterwards a second series of these bolts was sent from Paris for sale, which on being examined by Zangemeister were declared to be nearly all forgeries. By the light gained from these, the former series was again inspected and to a great extent also condemned. This result was communicated to the Paris firm, who, as we have said, cancelled the previous purchase and withdrew the whole collection.

IN the *Portfolio* of this month, under the head of "Technical Notes," the editor makes known to his readers the result of his "Experiments on a Restricted Palette." "The doctrine that the use of few pigments is a great help to an artist in the attainment of good colouring—a doctrine which has been professed by Reynolds, Etty, and many other distinguished painters"—led Mr. Hamerton some years ago, it seems, to institute "a series of experiments, having for their special object to ascertain which pigments were best worth retaining if a very few were to be used." The fullest palette ever used by Reynolds, we are told, consisted only of white, orpiment, yellow ochre, lake, carmine, ultramarine, blue-black, and black; when he used other pigments he left out some of these. But Mr. Hamerton allows one other colour—vermilion—on his restricted palette, which is composed as follows:—white, pale cadmium yellow, yellow ochre, vermilion, rose madder, ultramarine, emerald oxide of chromium, vandyke brown, black. With these seven colours, with the addition of black and white, every hue in the world, he considers, may be imitated closely enough for all purposes of art. The tints may not always perhaps be as bright as in the originals, but, for young artists especially, this deficiency in brightness is a safeguard against glare and discord. The only other important article of the number is the continuation of the Life of Turner, which is now brought to the year 1802, when he was made full

Academician. He took no pains to gain this promotion, and would not even, according to usage, thank the electors for having chosen him, but for the next fifty years he was only absent three times from the Academy Exhibitions. An etching by Lalauze from Bronzino's *Portrait of a Lady*, in the National Gallery, and another, by Ernest George, of *An Old Windmill on the Outskirts of Bruges*, with two etchings from sketches by Turner, form the illustrations.

La Beauté des Femmes dans la littérature et dans l'Art du XII^e au XVI^e siècle is the title of a large octavo volume by M. J. Houdoy just published in Paris. In literature undoubtedly, even in the early Middle Ages, this beauty was acknowledged, though it was generally regarded as a snare, but it requires a very spiritual imagination to recognise it in the art of the Byzantine period. Mariolatry, however, did much even then to soften the harshness of asceticism. M. Houdoy shows the gradually-awakening perception of the beauty of the human form in the art of the fourteenth and fifteenth centuries, until its final glorification under the influence of the Renaissance.

A NATIONAL subscription has just been opened by the French journal *L'Art* for the foundation and organisation of a Museum of the Decorative Arts in Paris, after the model of our South Kensington Museum. "Twenty years ago," it is stated in the prospectus, "the superiority of France was uncontested in all the applications of art to industry." But now the "situation has changed," and France begins to tremble, not only for her artistic glory, but also for her trade in artistic commodities. It is a question, it appears, of several hundred millions of francs a year, for, according to the statistics recently given by the Minister of Commerce, the exportation of all products of artistic industry has greatly decreased of late in France, while that of other rival nations, especially England, is rapidly increasing. Under these circumstances, "Que faut-il faire," demands *L'Art*, "pour reprendre notre supériorité?" and answers the question by saying that France must do as England has done, and found a South Kensington Museum. Whether South Kensington is really to be credited with all the satisfactory results which France attributes to it, and whether the foundation of a similar museum in France will be attended with the same success, are matters open perhaps to doubt; but it is not to be denied that it has done very much to facilitate artistic education, and to foster a taste for art in this country, and thus has naturally had considerable influence in the surprising development of our artistic industries that has taken place within the last twenty years. The Union Centrale des Beaux-Arts, of whose efforts we have before given some account, has been working for a long time with the same object, but with much smaller means, and therefore, as might be expected, with far less noticeable results. It is hoped, however, that the proposed Musée des Arts Décoratifs will prove a sort of complement to its endeavours, by facilitating the study of *chefs d'œuvre*, and models of every kind, and especially by combating a system of routine instruction which has proved extremely pernicious to the free growth of art in France. Unlike South Kensington, it is not proposed that the Government shall be asked to lend any aid in the formation or support of the French museum. It is to be entirely a matter of private enterprise:—"1^o. Parce qu'il est plus digne de savoir faire ses affaires soi-même. 2^o. Parce que l'intérêt du pays tout entier est en jeu. 3^o. Parce que le temps presse et que pour atteindre promptement le but, il faut surtout n'avoir pas à passer par la filière administrative." It is confidently hoped that the projected museum will be *un fait accompli* in 1878, and will prove one of the great attractions at the grand *fête* of Art and Industry then to be held in Paris. At present, however, it must be owned that to undazzled eyes the subscription-list does not seem to point to such a speedy result.

THE STAGE.

MR. GILBERT'S NEW DRAMA.

IF *Broken Hearts* owed something to *The Tempest*, the latest piece of Mr. Gilbert's owes as much to *Silas Marner*. Mr. Gilbert has, of course, intended to admit his obligations, and has avowed that "an incident in the first act was suggested" by the great little novel of George Eliot. In reality, however, it is much more than an incident: it is a character and a dramatic situation. Nearly all that makes Daniel Druce interesting—certainly all that would have made him original—is in George Eliot's work. The poetical conception is wholly hers, and the analysis of an exceptional character and an exceptional experience. And when at the end of the first act the playwright parts company with the poet, it is to resume the track beaten many times before by skilled but uninspired brethren.

The scene of *Daniel Druce, Blacksmith*, is laid in the middle of the seventeenth century: the first act, which is in truth a prologue, taking place after the battle of Worcester, and the second and third about the first year of the Restoration. We are first in a ruined hut of the Norfolk coast, where the talk of men who afterwards play no part in the story makes us aware that the shrunken wretch we see before us—Daniel Druce—has elsewhere led a worthier life than his present one of half-witted seeming poverty, concealing a hoard of gold. His wife has been taken from him by some unknown lover, and he, embittered, has sought motive for living in the slow accumulation of a hidden store. To him there enter presently two soldiers, Colonel and Serjeant. The Republican troops are upon them, and they demand shelter. He fears them and goes out to betray them. In his absence they discover his gold, and on his return with the men who are to entrap them, the two adventurers are found to have departed; they are even now safely putting off from the shore, and they have taken Daniel Druce's money, and have left him a child sleeping on the floor. There are words with the child, to say that the money shall be sent back, and the child must be cared for. The curtain falls on the hysterical rejoicings of this lonely heart that a human affection is now again possible to him.

Thus far, George Eliot in conception—Mr. Gilbert only in arrangement and disposition. Henceforth the work is wholly that of the dramatist, and a sound and healthy British play, skilfully ordered, takes the place of the keener, deeper, and more spiritual study of character in the by-ways of Humanity. Fourteen years have passed. Daniel Druce, who had abandoned his own craft to be a miser, has resumed the work at the blacksmith's forge, and the child has got to be a woman and is the sole care of the old man. Her playmate, now a merchant sailor, comes back, and is in love with her. The old man knows that the time of his own supremacy is over, and this he feels naturally, hardly seeking to dispute the growing claim of the other. But there is a second claimant for the trim Puritan damsel. One Reuben Haines, steward to Sir Jasper Combe, aspires to her. Sir Jasper visits the place, and in the story which he tells to the old blacksmith, Daniel Druce suspects him to be the father of the girl. No one else has cause to suspect it until a trinket that had belonged to Dorothy's mother is given by her to her chosen lover, Geoffrey Wynyard, in exchange for a locket, his gift to her; and this trinket is recognised as the one which Sir Jasper Combe left on his child the night that he resigned her to a stranger's care on the Norfolk coast fourteen years ago. It is now Geoffrey Wynyard's business to turn aside suspicion from the father and steward that Dorothy may indeed be the girl, and, in hearing of the astonished Dorothy herself and the indignant Daniel Druce, he claims the sailor's privilege of a score of loves, and declares himself to have got

the trinket from some far-away mistress. Druce would pursue him with the hammer of his craft, but Dorothy intercedes. Geoffrey Wynyard has, indeed, been false to her, but she forgives him. The father may do likewise. And, because it is only the end of the second act, the over-chivalrous young man goes out without any sign of determined effort at explanation. He could not, it is true, have explained wholly, since that would have been to divulge to the old man the bitter secret of the girl's birth and his impending loss; but he might have explained partially. In our grey world of everyday the lover would have righted himself—would have somehow contrived to—but Mr. Gilbert, in his romantic moments, which do not come very often, breathes a higher atmosphere than ours, and so it is natural that the young man should in silence stride valiantly away.

But his close keeping of the secret is not, after all, of effect. And in the third act Sir Jasper comes to ask for his child. The old man has known that the asking must be, and has sat pathetically by the fire "waiting for the blow to fall." Yet first there has been temptation for him. The fantastic steward, erewhile a serjeant, full of quips and conceits, would have kept the knowledge from his master had Druce allowed him to marry the girl—had the girl been willing to marry him. For a time Druce has hesitated. He has even told the girl that though she loves Wynyard it is Reuben Haines who loves her. And Reuben has addressed her, but with conceits so ample and extravagant that she recoils from him as from a lunatic, and the braggart and fantastic, shrewd through his nonsense, has gone out to tell his master the truth at last, and the blow will fall on the old blacksmith. Wynyard arrives, having apparently thought better of that too chivalrous departure, and, now that the old man knows from the steward that the girl will have to be given up, he makes it clear to Druce that he had but sought to protect her in his inventions about the derivation of the trinket from some girl from over sea. Sir Jasper, in his flight that night long ago, had thought of his own safety before that of his child, but, having not so much as a mote to take out of his own eye, he proceeds at once, in his interview with the blacksmith, to take the beam out of his brother's. That is, Daniel Druce is to be reproved and reviled because he has never sought, of his own motion, to restore the girl to her father, whoever that father might be. Now, of course, there is fine opportunity for Daniel Druce's retort, and the not altogether unselfish gentleman feels his position bitterly.

The girl will not come to her father at all gladly when it is his convenience to ask for her. Having his share of instinctive affection, he would like indeed to compel her, though he hardly dares to do so; and now he discovers that the old blacksmith is none other than the man whose wife he had taken, before the scene of the prologue. It is made clear to us at last that the Colonel had brought unwittingly, to the hut by the coast, the child to its father. Remorse seizes him, and telling Daniel Druce to think of him as the man who had wrought him his worst wrong on the saddest day of his life, he shuts the door behind him, and leaves the old man and the girl, and the chivalrous young sailor to happiness as long as it may be.

Here, of course, is a very good subject, and much skilled treatment. Improbabilities occur now and then; the main coincidence is itself of very exceptional kind; but, on the whole, the intrigue is carefully elaborated, and conducted with a practised hand. It is a healthy, if a painful drama. Mr. Gilbert has been charged before now with morbid suspicions of the goodness of the best part of the world—with a cynicism carried beyond the limit of literary or stage effectiveness, to a point disagreeable and unwhole-

some. The charge cannot be made here—cannot even be insinuated. Such force as this play does not owe to George Eliot's conception, it owes to a union of healthy feeling with wit and the playwright's practised ability. Healthy feeling is within Mr. Gilbert's capacity. You judge Mr. Gilbert by a high standard, and find, indeed, on judging him by that, that his work when it is gravelacks the spontaneous and individual elements which make poems that live. Save, perhaps, in *Sweethearts*, his work is an affair of ingredients, an affair of compounding. Mr. Gilbert is a skilful dispenser. And here it is healthy feeling, so much; wit, so much; knowledge of the stage, so much; yes and alas! improbability, so much. The whole makes a fair compound. The compound succeeds. But really we are not to mistake this skilled work for a poet's.

At realisation of individual character there is only one prolonged attempt, and that is in the case of the fantastic who utters Mr. Gilbert's more spontaneous things, and is provided with curious and harmonious witticisms at every turn. Elsewhere the dialogue is unequal: the old-world nature of it being here too much emphasised, and there entirely dropped and lapsing into the common talk of our day—never, as in Thackeray's *Esmond*, finely and equally sustained. Thus Daniel Druce, though he talks tersely, talks only our own talk when it is best, and Dorothy's quaintness of expression is tiresomely overdone. And she gains no character through it, for it contains none. No doubt it is far easier to seize upon some quickly-discernible mannerism and to give that to a person of the drama than to conceive a character and embody it. It is easier to be quaint than naïve. Dorothy, in every act and deed, is a familiar and conventional character. She expresses, in quaint words, common thoughts.

The actors have probably felt that the piece is in its aims, if not in its achievements, above the everyday play, whether comic drama or melodrama. Mr. Gilbert puts sound workmanship very often, and the actors have on the whole good reason to do their best for an accepted dramatist who, at all events, is not resting upon past successes. The interpreters of the work have, too, been carefully chosen, and of the prominent ones, whom we shall need to name, there is not one quite without special qualification for the part he assumes. Even Mr. Odell, if he is extravagant as the word-splitting serjeant and steward, has gifts of eccentricity, and intelligence in eccentricity, not to be denied. Mr. Howe throws more feeling and humour than is his wont into the part of the Colonel. Mr. Forbes Robertson is excellently picturesque and manly as the true lover. In the love-scene of the second act he gives a pretty forecast into the lives of the two in a very pretty and sympathetic and imaginative way; and Miss Marion Terry, albeit at some crucial points wanting any approach to abandonment in emotion, is generally simple, demure, and pleasant. Art in a high sense, and the impulse behind the art of the artist, the young lady has yet to learn. Her utterance has acquired point; but, like her facial expression, is wanting now in intensity. Mr. Hermann Vezin fills with a perfect capability the character of the Blacksmith. The author, though giving him a capital part, has not contrived for him many of the situations that bring down a house, and a certain imaginative element that might well have been in the play, had the lines of George Eliot's conception been more closely followed, is not there, and Mr. Vezin, strongest in imaginative moments like the best of the *Man o' Airie*, suffers rather for the want of them. But the reality of the character he represents he slowly and surely impresses upon you; bringing to bear upon his task an art that has no need to assert itself by exceptional display.

FREDERICK WEDMORE.

MISS HELEN BARRY has come to the Court Theatre with a four-act play entitled *Ethel's Re-*

venge, in which she is supported by Miss Fanny Hughes, Miss Florence Roberts, Miss Rebecca Isaacs, Mr. Edmund Leathes, and that excellent actor, Mr. Charles Kelly—in all, a sufficient company. The programme at the theatre includes also a comedieta by a popular novelist—Mr. James Payn, the author of *Lost Sir Massingberd*, and other stories full of intrigue and liveliness. Mr. Hare will before long return to the theatre, and Miss Ellen Terry has been announced to take the place of Miss Kendal, who will be at the Prince of Wales's.

THE Gaiety promises us an amusing revival this morning, for its first morning representation of the present season. Mr. Byron is to appear in his original character in *Not such a Fool as He Looks*.

THE Queen's Theatre opens to-day with some performances of Shaksperian drama in which Mr. Phelps and some less celebrated actors are announced to take part.

ON Monday Miss Jennie Lee returned to the Globe Theatre after an absence of several months, and resumed her part of Jo in Mr. Burnett's version of *Bleak House*.

ON Wednesday Mr. John Clarke was to begin an engagement at the Strand Theatre in the familiar pieces in which, as we chronicled last week, he has been appearing recently at the Haymarket. The talent of the American comic actor is exceedingly well adapted, as has been proved already, for that part of a Strand audience which goes into the theatre not only for the burlesque properly so called.

THE nuisance of stage delay on a first night reached its height on Monday evening at the Haymarket, where the curtain rose on the main piece of the evening—Mr. Gilbert's new drama which is discussed above—nearly three-quarters of an hour after the time advertised for beginning. It is true that the audience was not left to silence all that time, nor to the mercies of a band with sepulchral groans from below the stage of the theatre. A *lever de rideau* was proceeding, but it is safe to say that many of the visitors who attend on a first night to watch the new play anxiously, were of opinion that the *lever de rideau* might, with advantage, have been shortened, and that others could have wished it suppressed. Nine o'clock is far too late an hour for an important play to commence its first representation, nor is the hour made more reasonable on an occasion when most of the occupants of stalls and boxes had already been seated an hour, and most of the occupants of pit and gallery about two hours, before the play began which they all had come to see.

Le Mariage de Figaro has been performed at the Odéon on a night when it was advisable not to represent the *Danicheff*. The performance had excellent elements, but was somewhat without *ensemble*. The barber and the waiting-maid were played respectively by Porel and Mdlle. Léonide Leblanc. Porel played with all his habitual carefulness and good intention, but without impetuosity and effervescence. In this respect Mdlle. Leblanc resembled him. Her Suzanne is not the *piquante* creation of the Augustine Brohan of sixteen years ago. Her voice, soft but never biting, and her calm face, by no means mark her out as a model Suzanne. But her efforts were considerable and artistic, and some French playgoers are not unwilling to consider her as a comedian, though it is difficult for them to forget that for eight or ten years her rôle has chiefly been that of *jolie femme*. We need not all of us have the same difficulty, for three or four years ago—before the appearance of Desclée in London—we saw her act *Frou-frou* here, and she acted it with a good deal of taste and knowledge, as well as with the grace which the French playgoer has been content to perceive. At the Odéon Mdlle. Fassy played Cherubino, and the useful Mdlle. Crosnier Marcelline. Talien was hardly well placed as the Count Almaviva.

M. SCHEURING, the publisher of Lyons, has just brought out a volume called *Galerie historique de la Comédie Française pour servir de complément à la Troupe de Talma*. It deals, therefore, with artists of the leading theatre, such as Mdlle. Georges, Samson, Beauvallet, and Rachel. M. Sarcey, the critic, has not prepared this volume, but he is preparing a volume meant to be a sequel to it—a series of studies on the living artists of the Comédie Française. Etchings by Gaucherel will illustrate M. Sarcey's publication.

MUSIC.

MR. CARL ROSA'S ENGLISH OPERA COMPANY.

LAST Monday Mr. Carl Rosa commenced his second season of English opera in London. Instead of the Princess's, he has this year chosen the Lyceum Theatre as the field of his operations. The change is likely to be a judicious one, as the house is admirably suited for such performances as those which he contemplates, and its situation is so central as to render it easily accessible from all parts of London. With the exception of Miss Rose Hersee, all the principal members of last year's company are again engaged, while various new comers are announced to appear in the course of the season.

Mr. Rosa could not possibly have selected a better work for his opening night than Cherubini's *Water-Carrier* (*Les Deux Journées*), the production of which was one of the special features of his last season. As the work was noticed in detail in these columns last year (ACADEMY, November 6, 1875), only a few remarks will be needed as to Monday's performance. Excepting that Miss Rose Hersee as Marcellina was replaced by Miss Julia Gaylord—who, it may said in passing, was a most admirable representative of the part—and that the not very important rôle of Angelina was sung by Miss L. Graham, the cast was the same as last year's. The fine performance of the overture proved at once that Mr. Rosa's orchestra is quite as efficient as hitherto; and the rendering of the whole opera was characterised by that finish of *ensemble* which from an artistic point of view is so far more satisfactory than the appearance of any number of mere "stars." It is no exaggeration to say that there was not one weak point in the whole performance; and it is very evident that Mr. Rosa intends to sustain the reputation which he so well earned last year. In one respect it was impossible not to wish that our audiences would take a lesson from Bayreuth. On the first appearance of Mdlle. Torriani and Mr. Santley, the performance was for the time stopped to greet these favourites of the public with a round of applause. That they fairly deserved all the recognition they received I should be the last to deny; but when the lady stops to pick up a bouquet, and Mr. Santley has to put down his water-pails and come forward to bow, there is an end of all illusion. Would that our public would have the sense to reserve all such demonstrations for the close of the act!

On Tuesday night Benedict's *Lily of Killarney* was given, with alterations and additions specially made by the composer for Mr. Rosa's company. The performance of this very charming, though somewhat unequal, opera was no less excellent than that of the previous evening. In one respect it showed off the company to even greater advantage than Cherubini's work; because, being founded, as many of our readers will be aware, on Mr. Dion Boucicault's play, *The Colleen Bawn*, it contains a much larger number of good acting parts than the *Water Carrier*. It is in the uniform excellence with which these were filled that the great strength of Mr. Rosa's company appears. As on the night before, there was literally not one unsatisfactory point. All were so good that it seems almost invidious to single out any for special praise; yet it would

be unfair not to refer in detail to at least some of the performers. Giving the place of honour to the ladies, Miss Julia Gaylord should first be mentioned. This young lady was heard last year in this company, but at that time she mostly played only secondary parts. Her impersonation of Eily O'Connor on Tuesday proved that she is fully qualified to fill more important characters. Not only did she sing with much charm, but her acting was also excellent—alike free from coldness and exaggeration. The Ann Chute of Miss Josephine Yorke (whose successful *début* last season our readers will remember) and the Mrs. Cregan of Miss Lucy Franklin were both thoroughly satisfactory, while Mrs. Aynsley Cook, in the small part of Sheelah, gave us one of those finished pieces of character-acting in which this talented artist so much excels. Of the gentlemen Mr. Santley, as Danny Mann, and Mr. Charles Lyall, as Miles-na-Coppaleen, carried off the honours, the genuine comic humour of the latter being particularly rich, while Mr. Santley, both as a singer and actor, was "in his best form." Mr. F. C. Packard, who took the part of Hardress Cregan, sang admirably throughout; but as an actor he has still much to learn, his performance being at present somewhat constrained and conventional. It must not be forgotten, however, that he is as yet somewhat new to the stage, and it is quite probable that with more experience he will gain that freedom and confidence which will place his acting on a par with his singing. The smaller parts of Corrigan, Father Tom, O'Moore, and Hyland were well filled by Messrs. Ludwig, Aynsley Cook, Arthur Howell, and Muller; and both chorus and orchestra were most excellent. The additions made to the music by the composer are, with one or two trifling exceptions, all in the third act, and consist of a new *scena* for Mr. Santley, some very effective ballet-music, and a new finale founded upon the song "Eily Mavourneen." Though displaying throughout the skill of a thorough musician, these additions will, excepting the finale, hardly rank among the best portions of the opera.

The performance of the *Sonnambula* on Wednesday introduced to a London audience two new members of Mr. Rosa's troupe. These were Mdle. Ida Corani (Amina), and Mr. J. W. Turner (Elvino). The lady was heard in our concert-rooms last season, but has not, I believe, appeared previously on the stage—at least in this country. Her *début* must, on the whole, be pronounced a decided success. She possesses a voice of extensive compass and great flexibility, and though her shake is somewhat imperfect and her intonation in the more florid passages not always unimpeachable, her singing was perfectly excellent, especially in *cantabile* passages, and her acting showed an intelligence which with more experience on the stage is likely to produce the best results. Mr. Turner is the fortunate possessor of one of the finest tenor voices I have heard for many years. His singing was good throughout, in spite of a slightly nasal tendency occasionally perceptible, but which with care he will easily overcome. He is a decided acquisition to Mr. Rosa's company. His "Still so gently o'er me stealing" was encored, and repeated greatly to the detriment of the dramatic effect, as the Amina to whom he was singing had left the stage at the close of the air, and did not reappear. Mr. Rosa has done so much for English opera that it would be well if he would set his face resolutely against encores. He is quite strong enough to do so; and he may depend upon receiving the warm support of the press as well as of the more intelligent portion of his audience. In a lyrical opera like Bellini's the matter is of course of less consequence than it would be in more purely dramatic music; but the encore system is radically bad; and Mr. Rosa would earn the hearty thanks of true lovers of art if he would resolutely refuse to accede to the demand. The remaining parts of the opera were excellently filled as follows:—Count Rodolpho,

Mr. Celli; Alessio, Mr. Arthur Howell; the Notary, Mr. Muller (whose make-up, whether intentionally or otherwise, bore a most ludicrous resemblance to Dr. Kenealy); Lisa, Miss L. Graham; and Dame Teresa, Mrs. Aynsley Cook. Special mention must be made of the Lisa of Miss L. Graham, the most important part in which that young lady has yet appeared, in which she displayed a dramatic capacity of no common order. She is likely to make a most excellent actress. The band and chorus were as irreproachable as on previous evenings, the chorus being particularly good.

The remaining performances of the week have been the *Water Carrier* (Thursday) and *Faust* (Friday). This evening the *Lily of Killarney* is to be repeated, and in the course of next week Adolphe Adam's *Giralda* is to be produced for the first time in England. The attendance has been most excellent, money being refused at the doors; and it is earnestly to be hoped that Mr. Rosa's enterprise will receive all the support which it most thoroughly deserves. EBENEZER PROUT.

THE 153rd meeting of the Three Choirs, which has taken place at Hereford this week, derives its chief interest from the fact that a return has been made to the customary character of the festivals. The general dissatisfaction which was caused last year by the action of the authorities at Worcester in substituting what was little more than an ordinary Cathedral service for the usual performance of oratorios and other sacred music will be fresh in the memory of our readers. The Dean and Chapter of Hereford have, we think, been well advised in reverting to the form of festival which has been so successful in past years. Musically the present meeting has been chiefly remarkable for the entire absence of novelty in the programmes, which has rendered it needless to report it in detail. It will be sufficient to give the list of works brought forward. On Tuesday morning *Elijah* was given; on Tuesday evening Handel's *Samson* (considerably abridged), and the first part of the *Creation*; on Wednesday morning Spohr's *Last Judgment* and Mendelssohn's *Hymn of Praise*; on Thursday morning Mr. J. F. Barnett's oratorio *The Raising of Lazarus* and Gounod's "Cecilian" Mass; on Friday morning the *Messiah*; while on Wednesday and Thursday evenings miscellaneous concerts took place in the Shire Hall, and on Friday evening a chamber concert was given, the programme of which included among other works Mendelssohn's *Otello* for strings. The list of vocalists advertised comprised the names of Mdle. Titiens, Miss Bertha Griffiths, Mdme. Edith Wynne, Mdme. Trebelli-Bettini, Miss Enriquez, and Messrs. Sims Reeves, W. H. Cummings, Lewis Thomas, and Maybrick. Mr. Done (of Worcester) presided at the organ; Mr. C. H. Lloyd (of Gloucester) accompanied on the piano; and the organist of Hereford Cathedral, Mr. Townshend Smith, was the conductor.

THE proceedings of the second session of the Musical Association have recently been published, and it is very satisfactory to find that on the whole they are far more practical in their character than those of last year. During the earlier meetings of the Association there was, without any disrespect to the members be it said, somewhat too much tendency to air merely theoretical crotchets, and to discuss points which, however interesting to the mathematician, could be of no possible use to a musician engaged in the active exercise of his profession. The proceedings of the past session have shown a decided improvement in this respect, as will be evident from the following list of the papers read at the meetings:—"On Musical Criticism," by Mr. Charles Salaman; "On the Graphic Method of Representing Musical Intervals, with Illustrations of the Construction of the Musical Scale," by Dr. W. Pole; "Considerations on the History of Ecclesiastical Music in Western Europe," by Sir Frederick Ouseley; "On Kettledrums," by Mr. V. de Pontigny;

"On some Points in the received Method of writing an Orchestral Score," by Prof. W. H. Monk; "On Standards of Musical Pitch," by Dr. Stone; "On our Perception of the Direction of a Source of Sound," by Lord Rayleigh; "On the Musical Inventions and Discoveries of the late Sir Charles Wheatstone," by Prof. W. Grylls Adams; and "On Medical Science in Relation to the Voice as a Musical Instrument," by Dr. Lennox Browne.

M. MICHOT, the tenor singer, who had not been heard in Paris for seven years, made his reappearance last week at the Théâtre Lyrique, as Huon in *Oberon*.

M. TOURNIÉ, the French tenor who sang at the Gaiety last year with such success, is at present engaged at the Théâtre de la Monnaie, Brussels, where he made his first appearance on the 3rd inst., as Raoul in the *Huguenots*.

THE third series of the Bayreuth performances is spoken of in the German papers as being no less successful than the preceding. The house was crowded, and the King of Bavaria attended the whole series. At the close of the work Wagner came forward in answer to a general summons, and in a few words expressed his thanks to the audience and the performers. After his speech the curtain was raised, and the whole of the actors, with Hans Richter, the conductor, in their midst, were seen grouped on the stage.

It is now definitely announced that the *Wal-küre* is to be produced at Berlin. The cast, which is unusually strong, will be as follows: Siegmund, Herr Niemann; Sieglinde, Frau Mallinger; Wotan, Herr Betz; Fricka, Frä. M. Brandt; Brünnhilde, Frau Voggenhuber.

THE *Neue Zeitschrift für Musik* states that some French composers intend trying conclusions with Wagner upon his own ground. M. Ernest Reyer is engaged upon a *Sigurd*, the subject of which is similar to that of the third part of the *Ring des Nibelungen*; and M. Louis Gallet has written a libretto, *Tristan*, which M. Jondrières will set to music, with the view of surpassing Wagner's *Tristan und Isolde*.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Dutch in the Arctic Seas. By Samuel Richard Van Campen, Author of "Holland's Silver Feast." In Two Vols., with Illustrations, Maps, and Appendix. Vol. I. A Dutch Arctic Expedition and Route. (London: Trübner & Co., 1876.)

THE enthusiasm of a historian who devotes a volume of 300 pages to a mere introduction to his subject cannot be doubted. His patriotism may, however, be questioned, for it requires more interest in the old Dutch and their doings than we fancy survives in these days to stimulate any ordinary reader to work through such an extended series of prefatory remarks as Mr. Van Campen has thought necessary to introduce his *magnus opus*. What he means to do in his second volume we can only guess. But, judging from his first now before us, he proposes to describe the achievements of the Dutch in Spitzbergen, Novai Zemlai, and other portions of the Arctic Regions. No doubt Barents, Heemskerk, and Hendrik Hudson were famous men in their day and generation, and are well worthy of being chronicled. But their achievements are already well known to us, and, as the Hakluyt Society intends republishing Barents' voyage, we shall really soon be in possession of all that is valuable in the story of the doughty deeds of these sons of mud-begotten Holland. Mr. Van Campen seems, however, to think otherwise, and though we may doubt the necessity of his volume, that is a question for himself and his publishers, not for us: our duty is to enquire how he has performed his task. After a very careful examination of his first volume, and with every desire to look in the kindest spirit on the labours of one whose singleness of purpose and laborious enthusiasm no one can doubt, we confess to have been disappointed with the result. The book is made up of a long *résumé* of the familiar arguments for a Polar expedition so repeatedly published in a variety of other works, and therefore cannot, so far as we see, tend in any way to the fitting of a Dutch expedition. Possibly the work may also have been published in the language of Holland, but as there is no hint in the voluminous preface that this is the case, we must presume that it is intended to stimulate the Dutch people to equip a Dutch expedition by English arguments for an English expedition, published in the English language, by one who is neither a seaman, a geographer, nor an Arctic voyager. At the outset this is unfortunate. Then there is absolutely nothing new in the work; it is a mere compilation, written in a very dull style, and in English that is often obscure, and some-

times even barely grammatical. This would be scarcely worthy of note had Mr. Van Campen been a Hollander in any other sense than that in which Mr. Rip Van Winkle was. He is (apparently) an American of Dutch descent, who is justly proud of the deeds of his ancestors, and anxious that all the world should share in his pride. The materials in the volume are by no means judiciously selected. Chapter after chapter is filled with very irrelevant matter, on all manner of things except the Dutch in the Arctic Seas, and with quotations from the most familiar books. This is all the more unnecessary, since the volume cannot surely be intended for popular reading, but for the study of geographers, to whom the quoted authorities are perfectly familiar. There is scarcely a quotation from, or even a reference to, a Dutch or German volume, and none to the much less read "authorities" in Swedish and Danish, or to any memoir or paper in English, which could not be well known to everyone in the slightest degree interested in Arctic research. We have something about the Phœnicians; a little about Christopher Columbus; a great deal about Captain Silas Bent, of the United States of America, and his guesses about the Gulf Stream; a word or two about Dr. Livingstone, and something about his "discoverer"; numerous references to Drs. Kane and Hayes, and the doings of Captain Hall, his authority being the rubbishy volume—"edited by E. Vale Blako"—which no geographer has ever received as trustworthy; and last of all we find a little about the Dutch in the Arctic Seas, with the promise of a great deal more by-and-by. It does not appear that Mr. Van Campen has ever been in the Arctic regions, or has anything more than a mere literary acquaintance with his subject. He cannot, therefore, be expected to be able to exercise a very judicious eclecticism in his choice of "authorities," and some of the writers he cites are of sufficiently dubious weight. All, however, are fish to Mr. Van Campen's net. It is enough for anybody to say anything which suits his purpose, to be quoted by him. If a stone suits him he builds it into his wall, without much caring what its quality is. To him *Putnam's Magazine* is as good as *Petermann's Mittheilungen* (to which, however, he resorts less frequently than would have been desirable to the completeness of his subject), and the quotations in *Nature* and other journals are apparently, in the eyes of the historian of the Arctic-going Dutchmen, as valuable as the original papers, which he has not quoted, in the *Geographical Magazine* and the *Transactions* of the Geographical Society. This leads us to remark that Mr. Van Campen does not seem to be at all well acquainted with the literature of his subject. When the Arctic Expedition under Captain Nares was being fitted out, two committees—respectively of the Royal Society and of the Royal Geographical Society—drew up two Manuals for the use of the expedition. Both of these contain many papers very valuable for Mr. Van Campen's purpose, but neither of them is quoted. Indeed, it does not appear that he is even acquainted with the latter, for, when quoting Mr. Clements Markham's excellent Memoir on the Eskimo, he cites it as it originally appeared

in the *Journal* of the Royal Geographical Society, and not in its improved form in the *Arctic Papers for the Expedition of 1875*. He does not appear to know of the volume (with several supplements) on Arctic subjects issued by the Hydrographer of the United States Naval Department, or of the various volumes on Kane's and Hayes's observations published by the Smithsonian Institution. It seems extraordinary for any one to write in 1876 on the Eskimo, and not avail himself of Dr. Rink's well-known volumes on that people. But our historian does not. True, he devotes two lines to the learned Dane's researches, but these lines are second-hand from Mr. MacGahan. "Professor" Geikie—though it is not the Murchisonian professor but his brother, Mr. James Geikie, who is referred to—is quoted on Glacial Phenomena, in a passage (the erroneous academical title included) also seemingly from MacGahan. Dr. James Croll is also quoted, but it is his papers in the *Philosophical Magazine* which are cited—not his more recent and authoritative *Climate and Time*. To any man writing of the Dutch in the Arctic Seas, Moritz Lindeman's *Die Arktische Fischerei der Deutschen Seestadt, 1620-1868*, is simply indispensable, containing, as it does, numerous particulars about the Hollanders also; but equally do we vainly search Mr. Van Campen's volume for a reference to it. We might multiply this list to an endless extent, but these examples may suffice. We can only conclude that the omission is due to ignorance, for, as we have said, Mr. Van Campen is by no means very chary as to whom he quotes, and is profuse in the superlatives he applies in praise of all and sundry whose brains (or otherwise) he borrows. Moreover, as the works omitted are all authoritative and necessary to his purpose, we can only say, as the other alternative, that if the compiler of *The Dutch in the Arctic Seas* is acquainted with the books in question, then he has shown great deficiency of judgment in not using them. But one of the most extraordinary omissions we have noted in reading this book is the following. At p. xxxiv. (preface), he laments that the *chef-d'œuvre* of Hendrik Tollens, the Dutch poet, *On the Wintering of the Hollanders in Nova Zembla*; though translated into French by Clavareau (from which translation a motto is taken for this volume), is not available in an English version. More than once Mr. Van Campen refers to this, so that it is well to let him know that there was an English translation of the poem in question, published as late as 1874 by Mr. William Young. There are also various errors throughout the volume. For instance, it is absurd to state that "a naval officer was sent to Baffin's Bay in the spring of 1873, fortunately resulting in the rescuing of the *Polaris*." Commander Markham went out in the *Active* on his own account: he was sent by no one, and would be the last person in the world to claim the credit of rescuing the *Polaris*' crew. The men were picked up by the whaler on board of which that gallant young officer was a passenger, and if Mr. Van Campen had carefully read Commander Markham's book he would have seen that this would have happened whether he had been

on board or not. He continually misuses the Russian word "Polynia" as meaning the "Open Polar Sea," while in reality it only means the open places in the sea—the "Ström holes" of the Danes. The "Open Polar Sea," moreover, seems to be one of Mr. Van Campen's foibles, though when quoting Morton and Kane's fanciful remarks about their supposed discovery he should, at the same time, have modified them by the searching and exhaustive criticism by which Dr. Rink demolished that pretty picture. He advocates the Spitzbergen route for a Polar expedition as the best, in spite of the fact that the highest English authorities had, after considering the whole question, fixed upon Smith's Sound as the best. He quotes M. Malte-Brun's *Trois Projets d'Exploration au Pôle-Nord* as authoritative, but the Secretary of the French Geographical Society can really know quite as little about the Arctic regions and "the best routes to the Pole" as Mr. Van Campen himself.

In fact, what Mr. Van Campen calls the "Archimedean word of the North Pole" seems to his mind the aim and end of all Arctic exploration. The exploration of the 2,500,000 square miles of the Polar Basin is to him a small matter compared with the almost puerile ambition of standing on a spot where the sun's declination is equal to its altitude—for that after all is what the North Pole is. No doubt the Arctic Expedition will aim at getting to the Pole, but that is not the sole object for which the country sent them out, nor the only thing they desire. This would be reducing a scientific expedition to about the level of the Cockney tourist who climbs a mountain solely for the sake of boasting that he "has done it." Does not the writer in Bledsoe's *Southern Review*, quoted at p. 91, mistake sea-ice for icebergs? We think he does. Is it quite certain (p. 96) that Hall did get with his ship to lat. 82° 16' N.? We had always been of the belief that it was in no way settled among geographers what exact latitude he reached. Mr. Van Campen is, very properly, a "lover of his country and his country's friends," but he is very apt to make both laughed at when he professes his belief in the beery old Dutch skipper's yarn about sailing "beyond the Pole itself." We would advise him to restrain his credulity for the "endorsement" of more probable tales, for if he credits these stories then all we can say is that his faith is of the kind by which mountains are removed! The German East Greenland Expedition (for an account of which Mr. Van Campen does not quote *Die Deutsche Nordpolarfahrt*, but gives as a reference Geikie's *Life of Murchison*!) he is very indignant at "partial annalists" by "poetical latitude" describing as superior in adventure to Kane's or Barents' expeditions. Might we inform our patriotic author that the words he quotes are not those of a "partial annalist" allowing himself "poetical latitude," but of the very prosaic writer of these lines, who used them in a review of the English translation of the narrative of the German Expedition in the *ACADEMY*? Moreover, he is hardened enough still to think that they were strictly true, and that no one knowing anything of the history of the expeditions

in question could have any other opinion. At p. 213 Greenland and Spitzbergen are described as "rich in flora," and a few lines lower down the flora of Greenland is characterised as "one of the most poverty-stricken on the globe." Mr. Van Campen's remarks on the probable Natural History results of an Arctic expedition (p. 215), chiefly derived from Mr. Markham's *Threshold of the Unknown Region*, contain expressions which clearly demonstrate that as a "scientist" he does not excel. At one place he advocates the necessity of naval discipline in an Arctic expedition, and in another place (p. 179) he will not wait "for Admiralties to take the initiative in these things." We hope the Dutch may explore the "Spitzbergen route to the Pole," though all we can say is that if, as Mr. Van Campen imagines, this expedition is to make a conjunction with Captain Nares, it had better be quick. There is a map affixed to the volume, though we have not been able to find the "illustrations" promised on the title-page. The map is apparently by the author, and would certainly bear improvement. It shows Dr. Petermann's hypothesis of Greenland, stretching over the Pole and uniting with Wrangell's (Kellet's) Land. In the want of any exact knowledge this may be true, though the facts as at present known tend to the belief that Greenland will be found to end in an archipelago of ice-bound islands. Surely, however, it is a slip of the pencil that has made the limit of drift-ice extend not only south of what are called the "Faeroe" Islands, but to Orkney itself. Again, Godhavn instead of being in lat. 69° 14', as it should be, is marked as in lat. 65°, and there are some other similar errors, which mar the geographical value of an otherwise very neatly executed map. How is it also that Franz Josef Fjord is not marked when the name of such an unimportant point of land as Cape Grivet is given? In the chronological list of Arctic voyages in the appendix there are several errors in dates, and some entries of voyages which were no voyages at all. We cannot spare space to point out these, though we trust that by the time Mr. Van Campen's second volume is ready he will have seen fit to compress the present one into half the space, and publish both in one. It is full of "padding" of the most unnecessary kind, which only weights the book without improving it. We regret to have been under the necessity of saying so many unkind things of a work written apparently with the best intentions by an industrious man who has really the subject of Arctic Exploration at heart. It is always an ungracious thing to speak in uncomplimentary terms of what is well meant; but the literature of this subject is getting so extensive that unless a writer has something new to tell, or at least can tell the old in an attractive and accurate manner, the addition of one more "Arctic book" to our libraries does more harm than good. For these reasons, viz., that his treatise is superfluous, and in this country, at least, has no *raison d'être*, we have felt compelled most unwillingly to tell Mr. Van Campen that he has spent much labour on what profiteth not.

ROBERT BROWN.

Thrift. By Samuel Smiles, Author of "Character," "Self-Help," &c. (London: John Murray, 1875.)

IN Mr. Smiles' latest book he gives us something more than an illustrative treatise on that homely and excellent virtue, thrift. He deals with some of the leading social questions of the day, such as Co-operation and Association. He sketches the salutary movement, unsparingly satirises the feminine follies of fashionable circles, and lastly concludes with an admirable essay on what may be called the aesthetics of common life. We all know what a book from Mr. Smiles is sure to be, anecdotal, practical, and abounding in good sense and every-day wisdom, a book that is sure to entertain the old and instruct the young. Whether thrift, any more than etiquette, swimming, or the art of conversation can be taught in a book is a doubtful matter, but there is no doubt that young people may reap some benefit from Mr. Smiles' goodnatured sermons.

The charge of extravagance brought in this volume against almost all classes of English society is borne out by daily experience; but our author is certainly a little too hard upon English workmen when comparing them with their French neighbours. He quotes against them the following speech recently made by Mr. Roebuck at a public meeting, which is very much of a piece with Marie Antoinette's famous blunder about the tarts. "Why should not a working man," asks Mr. Roebuck, "be like a gentleman? Why should not his house be like my house? When I go home from my labour, what do I find? I find a cheerful wife, an elegant educated woman. I have a daughter; she is the same. Why should not you find the same happy influences at home? Why should not working men, after enjoying their dinners and thanking God for what they have got, turn their attention to intellectual enjoyment instead of going out to get drunk at the nearest pot-house?" When there are, indeed, intellectual enjoyments provided for the working man's Sunday we may well put such a query, but not till then. While our museums, picture-galleries, public libraries, public gardens, and other places of instruction and amusement are shut on the only resting day in the week, it can be little matter of surprise that the working man spends alike his money and his leisure amiss. We all know that in France and in Germany, where improvidence and drunkenness are found to nothing like the same extent as in England, it is not so, and the intellectual pleasures provided for the poor are largely enjoyed by both sexes. Again, Mr. Smiles quotes Mr. Brassey, who, in his *Work and Wages*, states that when the Paris and Rouen railway works were commenced, the contractors endeavoured to introduce a system by which the workmen were to be paid once a fortnight; but very soon after operations had begun, the Frenchmen requested that the pay might take place only once a month. Nothing, he writes, could be a greater test with the directors of the respectability of a working man than being able to go without his pay for a month; which is quite true. Whereupon Mr. Smiles breaks out despairingly—"It is difficult to account for the waste and extravagance of

working people. It must be the remnant of the original savage. It must be a survival." Why is this survival found in England and not in France? Firstly, because the French working classes are trained to economical habits from their earliest years; secondly, because they have a constant example of thrift in the middle and upper ranks; thirdly, because they are a propertied and a privileged class, and thus have every inducement for that excessive laboriousness and frugality so wanting here. The French peasant possesses the soil, and is able to enrich his family by the fruit of his labours; and that the artisans and mechanics are given to economical habits also is evidenced by the twenty-eight millions sterling invested by the working classes of France last year. Again, there is every reason to believe that example has something to do with it. All those who know French domestic life intimately are aware that, except perhaps among the rich mercantile class, extravagance and waste are absolutely unknown. The workman's wife, who has spent some years in domestic service, has thus had the best possible training, has learned, in fact, to make the best of everything and waste nothing. In English households, on the contrary, lavishness is the rule and economy the exception, the mistress rarely knows anything about household matters whatever, and when Mr. Smiles makes the homely witticism, "Those whom God has joined in matrimony, ill-cooked joints and ill-boiled potatoes have very often put asunder," he does not fall far short of the truth. "The fair sex," he adds, "are sometimes very acute in what concerns themselves. They keep a tight hand on their dressmakers and milliners. They can tell to a thread when a flounce is too narrow or a tuck too deep. Have they been taught to cook? Is it not a fact that in this country cooking is one of the lost or undiscovered arts?" To which melancholy question, all conscientious readers must answer, yes. Elsewhere Mr. Smiles is severer still upon his countrywomen. In his opinion there was never such a rage for dress and finery in England as now. It rivals the corrupt and debauched age of Louis XV. A delirium of fashion exists, and women are ranked by what they wear and not by what they are. Wordsworth once described the perfect woman nobly planned. "Where will you find the perfect woman now?" asks Mr. Smiles, and in language which we hope is an exaggeration of actual facts, he portrays what we find instead. He can, however, do ample justice to the sex: witness his mention of Priscilla Wakefield, the founder of the first Savings' Bank; also of Martha Crossley, so instrumental in making the family fortunes of the public-spirited firm of John Crossley and Sons. Among other good things in an excellent treatise on hygiene and domestic economy, is a generous and well-merited tribute to that indefatigable worker for the public good, Edwin Chadwick. All who have followed Mr. Chadwick's laborious and single-minded career will agree with these concluding sentences of Mr. Smiles' brief biographical sketch. "Edwin Chadwick has thus proved himself to be one of the most useful and practical of public benefactors. He deserves to be ranked with Clarkson or Howard. His labours have been equally

salutary; some will say that they have been much more so in their results."

M. BETHAM-EDWARDS.

Journal of Commodore Goodenough, R.N., C.B., C.M.G. 1873-5. Edited, with a Memoir, by his Widow. With Maps, steel-engraved Portrait, and Woodcuts. (London: Henry S. King & Co., 1876.)

It is well that Mrs. Goodenough has not shrunk, through any misgiving as to her fitness for the task, from this editorial tribute to the memory of her heroic husband. If it is of interest to the British navy, to British pluck, enterprise, uprightness, and simple faith, that a seed of such men as James Graham Goodenough should not fail out of the land, then it was her bounden duty to tell, in her natural, unadorned, loving words, the true tale of his life and death. And no carping disparagement is likely to diminish the force of a lesson, wholesome and imitable throughout, from the cradle to the grave, because, happily, Mrs. Goodenough's estimate is affirmed from step to step by dispassionate witnesses, and by the corroborations of official confidence, which rarely follows uninterruptedly services that are other than of high desert. A son of a Dean of Wells and former Head-Master of Westminster, young Goodenough imbibed traditions of discipline and duty fostered by parental example, and found in the mimic world of Westminster School both a first field for resistance of evil, and an opportunity for the manliness which ripened into heroism. At fourteen, he passed into the Royal Navy, and joined the *Collingwood* at Spithead in July, 1844. Fortunate in his captain and naval instructor, as well as in the amount of various service which the ship's crew saw in the next four years, the young midshipman by 1848 had added much to his stock of seamanship, knowledge of modern languages, and general and professional reading. A conscientious, earnest lad, or, as his first captain's certificate ran, "an officer of promise," in a nursery of such officers, he passed as a lieutenant in 1851, and from that time to the end of his career escaped the enforced inaction which is so often complained of in a naval life, by volunteering for any professional work, and, when none such offered, by finding other work, more or less kindred and congenial, for his hand to do. His first command was that of the *Goshawk* gunboat, in 1856, at the close of the Russian war; but, this being soon paid off, he was sent to the China station, as first lieutenant to the *Raleigh*, upon the wreck of which, near Macao, described in pp. 16-9, he found occupation in the command of a small hired steamer, and in the vigorous repression of petty Chinese piracy. His letters home, even thus early, exhibit a keen observation, a steadfast purpose, and a high and noble ideal of duty, and the little trait noted in a letter by a former seaman of the *Raleigh*, that in those days some of the crew gave him the sobriquet of "Holy Joe," speaks volumes for his constraining sense of religion, guiding him in his daily life, and making him severe in his standard of self-discipline and at the same time considerate, true, and

just towards his fellow men and officers. Up to 1861, when he had risen to the rank of Commander, his voyages and services seem to have been chiefly in the Chinese seas and rivers; but that he had approved himself to the Admiralty as an intelligent officer is obvious from his being named for a special mission to North America, for information with regard to the ships and guns in use there. He returned to England in 1864, and married in the same year; but this did not prevent or diminish his usefulness to his country and her naval service. When not flag-captain, in the *Victoria*, of the Mediterranean squadron (1864-6), or, in the *Minotaur*, of the Channel Fleet, we find him undertaking the post of Relief Fund Distributor to the starving French about Sedan, and taking part, in letters and essays, in the improvement of the education of naval officers. Such manifest devotion to the theory as well as practice of his profession could not but mark him out, not simply as a naval officer of promise, but as a thinker of broad views and aims, meet for such professional work as that of a naval *attaché* to the maritime Courts of Europe, to report on their navies; and, later on, for the mixed task of reporting upon and consummating, in connexion with Mr. Layard, and in command of the *Pearl*, the annexation of the Fiji Islands in 1875. It helps one to form a true impression of the man to read his letters about this annexation, and to see how he regards it as a positive duty, by way of securing a central station for Polynesia. While this work is going on, the Commodore takes a residence at Sydney for his wife and children, and continues to sail backwards and forwards between Sydney, Melbourne, Tasmania, the Fiji Islands, and thereabouts, till the question was settled in October, 1874. His journals, ever instructive and teeming with information as to the geology, social progress, productiveness, and general prospects of each port and colony, exhibit everywhere an activity of mind, and a force of purpose actuated by a tender and truth-telling conscience—so that he ever holds himself accountable to his Maker for his treatment, not only of his brethren in Christianity, but also of the heathen and the savage. Good at all field sports—as witness the zest with which he gives an account of a kangaroo hunt (p. 260), and what Sir Hercules Robinson said of his "goodness across country" (p. 135)—his energy was not less conspicuous in subduing self and setting an example, so that both his seamen and the natives learned from him that here was one who practised what he inculcated, unlike (we fear) the general phenomena of English influence in our colonies and their outskirts. While, too, his lot was cast more or less at Sydney, it is curious to note the interest he took in quickening the colonial interest in our earlier discoverers, as witness his part in unveiling the statue of Captain Cook. Here is a single extract from his journal to show of what his mind was full, while ashore at Melbourne, in July, 1874:—

"Dined at the club. I spoke of the connexion of the colonies with the navy; called the early naval men heroes, and said: 'I, who should not, speak of these things, because I want you to do your part in producing heroic qualities for the

naval service—to expect them—to look for them—and by looking for them to evoke them.' Darwin-like!" (p. 242).

At the opening of the eighth chapter, which details the *last cruise*—the climax of that career of wholesome and noble example which must have borne fruit a hundred-fold in our colonies—Commodore Goodenough's character is limned with an accurate and appreciative touch, and we see the seeds of that heroism, that "thinking no evil," which to some extent led to his premature death. Circumstances, we are told, strengthened unduly his belief in the native friendliness, and, though he would not go to Nukapu, the scene of Bishop Patteson's death, he ventured the special risk of landing in Carlisle Bay, where an English man-of-war had been attacked a few months before, adding first a few words to a letter to his wife in case of accident. This was the occasion of a second martyrdom in the islands of the Santa Cruz group, a sacrifice in its details and ending as striking as the Bishop's, though the Commodore's lingering for some days under the effects of tetanus and of the poisoned arrow gave him longer space for exhibiting the collected front which a thoroughly-furnished Christian sailor can oppose to the "last enemy." It is quite needless to recapitulate the touching particulars of his parting with his men and officers—his womanly tenderness, his prepared mind and heart, his keen fear of sinning against God, even in the pains of death, his noble looking-forward to the future conversion of his ignorant murderers.

"As to those poor natives—don't think about them and what they have done. It is not worth while: they couldn't know right from wrong. Perhaps some twenty or thirty years hence, when some good Christian has settled among them and taught them, something may be learned about it" (p. 154).

What a contrast must such a naval officer, so living and so dying, present to those who know the British Navy of the past by the contrary examples, which Smollett, for instance, depicted in his novels! What a testimony to the change wrought even within the last generation by the spread and influence of a more real faith. It is not an "inane munus" which Commodore Goodenough's widow has dedicated, as the labour of her own love, to the memory of her heroic husband's work and influence. He being dead will yet speak in this unadorned and loving memorial.

JAMES DAVIES.

La Troisième Invasion, Juillet, 1870—Mars, 1871. Par Eugène Véron. Première partie, de la Déclaration de la Guerre à la Capitulation de Sedan, avec 77 eaux-fortes, par A. Lançon. (Paris: Ballue, 1876.)

This magnificent publication belongs to the category of sumptuous editions which, while apparently doing all they can to make the merits of an author visible, in reality place great obstacles in the way of his just recognition. The great price restrains the sale to comparatively few copies; the cumbrous form makes the work inconvenient to read; and the excessive luxury of paper and print rather distracts our attention from literary qualities than enhances our appreciation of

them. So far from envying M. Véron his splendid material accompaniments we are rather disposed to offer him our respectful condolence on account of them. He has written, or half written, an unusually good piece of military history; but few will read it, because the printer, paper-maker, and artist have done all in their power to overload the unfortunate author. The habit of purchasing magnificent *livres de luxe* has gone to such lengths in France during the last few years that there seems hardly any limit to this respectable form of extravagance, and the high prices asked are so far from discouraging the wealthy public that the costliest works are said to be the safest investment for their publishers. Before saying much about M. Véron's literary merits, which, as we have just hinted, are considerable, let us attempt a description of his book in its material aspects. The volume is not bound, but issued in a big portfolio, and it is printed in very big type, which has been cut and cast specially for this publication. The paper is very thick *papier vélin*, a sort of paper which takes the impression of type with extraordinary clearness. The printing of this work, which has been executed by M. Claye, certainly does great credit to French workmen; we have never met with anything nearer to ideally absolute perfection, the letters are so bold, the ink so black, and the press-work so accurately equal. There are 217 pages of letterpress and seventy-seven illustrations, the latter being etchings printed on *papier de Hollande*. The ordinary edition consists of 500 copies, such as we have described, the price being 16*l.* for the two volumes of the completed work; but there are fifty copies with the letterpress on Dutch paper and the etchings (early proofs) on Japanese, the price of these proof-copies being 32*l.* The consequence of all this material luxury is that people will consider the work a thing to be looked at rather than a book to be read. They will give some attention to the etchings, they will admire the fine typography, but few will read the text. Very generally the neglect of mere letterpress is just, but M. Véron's work is much better than mere letterpress. It is a clear and readable narrative of the events of the war, beginning with a consideration of its causes, and leading down to the investment of Paris. The first volume ends with the establishment of the Government of National Defence, the second will describe the siege of Paris, the efforts of France to succour the capital, and the events which led to the peace. The merits of the writer are a strict attention to ascertainable facts and the absence of that foolish kind of patriotism which falsifies one's views of everything with which patriotic feelings can be concerned. It is difficult, if not impossible, for any military historian to attain strict accuracy in all matters of detail, but it is a great merit in him simply to wish to tell the truth. The difficulty of being accurate in military narratives is due to the great scale of the operations, of which no single witness, however trustworthy, can see more than a very small portion, and also to the danger in which the observer is generally placed, and especially the great risk of being shot for a spy. As

for computations of results which the author has not seen, such as the number of men killed on both sides in combats at different places, it may be doubted whether they can be trustworthy in any history, however carefully the writer may have sifted the materials in his possession. Who counted the killed and wounded? It is well known that commanding officers do not think it necessary to tell the exact truth, especially when losses have been heavy. Even the number of living men engaged on either side is always very variously estimated, and the length of time during which a position is maintained is not so certain as it seems. The writer of this article was reading lately a French narrative of one of the minor combats in the Franco-German War in which it was asserted that the Prussians retreated after fighting two hours; the fact being that he himself saw the Prussian artillery still in position, and with renewed activity, six hours after the commencement of the combat, and the Prussians were so far from retreating that they stayed in the place till the next morning. In this case the estimates of numbers were so various that most of them must necessarily have been erroneous. Even the official narratives were contradicted by eye-witnesses on points of the greatest importance. The difficulty of writing a true narrative in the face of so much contradictory evidence was very strongly felt by those who had actually seen the fight; but writers at a distance narrated it in the most decided manner, without being embarrassed by facts of which they were happily ignorant. After this little piece of experience, we became perfectly sceptical as to the detail of military history generally, except when there is a great deal of concurrent yet independent evidence. Let any one who has lived through a war try to ascertain the exact truth about what took place at any given time within a radius of six miles from his own person, and he will perceive the difficulties of military historians and their critics. The historians generally write confidently enough. They know the exact numbers of killed and wounded as if they had counted them; they know exactly what was taking place in all parts of the country at the same date; they even know what was passing in the minds of different commanders. Then come the critics who know differently, because they have read some other narrative. The best helper to the truth is the professional war-correspondent, and, as there were several good war-correspondents in the campaign of 1870, we have certainly a better chance of accurate information concerning it than our forefathers could have about the great conflicts of the past.

M. Véron's general opinions on the war are these. He believes that it was determined upon by Prussia long before France declared it, but that Bismarck was clever enough to arrange matters so that France should bear the odium of breaking the peace. The history of the days which immediately preceded the rupture requires the most careful attention, in order not to confound what was known then with what everybody knew a little later. Much depended upon the behaviour of King William

to the French ambassador, and much more upon what was believed about it than upon the behaviour itself. The popular belief in France was simply that the King had given the ambassador a kick. Bismarck in a note indirectly transmitted to the French Government encouraged the idea that there had been some intentional discourtesy towards M. Benedetti. M. Véron does justice to King William, and infers from the Chancellor's action in the matter that he was anxious to exasperate France.

"La note était blessante, d'autant plus blessante qu'elle était inexacte. Le roi n'avait pas refusé de recevoir notre ambassadeur le 13 Juillet, puisqu'il n'y avait pas eu ce jour-là de demande d'audience. Loin de là, dès qu'il avait reçu la renonciation personnelle du prince Léopold, il s'était empressé d'en informer par un de ses aides-de-camp l'ambassadeur français, et c'était cet empressement que M. de Bismarck transformait en un procédé insultant. En admettant même que le roi ait été bien aise, par cet empressement, de se délivrer de la perspective d'une nouvelle entrevue avec M. Benedetti—ce qui est très possible et même probable—il n'en reste pas moins que le fait, considéré en lui-même, est susceptible d'une interprétation absolument contraire à celle qu'on lui a donnée, et cela suffit pour qu'on n'ait pas le droit d'y voir une insulte à la nation française."

M. Véron believes that the defeat of France was a certainty from the commencement, and that it was due to the improved military organisation of Prussia rather than to any decline in the French organisation, which had always been very defective at the beginning of a contest, though without serious results so long as other countries were equally unready. M. Véron's analysis of the French army at the outbreak of the war shows a lawyer-like faculty for getting at the real truth after brushing away a tissue of fictions, and it is much to be regretted, for the sake of France, that neither Louis Napoleon nor his Ministers had a faculty of this kind when they so much needed it. The author shows that the calculations of Louis Napoleon's Government were fallacious because they were based upon fictions, and he goes into details with a determination and a thoroughness which we certainly did not expect in a *livre de luxe* intended to be turned over in drawing-rooms. Then comes a clear, though brief, account of the Prussian system, and after that a sketch of the military plans on both sides. Each country had been scheming its "plan de campagne" for several years previously. The defects of the French project were that it could only be carried into execution under conditions which were problematic, and which when it came to actual practice were not realised, and also that it did not provide for the contingency of a defeat, which, as it turned out, was the result that actually happened. The French plan was never executed, never even carried through its earlier stages. The French army found itself in a muddle of confusion from the very beginning, and from that the activity of the enemy never left it time to recover. We have not space to follow M. Véron into his details, many of which are extremely interesting and curious. His account of the march of Mac Mahon's army (if such a disorderly body of men can be called an army) from Châlons to Sedan reads like a prologue to certain disaster.

Everything was so wretchedly managed that the men were mutinous from sheer hunger and misery, having to lie down at night in the rain with empty stomachs. It appears that many of them left their regiments to go and shoot in the woods by the roadside, and stray bullets from the rifles of these sportsmen killed fifteen of their comrades on the road. The absurd luxury of the Emperor's establishment aggravated the rebellious disposition of the men. M. Véron tells us that waggons lumbered along for the service of the Imperial mouth which were laden with live game and live lobsters at a time when the soldiers were so badly cared for that they literally had to beg food by the way. The effects of political considerations upon the conduct of the war are depicted with much clearness, both in the case of Bazaine and in that of Napoleon III., who admitted that politics had interfered with strategy in his letter to Sir John Burgoyne. M. Véron is generally fair to the Prussians, and when he speaks with severity of their conduct, as for example at Bazeilles, he is careful to substantiate his accusations, often appealing to the evidence of the Prussian authorities themselves. In his account of the Revolution in Paris which immediately followed Sedan, M. Véron does not forget to explain the exact order in which events succeeded each other, showing that the Empire was not upset by a mob, but that the *déchéance* was really decided by the Corps Législatif when it declared that as soon as circumstances permitted the nation would be called to elect a Constituent Assembly which should "pronounce upon the form of government." The author considers that the Government of National Defence saved the honour of France by showing the world that she would not give in without resisting to the last extremity, and in this many impartial foreigners would gladly agree with him; but it is extremely unfortunate that the heroic defence of Paris should have been obscured by the mad Communal insurrection which succeeded it.

The seventy-seven etchings by M. Auguste Lançon, which are included in the same portfolio with M. Véron's text, do not illustrate it, having seldom any relation to the pages where we find them; but they illustrate the war very curiously in their own independent way. M. Lançon's principle is simply to draw the events of warfare as they appear to a man who takes part in them and sees them close at hand. The consequence is, of course, that his sketches are nearly always sketches of episodes, showing the actions or misfortunes of a few individual men. In some instances, but much more rarely, they give us the aspect of a battle-field as it would appear to a general officer surveying it from a height; but there are none of those pompous compositions which the artists of the Renaissance schools used to elaborate, and which represented the general "calme sur un cheval fougueux," in the midst of smoke and carnage. M. Véron seems, from his preface, to be under the impression that this new way of illustrating the incidents of war is a discovery of M. Lançon's. He forgets, or as a Frenchman may never have

seen, Mr. Sydney Hall's sketches for the *Graphic*, which were executed exactly on the same principle as these of M. Lançon, and with equal artistic power. The merits and defects of M. Lançon's work are both so obvious that it would scarcely be necessary to point them out to any one who had seen the plates. He can remember attitudes and details well, so that with the help of such hasty notes as he could take during the war he has been able to make a strikingly truthful series of etchings. He is especially a clever draughtsman of animals, and well able to deal with the horse wherever he finds him, either in the excitement of the cavalry charge, the fatigue of the road, or in the strange positions which succeed to violent death. M. Lançon knows all about artillery and the transport service. Hedraws carriages and their wheels well; and it is not every artist who can draw a wheel, simple as it looks. He conveys quite successfully the impression which the mind receives in war-time from seeing peaceful things cast aside in disorder—as, for instance, when you go into a school and see all the benches heaped up against one of the walls that the floor may be clear for the beds of the ambulance. M. Lançon's observation of little things, such as furniture in houses occupied by the soldiers, is often of the greatest value. He has also the most valuable gift of all, for such a task as this—namely, the power of rendering expression in the human face and body. The stoicism of some of the wounded, the simple submission of others, the anguish of some sufferers, the vacant stare of one or two from whom life is ebbing away, are given with painful truth; nor has the artist recoiled before the still more terrible task of studying the expression of corpses, for corpses *have* expression, often of the strangest. Most Englishmen remember how in Mr. Sydney Hall's sketches the dead on the battlefield held their arms in all kinds of positions, sometimes straight up like an orator in the heat of declamation, and the stiffness of death fixed them so. We find the same in M. Lançon's sketches of battle-fields, and we notice that the horses are often fixed in their last convulsion, just as if they were leaping. Throughout these etchings the artist seems wholly untouched by the pride and circumstance of war, but full of sympathy for its victims, and we should imagine that a publication of this kind might have some influence, if anything could, in favour of the pacific temper which in spite of some appearances to the contrary has been quietly gaining ground in France during the last twenty years. The beauty and elegance of military life are visible only at reviews. In war-time soldiers are generally dirty, and often really miserable in appearance, as men must be who lie down in the mud and have hardly time for necessary food and sleep. After looking through these etchings one has the impression that war is an accumulation of all imaginable hardships and horrors, and this, indeed, is the most visible characteristic of it. But in the reality these horrors are mitigated by a constant succession of odd incidents, which help wonderfully to keep up the spirits of the men, and M. Lançon, unlike Mr. Sydney Hall, seems to have been

quite insensible to the ludicrous side of military life. English people talk of French gaiety, yet there is not a single humorous face in all these etchings. They are all as serious as Scotch people on a Sabbath fast. The mixture of comedy and tragedy is difficult in art, though it happens constantly in the reality of life; but it would have added to the interest of M. Lançon's war-pictures and also to their truth. The execution of his etchings is easy and spirited, yet not of particularly fine quality in any instance; and some plates are spoiled by heavy shading, especially in the skies, which might easily have been avoided. There is a tendency, also, to black patches, which seems unfortunate. M. Lançon seems to be fond of a black patch when he can introduce it, and he does not mitigate it by necessary lights or reflections. But, notwithstanding these little defects, which strike the eye just at first but are soon forgotten in the dramatic interest of the plates, M. Lançon's work is a most valuable contribution to the authentic illustrations of the Franco-German war, and it will always be interesting—indeed, its interest is likely rather to increase than to diminish with the lapse of time, for the importance of the great conflict between France and Germany can only be appreciated in the future, when the political consequences of it shall be fully known.

P. G. HAMERTON.

A Sketch of the History of Taxes in England, from the Earliest Times to the Present Day. By Stephen Dowell. Vol. I. To the Civil War, 1642. (London: Longmans & Co., 1876.)

A HISTORY of English Taxes can hardly fail to be an interesting work, for a great part of the political history of England is but a narrative of the various expedients to which our kings resorted to raise money or to impose taxes, and the modes in which these expedients were resisted by the people. It should contain an accurate statement of the successive limitations placed upon the royal prerogative: how the Crown successively lost the right of imposing new aids, new duties, new taxes; how it endeavoured to evade the law by the device of benevolences; how this device was met by the statutes of Richard III. and the Petition of Right; how Charles attempted to revive the old prerogatives of the Crown; how James II. imposed tonnage and poundage of his own authority. In short, it should be a history of the great struggle between the Crown and the people, which, beginning with Magna Charta, was terminated by the Bill of Rights. Such a subject necessarily demands great learning, great research, and great ability, to produce a work that shall be worthy of the name of a History of English Taxes; and even at the present day, when we have histories of every possible part of our annals, there is still ample room for a good book on the subject. This we regret to say Mr. Dowell has not given us. He can hardly consider himself to be a safe guide when he gravely gives as a precedent for Mr. Lowe's match-tax the alleged payment to the Druids for the sacred fire, or when he states as one of the direct taxes levied in the

time of Boadicea a tax on the bodies of the dead.

We wholly differ from Mr. Dowell in his statement that "the fifth, sixth, seventh, eighth, ninth, and, indeed, the tenth and the first half of the eleventh century we may deal with compendiously, as presenting few features of fiscal interest." On the contrary, we regard this period as one of very great interest to the fiscal historian. True it is that the historical materials are scanty, but it is none the less true that it was from the practice of this time in levying extraordinary taxes, such as Dane-geld and Ship-geld, that our subsequent kings claimed the right to levy arbitrary taxes without the sanction of Parliament. In the old grants of the time to the Church there are exceptions frequently made from all taxes except the *trinoda necessitas*. Any History of Taxation that is worthy of the name should give, as far as it can be given, some account of what these taxes were, but Mr. Dowell, after urging upon us the great importance of the golden rule to begin at the beginning, dismisses these six centuries and a half in four pages.

A history of the taxes under the Norman kings involves an account of how the taxes were raised, and this should give us a history of the early machinery of the Court of Exchequer. Four pages are all that Mr. Dowell devotes to this branch of the subject, and these consist merely of quotations from Madox and Stubbs. We seek in vain for any account of the duties of the Justices in Eyre, of the Chancellor, of the Treasurer, of the mode in which the accounts were kept, how the sheriffs passed their accounts, how the towns accounted for the *firma burgi*. We are only referred for information to the *Dialogus de Scaccario*.

The great commutation by Henry II. of personal seisin into a money payment is, we are told, taken from the Laws of Ine, but the great distinction between the Saxon and the Angevin system is not noted: the Saxon system was a penalty, a fine for non-attendance; the Angevin system was a privilege granted by the king to his favourites.

The great instance of the poverty of the country—its inability to find the ransom of Richard I.—is but slightly touched upon: the sum required was 100,000*l.* Although to ransom the King was one of the three aids that were undoubtedly legal, yet the sum was so large that the Justiciar and Queen Eleanor seem to have considered that an attempt to raise it by an aid would be idle, and it was only after imposing an aid of 20*s.* on each knight for a tallage, hidage, and carucage, supplemented by a demand on the churches for their plate and jewels, and a tax of one-fourth of the revenues or goods of every person in the realm, that sufficient money was raised, not to pay the king's ransom, but to procure his release. If the fourth of the revenue of every person in the kingdom failed to raise such a sum as 100,000*l.*, we can imagine what the national wealth at the time must have been, and although the taxes imposed by the early kings seem very large, yet how little they really produced.

Although Mr. Dowell gives us the text of the *Confirmatio Chartarum*, he does not give

us any explanation of it. We looked with some curiosity in a History of Taxes to what the author had to say upon this most important statute—the turning-point in the history of taxation. Did it save the king's right to impose the ancient aids, and only forbid him to impose new aids and taxes without the authority of Parliament, as was afterwards so strongly urged in one of the leading cases on taxation; or did it absolutely forbid the imposition of any tax or aid, ancient or otherwise, without the consent of Parliament; and, if the former is the true view, what were the ancient aids in existence when the statute was passed? Mr. Dowell does not vouchsafe us any information on this important point. All he tells us is:—

"The following are the terms of the new articles inserted in that famous statute which Hallam, in allusion to the immunity from arbitrary taxation it secured to us, says is inadequately denominated the Confirmation of the Charters, for it added another pillar to our Constitution not less important than the great Charter itself."

Clauses 5, 6, and 7 of the statute are then given in the French and the English translation without a word of comment.

In one chapter Mr. Dowell takes us over nearly three hundred years, from the accession of Richard II. to the outbreak of the Civil War. After telling us that the period "includes a total change in the names and families, the dwellings, the arms, dress, manners, thoughts, habits, religion, and, in many respects, the food of Englishmen," he makes the following startling statement:—

"During the whole of this long period of change there was little practical alteration in our system of taxation. The fiscal history of the time is therefore easily accomplished. After a few minutes' delay at starting, to consider the memorable Poll Tax of 1380, it is a straight run all down road."

But when Mr. Dowell proceeds on his straight run he finds that there is some practical alteration. With the Tudors we meet with subsidies, which, as Mr. Dowell admits, are the commencement of our modern system of taxation; then come loans and benevolences, licences, the beginning of the excise revenue, and the great distinction between taxes raised for local and imperial purposes. In the face of such changes as these it can hardly be said that there is little practical alteration.

We have not space to follow Mr. Dowell into the details of the Poll Tax and the subsidies. What we chiefly quarrel with him for is not keeping to his subject. Why should the historian of taxes give us page after page of "general remarks" containing reflections that have nothing to do with taxation? What have the executions of Fisher, More, and Lady Salisbury to do with taxes? They seem to have some great charm for Mr. Dowell; for he tells us of the "sad scene by the block-side between the executioner and old Lady Salisbury, her grey hairs dabbled with blood;" and again, "the grey hairs of Lady Salisbury, his relative, and seventy years old." What have Fisher, Surrey, and More—who, we are told, "glue with their blood the label of tyrant to the King"—to do with the subject? what possible connexion is there between the 33 Henry VIII. c. 21—the Act which Hallam

styles as the one that made it treason in a lady who was not fitted for a picture of Diana to marry the King—from which Mr. Dowell gives a long extract, or Elizabeth's speech at Tilbury, and the history of taxation? It is true that in his preface Mr. Dowell tells us that some of his general remarks should be taken as little more than memoranda of certain points of contemporaneous national history, and that his style is lighter than that usually adopted in treating a fiscal subject; but we trust in the next volume Mr. Dowell will be not so light in his style, and will give us more history and fewer general remarks.

J. W. WILLIS BUND.

The Holy Truth; or, the Coming Reformation Universal and Eternal, because founded on Demonstrable Truth! Science and Religion Reconciled. Compiled by Hugh Junor Browne. (Arthur Hall & Co.)

Where are the Dead? or Spiritualism Explained. Third Edition. (London: Simpkin, Marshall, & Co., 1876.)

BOTH these books relate to what is called "Spiritualism," and they are likely, by their earnestness and apparent good faith, to assist in increasing a feeling, very common among educated people who have not made physical or medical science a special study, that scientific men do not deal fairly with the phenomena in question. When such men as Crookes and Wallace join the ranks of spiritualists in this country, and persons of known intelligence do so in other lands, why is it that our men of science, for the most part, stand aloof from the enquiry, and many of the most eminent proclaim their opinion that to enter upon it would be simply a waste of time? This question is frequently put, and to a certain extent there is justification for the dissatisfaction it expresses. There is undoubtedly more in the so-called spirit manifestations than science can as yet explain, and it will be impossible to carry on researches in the physiology of the nervous system without taking into account the facts presented in what are termed mediumistic conditions, clairvoyance, &c. Even the more material aspects of the subject require fresh investigation, when numbers of persons whose testimony upon ordinary subjects would be undoubtingly received as good evidence say they have seen instances of heavy tables moving without being touched or acted upon by any known physical agent. If the alleged facts are not true, their cerebral condition must be in a state well worthy of study; and when Mr. Crookes reports cases in which the weight of a body has been altered and objects moved by some force that has not been hitherto recognised, it cannot be denied that there is real ground for further enquiry.

Conceding this much on the side of the spiritualists, it must be observed on the other side, in the first place, that scientific men have not neglected the subject to the extent frequently supposed. Dr. Carpenter devoted a great deal of time to it for many years, and his recent book on *Mental Physiology* embodies the results of his investigations. Mr. G. H. Lewes did his part in the

enquiry some years ago, and many medical men have watched recent exhibitions as carefully as they could. The average result of their investigations has not been such as to encourage scientific men to consent to spend more time upon the subject until they have reason to believe that all the conditions indispensable to accuracy will be complied with on the part of the so-called spirits.

The books before us, though having every appearance of being perfectly honest statements of what their writers believe to be facts and truths, exhibit, as spiritualistic literature usually does, a marked want of scientific qualities, and a disposition to believe improbable things upon insufficient evidence. The writer of *Holy Truth* tells us he is the son of a Presbyterian clergyman, and was brought up in an orthodox creed, which he was in the habit of defending with the customary arguments. As he grew up he felt perplexed with such doctrines as the Trinity, the Incarnation, eternal damnation as the punishment for doubt, and the existence of the Devil. Spiritualism at this period seemed to him a fraud and a delusion, but he was much impressed with hearing, or fancying that he heard, in the night the voice of a friend who was ill and staying at the house of his doctor. This friend had promised that, if he died, he would come to him if possible, and prove the truth of spiritualism, and the morning after the voice was heard the doctor came to tell of his decease. Following upon this came the arrival in Australia of Mr. Charles H. Foster, the American medium, and Mr. Browne lost no time in obtaining his services. Mr. Foster made some excellent hits, and if that were all that was known about him they might have a considerable evidential value; but this medium was at one time in London, and completely failed when due precaution was taken to give him no hint of the replies the enquirers expected, or of the names they wrote down, which he pretended to read by clairvoyance. The particulars will be found cited by Dr. Carpenter, and if we put the two stories, English and Australian, together, the evidential value of this gentleman's performance is greatly reduced. Mr. Browne, however, tells us that on one occasion Mr. Foster gave him a spirit message in a language he (Mr. Foster) did not understand, but which was in the Zulu tongue, with which Mr. Browne had become acquainted in Kaffirland. Stories of this kind are very curious, and if sifted free from fraud, would seem to indicate that the brain of the enquirer influences that of the so-called medium.

While Mr. Foster was assisting in the spirit business, Mr. Browne's eldest daughter, a child eleven years old, was found to be a writing medium; and on her first exhibition of this capacity she exclaimed "Oh! I am so frightened, my hand is moving." As the power developed she not only wrote spirit messages in English, but also in Chinese and Kaffir, of which she did not understand a word. Assuming these and similar statements to be true, they would be assignable to the class in which cerebral impressions made consciously, or unconsciously—but, if consciously, forgotten—were recalled in the abnormal state, like the sounds of the Hebrew words repeated without intelligence in the

case of the servant girl mentioned by Coleridge. A child whose father knew Kaffir would be very likely to hear it, and the sight of a tea-chest might fix Chinese characters on the brain.

Mr. Browne's other children are mediumistic, and give "charming" descriptions of spirit-life, and his spirit circle had the further advantage of the presence and speeches of Shakspeare, Ben Jonson, and other notabilities; here we find something to test, as there is not a phrase or thought in the least degree Shaksperian or Jonsonian in what they are made to say. This, however, would not trouble a firm believer, as Shakspeare confessed to Mr. Browne that his plays were written under the influence of particular spirits, and the tones of their minds and their manners of speech, not his, were thus preserved. His own compositions he has communicated to Mr. Browne, and we cannot say they exhibit any thought or knowledge superior to that of the most ordinary man. Going to spirit-land must have been a sad failure for him if these are the results.

A "Persian spirit" in Mr. Browne's circle influences a gentleman to make some scratches bearing a distant resemblance to Oriental characters. Specimens of these are given in his book, but they are quite unintelligible to Persian scholars, and resemble the marks a child might make who had seen a book in some Eastern characters and tried to imitate them from imperfect recollection.

Mr. Browne's spirits took him comfortably right through his orthodox difficulties into a theism not differing in any important particular from that of many other thinkers, but not coinciding with the revelations of other spirit circles, and not containing a single idea which ordinary mortals are not competent to arrive at or have not reached.

In the book entitled *Where are the Dead?* we find a sample of what is called "a lying communication" quoted from the *Christian Spiritualist*, in which an obviously untruthful account was given by a "spirit" of Dr. Livingstone. In another case cited in the same book, the spirit of the late Edward Dennys, the author of *Alpha*, was made by one medium to recant all his heretical opinions, while other mediums informed his executor that Mr. Dennys still entertained the views expressed in his works, and had by no means reverted to the orthodox faith concerning the divinity of Christ. A Chinese spirit—we presume so, from his name Tien-sien-ti—gives an excellent account of Mr. Dennys' surroundings in the spirit-world, and confirms the statement that he had not changed his opinions. This spirit, on being asked "How did the assumed recantation come into the circle?" replied, "Because of the very positive way in which the minds of the circle held the theory embodied in the recantation. The spirit endeavouring to communicate through such an atmosphere would necessarily have the ideas infused into it transformed into the shape peculiar to the minds of the sitters." It was then observed that spirit communion must be a very uncertain matter, and the reply was:—

"Occasionally, yes; when the sitters are ignorant of the laws of spirit communion, and

act contrary to the requirements of the case. If an enlarged knowledge and love of truth prevailed on both sides, then spirit communion would be as satisfactory as any other form of human intercourse, as it is already in many instances."

In fact, the seekers in spirit circles usually find a reflection of their own thoughts, and in no case that we are acquainted with has anything been ascertained clearly beyond human reach. The spirits operating in the circle to which Miss Blackwell belongs teach modifications of the old doctrine of the transmigration of souls. Mr. Browne's spirits do not agree with this, and other "spirits" hold a variety of opinions corresponding with that of well-known sects and schools of thought. On the whole, however, the spirits appear to be heretical, and this is what we should expect when we consider how many persons there are seeking for materials with which to replace old beliefs that crumble to pieces under scientific and literary assault. Millions would be glad of spirit-help to solve doubts, remove difficulties, and sanction the deepest hopes of man by positive evidence that their anticipations would be fulfilled. Hence the spiritualist movement has its attractions for many worthy people, but it has also its coarse, vulgar, and absurd aspects. Sometimes it is steeped in manifest fraud, at others delusion is apparent; but when taken up by earnest, high-minded enquirers and searchers after truth, it is at any rate deserving of more respectful treatment than it sometimes receives from scientific men. The clue to its most interesting mysteries may be found in the probable fact that there are states of exalted sensitiveness on one side, and of exalted activity on the other, in which the brain condition of one person affects that of others, so that without any visible or audible means, thoughts and ideas are communicated from one to another. Dr. Carpenter (*op. cit.*) says some of his own "experiences have led him to suspect that a power of intuitively perceiving what is passing in the mind of another, which has been designated 'thought-reading,' may, like certain forms of sense-perception, be extraordinarily exalted by that entire concentration of the attention which is characteristic" of certain states that are referred to in detail in his book.

The mediumistic state bears strong relations to hysteria, and medical men well know how common it is for hysterical patients not merely to suffer from involuntarily simulated diseases, but to simulate them wilfully in order to gratify a morbid passion for exciting the wonder and attention of those about them. It is also the property of certain nervous disorders to modify character, so that persons ordinarily truthful are untruthful and tricky when under their influence, and it by no means follows because a person is trustworthy in ordinary states that he or she is so in the mediumistic condition.

Unfortunately a really scientific enquiry into all these matters is involved in greater difficulties than non-scientific persons perceive; and when scientific men like Mr. Crookes and Mr. Wallace profess themselves convinced, it is usually found that they are satisfied with what others of equal eminence

consider insufficient proof. Mr. Wallace, for example, places what most men who have shown equal capacity for scientific work would deem too much reliance upon mere testimony. If a number of respectable witnesses testified to an improbable occurrence, he would believe it, while more cautious enquirers would say it was more likely that they were deceived than that the thing they testified to really happened. Mr. Crookes has done so much good work, and shown so much prudent caution in purely scientific investigations, that all he says about spiritualism is entitled to respect, but on reading his statements about the so-called spirit "Katie," an incompleteness is manifest. He mentions a whole group of facts concerning the form, texture, pulse, heart and lung action, &c., of a certain object, all conclusive to show that she is a woman, and then lets her go and get away he knows not how. To have made his experiments as complete as in other cases where he has made important discoveries, he should have held the object tight, and defied it to slip through wall or ceiling in the presence of witnesses and plenty of light.

His beautiful experiment—which may be seen at most opticians'—in which the approach of a luminous or hot body to the blackened surfaces of four discs mounted upon slender arms like weathercock vanes causes them to revolve, has been thought by some to depend upon a force that may have an analogy to those presumed to act in spirit manifestations, but the result of many experiments made here and on the Continent seems to show that the motions are produced by heat. The discussion on "Spiritism," as its advocates call it, at the British Association meeting, leaves believers and doubters where they were.

HENRY J. SLACK.

Some Sober Inspections made into the Carriage and Consults of the Late Long Parliament. [By James Howell.] 8vo. (1656.)

JAMES HOWELL was a Caermarthenshire man, born some time late in the sixteenth century, though the precise year does not seem to be known. His father was a clergyman at Abernant, and he, like so many other distinguished Welshmen, acquired his education at Jesus College, Oxford. Anthony Wood, the Oxford historian and antiquary, who must have known him well, tells us that as

"a true cosmopolite, not born to land lease, house, or office [he] was in a manner put to seek his fortune; but by the endeavours of friends, and some money that his father assisted him with, he travelled for three years into various countries, whereby he advantaged himself much in the understanding of several languages."

The effect such knowledge had upon him may be seen by those blessed with patience sufficient to enable them to read the *Epistolæ Ho-Eliaŋæ*, a book of letters, for the most part have tried to imitate Montaigne.

Though Howell was not in any way a man of powerful intellect, he seems to have had a great facility for getting on in the world, or at least for making himself useful and getting talked about. The power of

speaking foreign tongues was by no means a common accomplishment in the reign of Charles I., and this acquirement no doubt stood him in good stead in the battle of life. When he must have been a very young man, we find him sent on public business to Spain, and shortly after his return he became secretary to the Lord President of the North. To this appointment he owed the distinction of serving in the Parliament of 1628 as burgess for the borough of Richmond, in Yorkshire. Parliamentary duties were probably not much to Howell's taste, as he seems never to have sat in any succeeding Parliament. A few years after he accompanied the Earl of Leicester on his embassy to Denmark, and is reported while there to have distinguished himself as "a quaint orator," in divers Latin speeches.

Howell seems to have flourished in these days, and to have gone on from one lucrative employment to another, until the breaking out of the war between King and Parliament threw all things into disorder. He appears to have been a man by no means careful in his living, and it is highly probable that the beginning of the Revolution might find him deeply in debt, but the House of Commons was not a court for recovering money, and therefore it cannot be true that he was sent to prison by them on that account. Certain it is, however, that by a resolution of the Commons, dated November 14, 1642, he was committed to the Fleet, "there to remain during the pleasure of the House" (*Com. Jour.* ii. 850). From Wood's memoir it would seem that he remained in gaol until the Restoration, but the sense is somewhat obscure.

His imprisonment was evidently a long one, and he improved the time most industriously. The number of books and pamphlets which flowed from his pen at this period gives him a high rank among English authors, if we estimate by quantity. He was probably surpassed, in this respect, by none of his contemporaries except William Prynne and John Lilburne.

Howell possessed that sort of talent which is useful for gaining the public ear on a sudden emergency. The man wrote for bread, and books would not have continued to be produced had they not paid for making.

The book at the head of this paper must have been one of his most fortunate ventures. It was first issued in 1653, and there are reprints of it bearing the dates of 1655, 1656 and 1660. It is a literary curiosity, not so much for what it is in itself, as for the temper of mind that is indicated by such a work being popular.

The style is bad, though not *very bad* for a hack writer of the Civil War time. It is adorned with curious out-of-the-way words, such as *cruentious*, *erogations*, *functuous* and *kardiognostic*, which he had picked up in foreign parts, and thought would look pretty if transplanted into England; but except for this, there is nothing very remarkable in the manner of the work. The matter is interesting, inasmuch as it is probably the first direct and distinct defence of Caesarism in the English tongue. The doctrine of the divine right of kings had of course been sufficiently well known from the days of Cranmer downwards, and all sorts of per-

sons had said wise and foolish things about it in print. But the divine right of kings, though a comparatively new doctrine, believed itself to be eminently old and conservative. The hereditary principle was a main part of the argument—a part so important indeed, that without it the whole theory crumbles into a ruinous heap.

This opinion, while speaking with uniform kindness of the late king, Howell entirely discards, or rather leaves unmentioned, as a view not worth notice. As between the King and Parliament his sympathies go with the monarch, but the true object of his worship is the Protector, who, "Hercules-like, may be said to have quell'd a monster with many heads; such a monster that was like to gormandise and devour the whole nation." Like Charles Martel, his hero has "followed not the ambition of his heart, as much as the inspiration of his soul, and the designs of providence."

It is not very important to know now whether James Howell was a sincere admirer of the rule which he praises, or whether, like so many others of past and present days, he wrote that which best suited the market. The important point is, that a book which pours the utmost contempt on representative institutions—which would retain Parliaments, indeed, but make them but a cumbrous machine for registering the sovereign's decrees, should have been popular. We have no evidence that Cromwell ever rewarded Howell for his work. He seems to have derived no profit from it except the legitimate one which would arise from its extensive sale.

This treatise, like so much else that has come down to us, is an evidence of the falseness of the assertion that Cromwell, during his life, was hated by any large portion of the people. It was the Parliament which had begun the war. Parliamentary committees had fined and imprisoned loyalists, pressed landmen to fight in its armies, and sailors to man its fleets, and towards the end had confiscated the lands of the gentry who had participated in the later risings in favour of Charles I. and his exiled son. Oliver had, as all men knew, been "art and part" in the judgment passed on the late king, but except for his share in that supreme act of justice, he seemed to them to have been a soldier only—a soldier on whom victory had waited as a handmaiden.

His greatest victories too had been gained, not over their own English flesh and blood, but over the wild Irish, whose hands reeked with the blood of their slaughtered Protestant kin, and over those turbulent Scots, to whom the genuine old-fashioned Cavalier never ceased to attribute all the misfortunes that befel his royal master. A usurper, no doubt, the Protector was held to be by the men who clung to the old divine-right fable, but it is easy to understand how much preferable in their eyes would be such a usurper—fresh from Tredah storm and Dunbar battlefield, to that narrow body of debaters who had fined and imprisoned, confiscated and slain, but who had never themselves conquered in war.

Howell sums up what Oliver had done for England in these words, which, if want-

ing in the fire of poetry, were strictly true and just, such as ordinary men and women could understand:—

"These are mighty things indeed, and they are marvellous in our eyes; nor do these Isles only, but every corner of the habitable earth, ring thereof, nay the sea swells high with the breath of them. England may be said to be heretofore like an animal that knew not her own strength; she is now better acquainted with herself, for in point of power and treasure she did never appear so high, both at home and abroad This makes France to cringe unto her so much; this makes Spain to offer her peace with Indian Patagons upon any terms; this makes the Hollander to dash his colours and veil his bonnet so low unto her; this makes the Italian princes, and all other states that have anything to do with the sea, to court her so much."

To the Independents language like the above would give unmixed delight, and many a royalist when he read them would sigh to think that the sovereign of whom these things could with truth be said was not the Lord's anointed, and to consider whether there was not some mistake in a theory which branded such a ruler as a usurper, while it had given to a Scotchman—weak, superstitious, and tyrannical—unlimited power over the bodies and the estates of Englishmen.

Whether Howell expressed his own opinions, or only those which he thought would be the most popular, it were hard to tell. He certainly, however, knew as well as any modern leader-writer how to hit the popular taste. There were not many Englishmen after Dunbar and Worcester who would not have concurred in the following piece of advice:—

"If I were worthy to be heard by the Lord Protector, I would make a motion that his Highness would take in at least all the land 'twixt Barwick and Edenburgh into the English Pale, and impose a new name upon it, for an eternal mark of conquest, and for the enlargement of the skirts of England."

Political history apart, there are scattered about here and there in the book passages worth remembering.

In one place he tells us that "I am not of the same opinion with Copernicus that the earth moves, and the sun stands still, yet I would be loth to swear either the one way or the other," p. 152. His grandfather, or even his father, would probably have had no such hesitation.

Near the end of the book he urges the Protector, "whom all nations cry up as the Hero of the times, and a special instrument design'd for great actions," to repair St. Paul's Cathedral, which "I have heard divers of the Reformed Churches sadly complain . . . is the ruthfull'st spectacle upon earth."

Howell had seen many foreign buildings, and he lived in times when even wise men thought Gothic architecture mean and unlovely. He must therefore have been speaking his own mind, not what he thought would sell his book, when he says that St. Paul's is "a Temple which hath above a thousand yeers lugg'd with the fury of the elements, and the iron teeth of Time; the goodliest pile of stones in the world, take all dimensions together."

EDWARD PEACOCK.

CURRENT THEOLOGY.

ON "The Reading 'Church of God' in Acts xx. 28." Dr. Ezra Abbot, of Harvard, sends a monograph (from the *Bibliotheca Sacra* for April last), which states forcibly the generally acknowledged predominance of evidence for the reading *Kypiov*. Dr. Abbot hardly strengthens his case by hinting that the Vulgate introduces theological difficulties.

Credentials of Christianity: a Course of Lectures delivered at the Request of the Christian Evidence Society (Hodder and Stoughton), is much what might have been expected—much what its predecessors have been: dealing much more with the *a priori* arguments, upon which further controversy is generally felt to be barren, than with the historical "evidences of Christianity." Prebendary Row's Lecture is an exception, and is the only thing in the volume worth notice: he puts in a telling form the argument for the substantial truth of the Gospel history derivable from the unquestioned Epistles of St. Paul.

THE second volume of the *Expositor* (Hodder and Stoughton; Strahan and Co.) has nothing in it as clever as Prof. Plumptre's curious suggestion, in the first, upon "the writings of Apollos." But the tone of the volume as a whole is higher: there is a more consistent aim at supplying information, instead of that sort of "edification" which consists in substituting stubble for wood, or at least for hay.

Scripture Readings for Schools and Families, with Comments. Fourth Series: The Gospel Times. By Charlotte M. Yonge. (Macmillan.) "The Gospel Times" are rather strangely conceived as embracing the whole period from the Captivity to our Lord's Ministry. It is doubtless a pity that Puritan prejudice against the Apocrypha has led ordinary English Bible-readers to ignore the period of Jewish history which lies between Nehemiah and Herod; and if Miss Yonge's popularity be what it was in certain circles, she will do something to remedy this evil. But if so, the benefit of her services will be qualified by some inaccuracies and more prejudices. She uses the second book of Maccabees as though it were of equal historical value to the first; and she tells us that the Asmonean high-priests were not of the line of Phineas, which Mattathias says they were; and that John Hyrcanus assumed the title of king, which Josephus says he did not.

The Child Samuel. By E. M. Goulburn, D.D., Dean of Norwich. (Rivingtons.) An admirable little book of devotional reading, "designed," as the title-page says, "as a help to meditation on the Holy Scriptures for children and young persons." It seems to be especially intended for the choristers of Norwich Cathedral, and shows a good deal of mild shrewdness, in place of the mawkish or aesthetic sentimentality which the subject or the purpose of the work might lead one to dread.

Rudiments of Theology: a First Book for Students. By Canon Norris. (Rivingtons.) It is difficult to write a "first book" on a subject of which the first principles are matters of controversy. Canon Norris has succeeded, as well as the case admitted of, in stating the principles of traditional Anglican orthodoxy in a coherent form. In Part II., on the doctrine of the Atonement, or, as he calls it, "the Soteriology of the Bible," he does something more than state his principles—showing with real ability that they will account for most of the language of the Fathers: perhaps that they may be accepted as the true deduction from that of the Apostles.

Songs of the Christian Creed and Life, selected from Eighteen Centuries, and translated by Hamilton M. Macgill, D.D. (Pickering.) The best of Dr. Macgill's translations of Latin and Greek hymns are so good, and what may be called the editorial work so well done, that it

would be ungracious to complain of inequality in the workmanship of some parts, or of the omission of some favourites from the collection. The translations of Hildebert's Prayer to the Trinity, of Nazianzen's Evening Hymn, and of that from Clemens' *Paedagogus*, may be considered real triumphs in a very difficult undertaking. With these may be ranked the beautiful hymn constructed out of a passage (c. 21) in the Augustinian *Soliloquia*. But it would have been wiser to treat the *Gloria in Excelsis* as incapable, like the *Te Deum*, of metrical translation: and to avoid competition with previous translators in cases where their work has been adequately done. Keble's translation of *φῶς ἀπὸν ἁγίας δόξης* is as good as a translation can be: even Caswall's of *Jesu dulcis memoria* is one that it would be hard to supersede. In spite of the protests of the best hymn-writers from Wesley to Faber, it has been the practice to introduce verbal improvements into almost every popular English hymn. If this practice has justified itself by its success in the case of original compositions (and we owe to it the best line of the best hymn in the language, "Hark! the herald Angels sing"), why cannot translators agree to improve upon instead of ignoring each other's labours? It perhaps was not to be expected that the translations of popular modern hymns into Latin in this volume should be as good as those of ancient ones into English: they certainly are not.

The Great Commentary of Cornelius à Lapide. Translated by Thomas W. Mossman, B.A., Rector of Torrington, Lincolnshire, assisted by various Scholars. St. Matthew's Gospel, Chaps. i. to xi. (John Hodges.) It is proposed to issue the whole of à Lapide's Commentary on the Gospels in five similar volumes, and, "should it prove acceptable," to let this be followed by other portions of the Bible. A translation of this work has no doubt a somewhat better chance of popularity than a popular edition; but the latter would be a worthier undertaking. There is no doubt a real interest and value in studying the combination of traditional and mystical application of Scripture with inchoate critical method in exegesis; but anyone who is competent to profit by the study would be able to read the Latin text as readily as the English. If, however, the text had to be translated, it is satisfactory to find it done in a thoroughly scholarly manner.

Meyer's Commentary on the New Testament. Philippians and Colossians. St. John's Gospel, Vol. II. (F. and T. Clark.) Both these translations, executed by a series of different men, but edited by Drs. W. P. Dickson and F. Crombie respectively, have the characteristic merits of Messrs. Clark's similar publications. The work is carefully and conscientiously revised, in accordance with the latest editions (posthumous, but entirely completed by the author), and the style, if not particularly easy, is always intelligible.

The Contents and Origin of the Acts of the Apostles Critically Investigated, by Dr. Edward Zeller; to which is prefixed Dr. F. Overbeck's Introduction to the Acts, from De Wette's Handbook. Translated by Joseph Dare, B.A., formerly Hibbert Scholar. Vol. I. (Williams and Norgate, Theological Translation Fund.) It is a great advantage to have so important a work as Zeller's presented to the English public in a handy and readable form; and it is a good plan to have incorporated Overbeck's essay, as presenting a form of substantially the same view, modified in the light of more recent discussion. The translation is in good English; but there are two or three passages where the sense appears to be misconceived, and the volume abounds in that worst class of misprints, false references.

Omnipotence belongs only to the Beloved; or, the Unity of Antagonisms in the Purpose of God our Saviour. Containing the First Septenary of the Names of God. By Mrs. Brewster. (Edmonston

and Douglas.) This little book must be taken as it comes: the writer has some power of measuring herself, but she has none of correcting herself; and it is useless to find fault with her. It seems as if her mind were like a medium only translucent at red heat: the effort to see through such a medium is tiring to the eyes. In spite of a method which can only be called cabalistical, and of a style which is rhapsodical, not to say hysterical, and is still further disfigured by a copious use of enigmatical catchwords, the book is worth reading, because the writer has something to say which is worth saying, though it has to be worked out by the help of some Hebrew philology that looks more than questionable. She begins by setting out a definition of two kinds of love—love of attribute, when the lover loves the beloved for some quality in the beloved that he desires; and love of personality, when the lover loves the beloved as a mother loves a baby, just because it is there to be loved. Obviously these two loves may come into conflict when the same person is the object of both; it is obvious, also, that the lover according to the love of personality may coerce the beloved for good, while the lover according to the love of attribute can accept nothing short of the free perfection of the beloved; therefore it is only when the lover is perfectly beloved that he can attain to omnipotence in love. Now, it is plausible to say that this antagonism reaches its highest point in the twofold love of God to man. The statement of the distinction is sufficient to refute most attempts of orthodox theologians to represent the traditional eschatology as ideally satisfactory, and throughout the book there is no trace of the flaccid optimism which enables the orthodox to carry the war into Africa. In fact, whenever there is an opportunity of acknowledging "the severity of God," "methinks the lady doth protest too much." She kisses the rod rather too demonstratively in our name and her own. Her solution of the problem, stated with a fervour which it is probably easy to stimulate, is ingenious rather than acceptable. The Judge is the Seed of the Woman, and as such His love includes the mother's love who constrains her child, as well as the Bridegroom's love who requires the unconstrained love of a spotless Bride. Moreover the Bride herself is filled with the constraining love of a mother to all the children of the Father, who only begins the reign of His Omnipotence when the Son has subdued every enemy. And here another element comes in, the Son, the Image of the Father, is the Desire of All Nations, even of those who reject Him in this life, in which His Chosen know Him by faith. In the Judgment every eye shall see Him. He reveals Himself to those who rejected Him, and He reveals themselves. The writer is aware that it is possible to desire good after the power to choose it has been lost; but she justly observes that we have no experience of any will sufficiently perverse to hold out for long against conscious and intense desire, and that, at the very lowest, the pain and shame of such desire for a rejected good cannot fail to dispose the sinners to yield more readily to constraining love. The distinction between the Elect and others is that the Elect are chosen unconditionally (a conditional election would have been more logical) to choose freely as the first-fruits of mankind the One True Good of Man; they are chosen to establish the kingdom which is to include all their brethren, "for both under the Old Law and the New, the Chosen People are chosen in order to the salvation to be wrought by the One Chosen Saviour." The argument is worked out in a way to make the view of the distinction between the Royal Priesthood and the Nations of the Saved, which has been spreading secretly since Irving's day, very attractive to mystical piety. The above is an outline of the writer's doctrine, rather than of her book; even so it is incomplete. It leaves out an ingenious speculation that the Devil, the accuser of the brethren, represents the culmination of isolated love of attribute, and the

Beast the culmination of the isolated love of personality, degraded and degrading, through ministering to the lower nature of the beloved; it leaves out a great many illustrations (?) of the mystery of the Trinity, some fragmentary *aperçus* on the Atonement which deserve the attention of theologians, and a great deal about "womanhood," which must be left to the criticism of physicians. And what has all this to do with the "First Septenary of the Names of God"? A disciplined writer might have answered, Not much; to an undisciplined writer it seems easier to work out an obscure train of thought imperfectly grasped by the help of a series of facts which, relevant or irrelevant, are at any rate concrete. Perhaps it has been already suggested that "Eloheem" is the name of the God of Nature, "Jehovah" of the God of Grace; those who are inclined to adopt the suggestion will be ready to agree with the author that the name "Jehovah" is a revelation of the love of attribute, which may be crossed by disobedience, while the name "Eloheem" is a revelation of the love of personality, which is willing to use evil well, to unite evening and morning, darkness and light, in one day, and find all that is made very good. It falls in well, too, with the author's system to treat "Adonai" as the "Lord of Desire," though it is startling to find how much is built on the one passage, the prediction of the Egyptian bondage, where the name "Jehovih" is differently pointed. No philologist is likely to attend to the author's inferences from the fact that the roots which signify "breast" and "destruction" are written alike in Hebrew; but in the way of mystical exegesis it might be tempting to find the unity of both in the fury of outraged maternity. The exposition of "Ehl," which is illustrated by the inferior uses of the name, is less startling, but apparently more sound; but the name most satisfactorily handled is the eighth—which, it seems, is "the firstfruits" of "the first septenary"—the "Aveer of Jacob," for instead of any pretence of philology we get a really delicate and ingenious essay on Joseph as a "type of Christ."

NOTES AND NEWS.

SIR CHARLES DILKE has an article on "English Influence in Japan" in the forthcoming *Fortnightly Review*, and one on "English Influence in China" in the forthcoming *Macmillan's Magazine*. Each is called an "additional chapter to *Greater Britain*."

MRS. HAWES's long-promised *Key to Chaucer* for children will appear before Christmas with coloured pictures and numerous woodcuts by the author. After a few general remarks on Chaucer's age, followed by a brief sketch of the pronunciation of English in the fourteenth century, a sketch of Chaucer's life introduces the young reader to some of the "Canterbury Tales." Five of these are rendered by extracts long enough to display Chaucer's humour and poetic feeling, and are pieced together with a running narrative. The text is interpreted by a modernised version, with a marginal glossary and copious footnotes. Although ostensibly addressed to the child-public, the greatest care has been taken to ensure an accurate text; and throughout the illustrations the strictest attention has been paid to the costumes, manners, and customs of the period.

M. CHARLES BIGOT, the author of *Les Classes Dirigées*, which our Paris correspondent, M. Monod, has noticed favourably in these columns, and which M. Francisque Sarcey considered so important that he delivered a *conférence* upon it, is about to transfer his services as political and literary writer from the *Siècle* to the *Dix-Neuvième Siècle*, of which M. Edmond About is the principal editor.

MESSRS. SAMPSON LOW AND Co. will shortly, we believe, publish a new novel of American life by Miss Healy, the author of *Out of the World*.

THE sixth volume of "*Documenti di Storia Italiana*, pubblicati a cura della R. Deputazione sugli Studi di Storia Patria per le provincie di Toscana, dell' Umbria e delle Marche," has just been published (Florence: Galileiana). It contains five chronicles of great importance for the study of the early history of Tuscany. They are, "*Annales Ptolomaei Lucensis*, ab anno 1061 ad annum 1303;" "*Sanzanome Judicis Gesta Florentinorum* ab anno 1125 ad annum 1261;" "*Diario di ser Giovanni di Lemmo da Comugnori*, dal 1299 al 1320;" "*Diario di Anonimo fiorentino* dall' anno 1358 al 1380;" "*Chronicon Tolosani Canonici faventini*, ad annum 1236."

MURAD EFFENDI, the Turkish *Chargé d'Affaires* at Dresden, a man well known and much liked in Dresden society, has just brought out a play, written in German, *Mirabeau*, which has been acted at Prague with great and, as the German journals assert, well merited success.

DR. FARRAR, the author of the *Life of Christ*, by his recent advocacy of Gerson's authorship of the *Imitation* suggests the remark that English theological journals are a little behind the day in their foreign bibliography; otherwise we should not have to go to the *Westminster Review* (October, 1874) for an account of some critical researches which seem to have satisfactorily established the authorship of Thomas à Kempis. The main argument is based on the system of punctuation with a view to poetical rhythm, and on the autograph MS. of the *Imitation*, which agrees with that of the acknowledged works of à Kempis. We have before us a delightful pocket-edition of the *Imitation*, in which its rhythmical characteristics are for the first time made clear. The critical labours of Dr. Hirsche (a Lutheran pastor, who has given many years to the subject) are summed up in the *Prolegomena zu einer neuen Ausgabe*, &c., vol. i. (Berlin, 1873); the pocket-edition was published by Lüderitz of Berlin in 1874. The subject appears to us one of general as well as theological interest.

A SHORT life of Heinrich Lang, of Zürich, the gifted preacher and advocate of religious reform, deserves attention (Zürich: Schmidt). It is from the pen of the philosopher Biedermann. Lang's point of view is defended in a very interesting way against Strauss, Hartmann, and Lange.

DR. S. I. CURTISS, an American scholar with a Leipzig degree, has printed a pamphlet, evidencing sound scholarship and wide reading, on the name Machabee (Leipzig: Hinrichs and Co.). He proposes a new explanation of the name, "the extinguisher"—viz., of the fire of punishment kindled by the divine wrath. This is at any rate philologically possible, and is rather favoured by the form of the Greek rendering, which implies that the *i* in the Hebrew *makkūhi* is that of the adjective. The pamphlet also contains a letter from Prof. Delitzsch, proposing to interpret the name "Who is like my father?"—the proud exclamation of the youthful Judas. Prof. Delitzsch offers an able defence of his theory, but we shall be surprised if many will find it convincing.

THE Chaucer Society has another welcome help. A paper for it on the road from London to Canterbury that Chaucer and his fellow-pilgrims rode down is to be written by perhaps the best authority in England, the Rev. W. A. Scott Robertson, Honorary Secretary of the Kent Archaeological Society. The paper will accompany William Smith's curious plan of Canterbury in 1589, and the map of the road from the first folio edition of Ogilby's *Roads*, which have already been copied for the Society by Mr. W. H. Hooper.

MESSRS. R. BENTLEY AND SON'S announcements for the coming season include:—Prof. Duncker's *History of Antiquity*, translated by Evelyn Abbott; *The Correspondence of Balzac*, with a Memoir by his Sister, Madame de Surville; *Within the Arctic Circle*, by Miss Kent; *Old New Zealand*, and a *History of the War in the*

North, told by an old Chief of the Ngapuki Tribe, by a Pakeha Maori, edited by the Earl of Pembroke; *The Letters of Elizabeth Barrett Browning to R. H. Horne*, the author of "*Orion*"; *Memorials of the South-Saxon See of Chichester*, by the Rev. W. R. W. Stephens, author of the *Life of St. Chrysostom*; *Three Years in Palestine*, by Capt. Warren, R.E., who has conducted the excavations there for the Palestine Fund; *Picturesque Holland*, translated from the French of Henry Havard; *Mothers, Wives, and Daughters*, by Lady Herbert of Lea; *Two Volumes of Sermons*, by Dr. Hook, late Dean of Chichester; and novels by Miss Broughton, Robert Buchanan, the Authoress of *Comin' thro' the Rye*, Mrs. Trollope, Julian Hawthorne, the Authoress of *The Queen of Connaught*, Mrs. Alexander, and Albany Fonblanque.

MR. WILLIAM ANDREWS proposes to issue a small history of the Custom of Dunmow.

MR. J. E. MUDDOCK, the author of *A Wingless Angel*, *John Jellaby's Housekeeper*, &c., has a new novel in the press, to be published by Mr. Samuel Tinsley. Its title is *As the Shadows Fall*.

LAST year Alberto Bacchi della Lega issued his list of the editions, translations, and adaptations of the writings of Boccaccio. It was deservedly praised at the time of its appearance. Since then Signor Narducci, Librarian of the University of Rome, has prepared a supplement, which is to be published shortly, containing particulars of 150 editions not mentioned by Bacchi della Lega.

MR. DAVID KENNEDY, junior, son of the well-known Scottish vocalist, has in the press a work descriptive of a four years' tour round the world. It will be entitled *Colonial Travel*, and will be published in October by the Edinburgh Publishing Company.

MESSRS. HARDWICKE AND BOGUE have in the press *The Care and Cure of the Insane*, by Dr. J. Mortimer Granville; and *Half Hours among English Antiquities*, by Llewellyn Jewitt.

A HIGHLY characteristic review, by Prof. de Lagarde, of Abel's *Coptic Researches*, in the current number of the *Rundschau*, gives the interesting news that the eminent poet and Orientalist Rückert undertook the study of Coptic at an advanced age, and left numerous papers bearing on that language. The reviewer wishes more points of contact could be shown between Coptic—our knowledge of which is certain—and Egyptian as read by Egyptologists, which seems to him full of improbabilities.

MR. FURNIVALL's second book for the New Shakspere Society's sixth series, that for "Shakspere's England," is now ready. It contains a reprint of three tracts, and part of a fourth:—1. The unique *Telltrothes New-years Gift, Being Robin Good-fellowes neues out of those Countries, where inhabites neither Charity nor honesty. With his owne Inuective against Jelosy*; and *The passionate Morrice*, 1593. This is a treatise against the evils of jealousy, and contains stories and sketches of the middle-class life of the time. One passage well illustrates the last long speech of Suffolk in the *First Part of Henry VI.*, about peasants bargaining "for their wives as market-men for oxen, sheep, or horse;" for the writer complains that men do exactly so in 1593, and the father takes the bargainer home, shows him his daughter: if she's plump, it's a bargain; if she's lean, she must stay another customer. 2. John Lane's *Tom Telltroths Message and his pens complaint*, 1601. This is a poem of 720 lines, in six-line stanzas, on the social evils of the day, by a friend of Milton's father, and no doubt of the boy Milton too, by a sympathiser in Spenser's sad fate, by the continuer of Chaucer's "Squire's Tale." It sketches the Seven Deadly Sins as practised in London in the author's time, instancing men's quarrels over drabs, in one of which Marlowe lost his life, the cheating at Smithfield horse-fair, &c. 3. *Tom of all Trades, or The Plaine Pathway to Preferment, Being a Discovery of a passage to Promotion in all*

Professions, Trades, Arts, and Mysteries. Found out by an old Traveller in the sea of experience, amongst the enchanted Islands of ill Fortune. Now published for Common good by Thomas Powell, 1631. Powell was a Welshman, and a London attorney, who began to write almost as soon as Shakspere. In this, his last book, he tells fathers, in a racy, sensible way, how to push their boys and girls on in the world. 4. (Unique.) *The Glasse of Godly Love. Wherein all married couples may learne their duties, each toward others, according to the holy Scriptures.* By J[ohn] R[ogers], 1569].

It is singular that the Anglo-Jewish community should have been so long without a religious catechism. This want has been supplied by Dr. Strauss, Rabbi at Bradford, in his "*Religion and Morals*, a Short Catechism, &c. To be had of the author, Bradford." We venture to suggest the correction of "huts" (Germ. *Hütten*) into "booths" (p. 16), corresponding to our "tabernacles," as more agreeable to English usage.

WE are requested to mention that Miss Cobbe's *False Beasts and True*, reviewed last week among Current Literature, is one of a series of shilling books entitled "The Country House Library," and consists of reprints, not from the *Echo*, but from the *Quarterly Review*, the *New Quarterly Magazine*, and the *Cornhill Magazine*.

MORE help for the Chaucer Society from the United States. Prof. F. J. Child, of Harvard, has undertaken to write a paper for the Society on the Language and Versification of Chaucer, basing his researches on Mr. Furnivall's Six-Text Edition of the Canterbury Tales for the Society. Prof. Child's former treatise on the same points, founded on Mr. Thomas Wright's edition of the Harleian MS. 3334, is well known as the standard work on the subject.

MRS. HAWTREY will shortly publish with Messrs. F. Warne and Co. a volume of lyrics entitled *Village Songs*.

AMONG Messrs. Smith, Elder and Co.'s announcements are:—*A History of French Literature*, by Henri Van Laun; Harriet Martineau's *Autobiography*; *English Thought in the Eighteenth Century*, by Leslie Stephen; *Etruscan Bologna*, by Richard F. Burton; the second volume of L. O. Pike's *History of Crime*; *The Functions of the Brain*, by David Ferrier, &c.

Polybiblion states that Count Alexander Frédro, "the Polish Molière," who died at Lemberg on July 15, left in manuscript sixteen or eighteen dramas, and a collection of poems, which, it is hoped, will shortly be published by his son. The same journal announces the appearance at Louvain and Lyon of the third and concluding volume of the *Bibliothèque des écrivains de la Compagnie de Jésus*, by Augustin de Backer, assisted by Alois de Backer and Charles Sommervogel.

DR. R. O. ZIEGLER announces in the Bern *Sonntagsblatt* that the first volume of a selection from the posthumous works of David Strauss will appear in the beginning of October, under the title *Literarische Denkwürdigkeiten*. It is reported to be a sort of literary autobiography, in which Strauss reviews his own works, one after another, carefully describing the origin of each from the contemporaneous outward and inward conditions of his life. This is said to be done, as may be guessed from the author's character, with the greatest openness and with unsparing self-criticism. It will certainly be a rich addition to the autobiographical literature of our time, as it will give us a near sight of the workshop and the working of one of the men by whom it has been most profoundly influenced. We believe that the *Denkwürdigkeiten* will appear as the precursor of the promised complete edition of his works.

MR. J. S. HODSON, Secretary to the Printers' Pension, Almshouse, and Orphan Asylum Corporation, sends us a prospectus advocating a celebration of the 400th anniversary of the intro-

duction of the art of printing into this country, which he fixes on Mr. Blades' authority in 1477. He concludes with a suggestion "to hold an exhibition of antiquities and curiosities connected with the art of printing at some suitable public building, such exhibition to be open for not less than a week, and to take place in June next, and to hold the Jubilee Festival of the Corporation during the same week."

HARRISON'S MS. Chronologie thus comments on the Stafford conspiracy:—

"1586[7].—Another Conspiracy is detected vpon Newyeres daie, wherein the death of our Queene is ones againe intended, by Stafford & other at the receipt of her Newyeres giftes; but, as God hath taken vpon him the defence of his owne cause, so hath he, in extraordinary manner, from time to time preserved her Majestie, his servant, from the treason and traitorous practizes of her aduersaries, and wonderfully bewraied their diuises."

We take a few more extracts from this MS. Chronologie of William Harrison, (1) showing him at St. Paul's School; (2) as to Protestant "Oysterboards"; (3) as to the evils of Plays, and of bear-baiting on Sundays:—

"1544.—Vpon the 18 of October, the Letany in thenglish toun is, by the kinges commaundement, song openly in Pawles at London; & commaundement giuen that it should be song in the same toun thorow out all England. it was vsed in London, in some parish church, even sithens June in the yere expired; & the children of Pawles schole, whereof I was one at that time, inforced to buy those bookes, wherwith we went in generall procession, as it was then appointed, before the king went to Bullen [Boulogne].

"1552.—Vpon the 23 of August the highe altar of Christes church in Oxforde was trimly decked vp after the popish maner, & about the midst of even-song, a sow cometh into the quire, & pulled all to the ground; for which heinous fact it is said that she was afterward beheaded; but to that I am not priuie. It is a world to see also, how redy the Catholikes were to cast the communion tables out of their churches, which in derision they called 'Oyster-bordes,' & to set up altars wheron to saie masse.

"1572.—Plaies are banished for a time out of London, lest the resort vnto them should ingender a plague, or rather disperse it, being alrede begonne. Would to god these comon plaies were exiled for altogether, as semonaries of impiety, & their theaters pulled downe, as no better then houses of baudrie. It is an euident token of a wicked time when plaiers wexe so riche that they can build soche houses. As moche I wish also to our comon beare baitinges vsed on the sabaothe daies."

This last extract is of considerable interest with regard to the history of theatres in London, as it is directly in the teeth of Mr. Halliwell's inferences and arguments in his lately-published *Illustrations of the Life of Shakspeare*, that there were no playhouses built for the purpose of dramatic performances before James Burbage's "The Theatre," in Shoreditch, in 1576. Harrison's words allow us to take in their natural sense Northbrooke's saying in his Treatise, 1577-8, "Doe you speake against those places also which are made uppe and builded for such playes and enterludes, as the Theatre and Curtaine is, and other suche lyke places besides?" and to reject Mr. Halliwell's suggestion that by "other *suche lyke* places" "the writer perhaps alludes to houses or taverns in which interludes were performed, speaking of such buildings generally, the construction of the sentence not necessarily implying that he refers to other edifices built especially for dramatic representations" (p. 36). Mr. Halliwell's statement on p. 42, that "when Gosson (about 1580) speaks of p. Cupid and Psyche plaid at Pauls, and a great many comedies more at the Blacke friers and in every playe house in London," he unquestionably refers to houses or taverns temporarily employed for the performances alluded to," must be modified by Harrison's previous statement.

COUNT AUERSPERG (ANASTASIUS GRÜN).

THE death of Count Anton Auersperg, which is announced at Gratz on the 12th inst., deprives Austria of one of her greatest poets. His unpretending *nom de plume*, Anastasius Grün, was known far beyond the limits of his own country and language; an English translation of one of his earliest works, *The Last Knight*, by Mr. J. O. Sargent, was published in New York as late as 1871. In Germany many of his poems are generally read and known at the present day, although none of them ever achieved popularity in the ordinary sense. Unlike most of his contemporaries Anastasius Grün has stood the test of time remarkably well, and this is the more surprising as many of his poems were inspired by the strife and struggle of the day. Count Auersperg is one of the few instances of an aristocrat espousing genuinely and lastingly Liberal, not to say Radical, principles. Although a member of an old and wealthy family, he stood up against religious and political oppression, and to his efforts as a poet and orator the regeneration of modern Austria owes much. Count Auersperg was born April 11, 1806, at Laibach, and studied at Gratz and Vienna. In 1830 he published an epic in the form of a series of ballads called *Der letzte Ritter*. It celebrates the deeds of the Emperor Maximilian I. as the last representative of chivalrous feeling. His next work, *Spaziergänge eines Wiener Poeten*, published anonymously in 1831, differs widely from the romantic tone of the preceding work. It is the first, and perhaps the most valuable, product of an epoch of political poetry in Germany which, inspired by the French rising of 1830, found its realisation in the revolutionary events of 1848 and 1849. Anastasius Grün was fully imbued with the spirit of this epoch, but he never belonged to the writers of leading-articles in verse, whom, indeed, he successfully ridicules at the beginning of his whimsical epic, *Die Nibelungen im Frack* (The Nibelungs in tailcoats), published in 1843. A collection of his minor poems had been published six years previously; it reached its fourteenth edition in 1869. Among his remaining works may be mentioned his *Pfaff vom Kahlenberg*, a spirited celebration of that Austrian type of mediæval humour. The way in which this comic figure is connected with a beautiful story is masterly; the work, moreover, is full of local colour, and conveys a vivid picture of the Austrian Court in the fourteenth century. A series of ballads on "Robin Hood," drawn from English popular sources (1864), is among the later productions of the poet. Into the political career of Count Auersperg this is not the place to enter; suffice it to say that as a member of the House of Peers he took a prominent part in the repeal of the Concordat with Rome, which for a long time had made any attempt at free investigation and utterance in Austria impossible.

F. HUEFFER.

NOTES OF TRAVEL.

IN his *Cosmos* Signor Guido Cora has wisely made a speciality of the progress of exploration in New Guinea, every step of which he closely traces. The latest news of travellers in this region may be summed up as follows. The Italian naturalist D'Albertis left Brisbane on April 20, in the little steamer *Nera*, placed at his service by the Government of New South Wales, and has entered the Fly river of southern New Guinea, intending to reach its sources in the central mountains, and thence to cross country back to the coast at Port Moresby. The Russian traveller Micluchio Maclay, writing from the Pacific in April, was then on his way to the part of the coast of Astrolabe Bay, in north-eastern New Guinea, which was named after him, going thither not only as a naturalist, but as the protector of the natives against the unjust and violent acts of European adventurers who seek personal aggrandise-

ment at whatever cost and by whatever means. The French expedition of MM. Raffray and Mairdrow, the plan of which was referred to in a former number of the ACADEMY, is now on its way to western New Guinea. The Dutch Government vessel *Surabaya*, which in the latter part of 1875 and the beginning of this year made a coasting voyage along north-western New Guinea, chiefly with a view to establishing the claim of Holland upon the coast as far as 141° E., has since made a second cruise and examination of the southern coast to the same meridian. Dr. Odoardo Beccari, who returned to Italy a short time ago after four years and a half of travel in and about New Guinea, now gives in the *Cosmos* a short preliminary account of his researches, which is full of interest and information on the people, commerce, political relations, and climate of north-western New Guinea. Among other points he sets out clearly for the first time the extent of the sovereignty of the Sultan of Tidore (Moluccas) over western Papua. The parts of New Guinea which belong directly to this ruler are called in the Moluccas "Ragia Ampat" or the territory of the four kings: these are the rajahs of Waigheu, Salvatti, Waigamma, and Misol. The King of Salvatti also nominally rules the whole of the inhabitants of the shores of Geelvink Bay, but in reality his power does not extend beyond Amberbaki; and Papua Onin belongs to the rajah of Misol, who resides at Lilinta. These rajahs pay an annual tribute of slaves, birds of paradise, and other articles to the Sultan. Naturally enough the rajahs seek to satisfy their debt of slaves as cheaply as possible by capturing them, thus giving rise to the constant raids and wars which disturb western New Guinea. The Dutch Government is, however, about to take measures for the complete suppression of the slave-traffic, by depriving the Sultan of Tidore and his satellites of all authority, and by placing European authorities in their stead at all important points. Beccari accompanied the first cruise of the *Surabaya*, and from the surveys then made, taken in connexion with all previous information, Signor Cora has drawn up a most valuable chart of the whole coast of north-western New Guinea, from Dorei to Humboldt Bay, in which there is much that is perfectly new.

Die Inseln des Stillen Oceans: eine geographische Monographie. Von Prof. Dr. Carl Meinicke. II. Bände. These volumes, the result of many years' labour, form a valuable work of reference on the geography of the Pacific. The islands of each group are described with encyclopaedic minuteness, and with a careful account in each case of the population, with their manners and customs, and religious and political institutions, past and present. In a general Introduction the author discusses the ethnology of the region, maintaining the still generally-received view that the Polynesians are nearly connected with the Malays, but are widely different, physiologically, from the Melanesians or Papuans. The inhabitants of the north-western part of the Polynesian region, or Micronesia, do not, he considers, differ more from the other Polynesians than do the Scandinavians from the Teutons. He does not allude to the various theories as to the origin of the inhabitants of the Ellice and Kingmill groups, a different race, we believe, from the other Micronesians; and one or two omissions might be pointed out inseparable from a work of this magnitude. The absence of a map is unfortunate, and although there is a good index, the notes are arranged in a manner which altogether defies reference.

LAST year's silk crop at Messina is officially reported to be the largest which has been obtained for ten years past, owing principally to the use of great quantities of silkworms' eggs selected on the method of M. Le Pasteur—that is to say, on the microscopical and cellular system. In consequence of the comparative healthiness of the

worms, good cocoons were obtained, thereby rendering the reeling operations more remunerative, as a larger proportion of first-class silks has been obtained than would otherwise have been possible. At Crete, too, last year's crop was much more abundant than usual. There, as in other parts of the Levant, the silkworm has been attacked by disease, and the rearing of it has in consequence been much neglected. Fresh seed, introduced from Japan, has met with better success, and has encouraged the peasantry to persevere with what was once a most lucrative pursuit.

THIRD SESSION OF THE INTERNATIONAL CONGRESS
OF ORIENTALISTS, ST. PETERSBURG, 1876.

(Third and Concluding Notice.)

SEPTEMBER 5 (evening sitting).—In Section I. (Siberia) M. Slovtsov read an account of the history of public instruction in Western Siberia. M. Neumann (in the Government Service of Siberia) gave a short description of the Chukchis, a people consisting of three tribes numbering altogether about 3,000, in the north-east of Siberia. M. Andrés Sobrine, an Ostiak, who appeared in his national dress, read an account in Russian of the ancient idols of the Ostiaks and the Voguls. These were eight in number, as "the goddess of hunting," "the Old Man of the Obi," &c., but they were very seldom publicly worshipped now—only hidden away in the houses of some of the people. M. Zyren-Mob Sakharow (chief of one of the Buriat tribes), who wore the native dress, a rich blue silk embroidered in gold, and also spoke in Russian, gave an account of the manners and customs of the Buriats. The communications of both these natives of Siberia were received with a great deal of applause. With reference to the committee's question as to what were the circumstances which produced such an increase of population in former times in Siberia that people after people, during a period of more than 2,000 years, had poured from it into Middle Asia, and why all this had ceased since the conquest of the country by Russia, M. Vassiliev replied that it was a mistake to suppose that Siberia had ever been such a nurse of nations. He passed in review the different peoples who had at any time played an important part in Middle Asia, and came to the conclusion that none of these could properly be said to have issued from Siberia. He was of opinion that there never had been any indigenous population of Siberia; that it never had possessed so many inhabitants as at the present time. With reference to a question of the Committee on the subject of Shamanism, M. Vassiliev stated his opinion that the word was identical with the *sha-myn* of the Chinese books, which was a corruption of the Sanskrit word for Buddhist priests—namely, *śramaṇa*—and that it was used to denote the priests of the other religions of Siberia from the former connexion of the Siberians with the Chinese. He referred to the enmity which existed between Shamanism and Buddhism, and to the persecutions to which the Shamanist Buriats had been subjected by the Lamas of Tibet.

September 6.—In Section IV. (Transcaucasia)—President, M. Patkanow—M. Bergé (President of the Archaeographic Commission of the Caucasus) presented a collection in manuscript of popular songs of the Tatars of the province of Azerbaijan. He said both their language, which extended considerably beyond the limits of Azerbaijan to parts of Persian Kurdistan, of Iran itself, &c., and their popular poetry were very little known. He had published a small collection in 1863 at Leipzig, entitled *Dichtungen transkaukasischer Sänger des XVIII. u. XIX. Jahrhunderts in Aderbeidshanischer Mundart*. This, he believed, was the first book published in this dialect in Europe. The present manuscript was a continuation of that collection, which had now become a very con-

siderable one, and not only included additional songs of the poets mentioned in his former work, but the compositions of several poets hitherto unknown. He intended to give biographical notices of the poets, and also to insert a map of the country where the Azerbaijan dialect was spoken. M. Bonnell, author of the *Litlindische Chronologie*, read an extract from his unpublished work on the Scythian-Sarmatian and other peoples. It referred to the Iranian origin of the Scythians of the Euxine Sea and the Sarmatians, as well as to the identity of these two peoples having been proved, ten years ago, by M. Mullenhoff, and drew attention to the information given by Greek and Latin writers as to the relations of these Scythians and Sarmatians with the other Oriental peoples and with their neighbours in Europe, as helping to solve the problems of the route followed by the Aryan immigrants, and of their proper grouping. M. Schmidt (of Geyersburg) sent a *résumé* of his forthcoming volume entitled *Unser Sonnenkörper nach seiner sprachlichen, physikalischen, und mythologischen Seite hin betrachtet*. He referred more especially to the striking analogies existing between the mythological ideas of the Armeno-Caucasians and the American tribes, and he thought that a comparison of their languages would show that these analogies were not accidental. M. Grigoriew here read a telegram from M. de Lesseps, President of the Provincial Congress of Orientalists then sitting at Marseilles, sending their best wishes for the success of the St. Petersburg Session. M. Patkanow, with reference to the committee's question as to the age to which "the geography" attributed to Moses of Khorene according to the text published by the Mekhitaristes in 1843 was to be assigned, gave reasons for concluding that this work could not have been composed before the beginning of the seventh century, and therefore could not have been written by Moses of Khorene, the Armenian historian of the fifth century. The work in question he attributed to Anania Chiracads, a writer of the seventh century. M. Oppert, at the request of the President, gave some account of the cuneiform texts written in the language of ancient Armenia, called Armeniac. These texts contained many ideographs which were identical with those of the Assyrian texts, but this language still remained in great part a mystery. M. Entsov (an Armenian gentleman, author of *La Femme Arménienne*, &c.) gave an account of Armenian manuscripts in general, and presented several which he had brought from the monastery of Akhpat, and which he supposed to have formed part of a considerable collection known to have been made there in the fifth century. M. Tsagareli (a Georgian, and author of some works in Russian on the Georgian language) gave an account of a considerable collection of Georgian fables and stories, of which he had undertaken a translation. Most of these were undoubtedly of indigenous origin, and he thought they might throw some light on the question of the connexion between the mythical world of the East and of the West. M. Tehoubinow, formerly Professor of Georgian at the Imperial University, read some remarks upon a collection of the laws of Georgia as containing many interesting particulars of the customs and manners of the Georgians. Most of these communications were in Russian, and few of the foreign members knew what they were about until they saw them noticed in the *Bulletin* of the Congress.

September 7.—There was no meeting of the sections. It was the anniversary of the coronation. The official delegates and foreign members of the Congress were invited, in the name of H. M. the Emperor, to a *soirée* at the Imperial Palace of Peterhof. A *déjeuner-dinatoire* was prepared for them at the Club de Commerce, after which they embarked on one of the Imperial steam-yachts for Peterhof. Here they were met by a number of the Imperial carriages, in which they drove round the park, visiting the fountains, &c., and returned to the

Palace in the evening, where they were received by Prince Galitzin, Marshal of the Court. The Palace was lighted throughout, and dinner for upwards of 100 people was served in the splendid dining-hall. The greatest hospitality was shown, and the arrangements were all excellent. The members returned to St. Petersburg by special train the same night.

September 8.—In Section VIII. (Archaeology)—President, M. Oppert—M. Gorski-Platonow (Professor of Hebrew at Moscow) read a notice of a Hebrew manuscript belonging to the Ecclesiastical Academy of Moscow, which was subscribed with the date of 4902 of the world—that is to say, of 1142 of our era. He wished it to be examined by Semitic scholars, with a view especially of ascertaining whether a date so ancient could be correct. A paper by M. Lerch was devoted to the analysis of a series of coins hitherto classed as Turanian and uncertain. Narshaki and other Arabic writers mention that a series of coins were struck at Bokhara during and after the reign of the Khalif Abu-bakr, and give us also particulars about their value, &c. M. Lerch has correlated the series of coins in question with those mentioned by Narshaki, and has found them to agree in every particular. He divides the series into four sections: the two first of these sections consisting of imitations of the coins of the Sassanian kings of the beginning of the fifth century, and the latter two containing Cufic inscriptions. The former classes have an inscription in Pehlevi, and, besides this, a series of eleven characters in a hitherto unknown alphabet. This M. Lerch proposes to call Sogdian, and he shows it is of Semitic origin and derived from some alphabet used in Mesopotamia before the time of Alexander the Great. He has found the values of the letters, and reads them as "Kudan Bukhar," which is a title and not a name. A similar title is applied by contemporary Chinese authors to the ruler of Bokhara. The President, in thanking M. Lerch for his communication, said that it constituted a real scientific discovery. M. Stickel exhibited and explained the use of a kind of frame invented by him for the exhibition of coins. M. Lagus (Professor of Arabic at Helsingfors), whose paper was in Latin, read an account of the Cufic coins and other Oriental antiquities discovered in Finland, of which he brought for exhibition at the Congress some of those recently discovered, showing the extent of the commerce that existed formerly between the north of Europe and the East. With some of these coins was found a small pair of scales with twelve weights, also exhibited by M. Lagus, and which it was shown must have been brought from the East as well as the coins. The President and M. Stickel also made some observations in Latin, and these displays of learning elicited a great deal of applause. M. Lieblein then read a paper on the Khitas, who he said were the same as the Hittites of the Bible. They dwelt originally in the southern part of Palestine. After the Hebrew conquest the greater part of them emigrated, and first took possession of the valley of the Orontes. Later on in the north-west of Syria they attained such importance as to be mentioned in the Bible as the principal people of that part of Syria in the reigns of Solomon and Jehoram. M. Harkavy (Librarian of the Imperial Library) read a paper on the name of a country mentioned in the Egyptian inscriptions which had hitherto been transcribed as "Tennu;" but he showed that the hieroglyphic for *n* might also be rendered *men*. By this change the name of the country, which was to the north of Idumea, would become "Temenu," and this was no doubt the Teman of the Bible, to the south of Palestine, which was the Arabic Yemen, and signified equally "the south." From this we could conclude that at the time of the twelfth Egyptian dynasty—that is, about 2500-2400 B.C.—Palestine had for a long time previously been inhabited by Semites, who gave names not only to places

that belonged to them, but also to neighbouring localities. M. Golenischtschew read a notice of a papyrus preserved in the Hermitage, which he assigned to the twentieth dynasty. With reference to a question of the committee, as to whether the coins or the chronicles and other non-official monuments were the more trustworthy records of the chronology of the Musulman dynasties, M. Terentiew (author of *Russia and England in the East*) gave, as an instance of the greater credibility of the former, the inscription on the sepulchral stone of Mohammad Khan Shaibani, which he had brought from Samarkand, and which bore the date of 977 of the Hejira, whereas it was well known that Mohammad Khan had been killed fifty-nine years previously, and his name from that period is no longer found on the coins. M. de Rosny gave an account of the inscription engraved on a little statuette of bronze, found at Bargusin, to the north-east of the Baikal, which was dated the fifth day of the second year of the era *tien-pao*. It had been communicated to the Congress by Dr. Neumann.

September 9.—In Section IX. (Religious Systems, &c.)—President, Prof. Douglas—a paper on “The Reform of Islamism commenced in the third century of the Hejira by Al Ash’ari, and continued by his school,” &c., was presented by M. Mehren for publication in the *Proceedings* of the Congress, of which the author gave an account. Al Ash’ari sought a middle way between the orthodox schools, which looked only to the Koran and the Sunnah or tradition, and the heterodox sects, which introduced a philosophy borrowed from the Greeks into religion, admitting the freedom of the will, &c. By the end of the fifth century the Asharite doctrine had become the general doctrine of Islamism with very few exceptions; but since that period the dogmatic development of Islamism had been arrested, and all the books subsequently written were little else but repetitions and summaries of Asharite teaching. M. Mehren considered it important to study the religious history of Mahometanism from the third to the fifth century, because it was then that the germs of religious development, though in a state of fermentation, were to be seen assuming the form which is that of the Islamism of the present day. By M. de Gubernatis an account was given of the Biblical and the Indian cosmogony, with a view of tracing the parallelism between them. Yesterday it had been announced that M. Oppert was to give his own translation of the episode of the Deluge contained in the tablets discovered by Mr. George Smith, but when he stood up for the purpose he said he was overwhelmed with sorrow at the intelligence he had that instant received by telegram, of the death of George Smith, at Aleppo, on August 19. He gave a short sketch of the career of George Smith, and paid a just tribute to the remarkable powers of his mind, which enabled him to seize at once on the characteristics of the different systems of writing. M. Oppert had intended dwelling at some length on the divergences which existed between his translations and Mr. Smith’s, but these he would now pass over in silence. He then gave his own translations, to which he added some very interesting explanations. By M. Nauphal some particulars were given of Musulman philosophy in regard to its effect on the laws of political economy. In the afternoon the members of the Congress were invited to an excursion on the Neva by the Yacht Club, and in the evening to a *soirée* at the Italian Embassy by H. E. the Chevalier Nigra.

September 10, Sunday.—The foreign members were invited in the name of H. M. the Emperor to a dinner at the Imperial Palace at Tsarskoe-Selo. They went and returned by special train, and were entertained in the same magnificent way as at Peterhof. The 11th was the festival of St. Alexander, and there was no public meeting, but in one of the rooms at the meeting-place of the Congress Colonel Sosnowski opened his exhibition of the products of Koin-sou and the other

western provinces of China for the members. Colonel Sosnowski had been deputed by the Russian Government to visit this hitherto almost unknown part of China. His collection consisted principally of the silks and teas of these provinces, which were said to be very cheap and good. On the other hand, he had collected specimens of all the English cotton and woollen goods which he found there, with their prices, which were excessively high, and it was supposed that, at least when the railway was opened to Tiumen, a very profitable trade might be carried on with these provinces. On the 12th, the proceedings terminated with a public meeting, at which it was decided that the next session of the Congress should be at Florence, and Signor Mich. Amari was chosen to be the President of that Congress. One of the members wished to thank the Emperor for his hospitality, but such feelings could not be allowed public expression; still, they were not the less entertained by all the members present. Indeed, the hospitality shown towards the members, and the liberality of the Emperor in regard to all the arrangements that had to be made, have been most conspicuous. In the evening there was a dinner at the Club de Commerce, to which the invitations were given by the President of the Congress. There were speeches in many languages. One member spoke in Japanese, and another replied to him in Chinese. Kirghis, Buriat, and Ostiak chiefs were at the dinner, and all made speeches. Whatever may have been the scientific results of the Congress, the social gatherings have been very pleasant, and the opportunities the *savans* have had of interchanging ideas will not, it is to be hoped, have been without some benefit to the cause of Oriental study. E. L. BRANDRETH.

CORRESPONDENCE.

MUTES—INITIAL, FINAL, MEDIAL, AND DOUBLE.

Kensington: Sept. 18, 1876.

In Mr. Rhys's review of Leffer's phono-physiological investigations on the sounds of consonants (*ACADEMY*, p. 293, Sept. 16), he refers to me as a “veteran” phonologist, in respect to Leffer's supposition that I am not particular in doubling my consonants, inasmuch as I spell my name *Elis*, and not *Ellis*, when writing phonetically. Of course I am very particular about doubling my consonants, and found that when asking for letters at Italian post-offices years ago I had to call myself *El-less* in order to be understood. But I am not such a “veteran” in this particular point as Mr. Rhys seems to suppose. I got my first knowledge, more than forty years ago, from Dr. R. G. Latham, who is still alive, and, although I have subsequently greatly elaborated the hints he gave in some of his earliest works, I am glad to have an opportunity of expressing my great obligations to his phonetical researches.

My present view of *p*, *t*, *k*, is that they are

absolutely mute, and that all the effects which they produce in speech are really created by glides from sounds on to them (on-glides), or glides on to sounds from them (off-glides), or by forcing voice into their cavities, so to speak (voicing), whence are formed *b*, *d*, *g*, or by condensing the air inclosed in the space limited by their especial labial, lingual, palatal, together with the general uvular epiglottal closures, by a sudden forcing up of the larynx, producing a peculiar thud (Merkel's implosion). A glide is the continuous variety of sound due to a continuous change of form in the resonance chamber of the mouth and throat, &c., during the time that continuous sound is produced in or through the larynx. There is no space, of course, to study the effects here, but I should like to call attention to a few in reference to Leffer's work. As *p*, *t*, *k* are in precisely the same condition in respect to the above changes, and as there is no occasion to dwell upon the varieties in the forms of the cavities, we may take any examples of these letters.

A. Initial *k* in *king*. B. Final *k* in *pack them*. C. Medial *k* in *packing*. D. Double *k* in *you must pack, King; pack cakes, bookcase*. All these have varieties.

A. 1) The vocal chords are closed ready for intoning a vowel before the contact for *k* is released, and the intonation begins *with* the release (not before it), and continues till the position for *i* is assumed, forming an off-glide, which is the sole audible effect ensuing upon (not existing with) *k*. This is the normal English *k*. The voice may be more or less jerked as it comes out. 2) The vocal chords are open as the contact is released, and close gradually during the time of forming the off-glide on to *i*, coming together either before or after the *i* position is assumed. There is thus a glide of *flatus* (or audible but unvoiced breath) following *k* and preceding the vowel. This is common even in England, and is the rule in North Germany; it forms the Sanskrit post-aspirate mute, while the action (1) gives the true mute. The *flatus* may be more or less strong, and may be more or less jerked as it comes out. 3) The vocal chords are closed air-tight, and the epiglottis generally forced down on the larynx, so that great effort is necessary to bring out any sound as the *k*-contact is released. This leads to various explosive effects, and sometimes to a preceding implosion, all existing in speech, but too complicated for present consideration.

B. 4)—consecutive numbers are adopted for convenience of reference—the vowel glides by continual change on to the consonant forming an on-glide, and there stops. The glide is loose (as when horses are pulled up gradually) when the vowel is long and accented, and tight (as when horses are pulled up dead) when the vowel is short and accented, and the distinction is of importance; but when the vowel is short and unaccented it usually does not glide on to the following consonant at all if both vowel and consonant are in the same word, and the consonant then acts as in (1). In English, *pack them*, however slowly we may speak the words, no sound whatever is interposed between *k* and *th*. This is our normal final mute, when any other sound follows. In *pack it up now*, there is no off-glide from the *k*, *t*, *p*, however fast the words be uttered, nor any after-sound whatever. 5) When, however, the consonant comes before a pause or silence, it is usual in English to introduce a glide, which is of two sorts, click or puff, as heard after *k* in *pack!* after *t* in *pack it!* after *p* in *pack it up!* The click is made simply by rapidly separating the contact without driving any stream of air through the mouth, but the puff requires a slight explosion. On placing the sensitive back of the hand before the lips, and producing the clicked *p*, *t*, *k*, you feel nothing; but on producing the puffed *p*, *t*, *k*, you feel the wind, and perceive that it is different in force and direction for each letter. In Sanskrit no word ends with a post-aspirated mute, but in modern Indian

speech this is frequent. Then the final mute is (4), and the final post-aspirate the puffed (5). This I lately ascertained from natives. 6) Get a Yorkshireman or Cumberlandman to say *I se to pack tubs; pack t' tubs! he packt t' tubs*, and observe in the last case the final *k*, the click, or at least inexpire glide from *k* to *t* (4), then the imploded *t'*, and finally the initial *t*. No one who cannot pronounce all these *t's*, or at least hear them, can hope to understand the English treatment of mutes. There are no after-puffs whatever.

O. 7) In *packing*, we have (1) followed by (4), without the slightest pause. The on-glide is instantaneously followed by the off-glide, just as the fall of the pendulum (representing the off-glide) instantaneously follows its rise (representing the on-glide, the highest point reached representing the mute). Of course, in *Elis* there is a slight time between the two glides because *l* is vocal and must be heard: there would be even a slight time for *Edis*. Observe how different *pack it up!* sounds from *packy tup*, with *k* (7) and *t* (1), or *packittup* with both *k* (7) and *t* (7)—distinctions almost hopeless to a Frenchman, who naturally uses (7) whenever he can, thus differing much from an Italian, to whom *pa ki tup* with both *k* (1) and *t* (1) is more natural. Of course the second part of *packing* may have any of the forms of A.

D. 8) This differs from (7) only in the interposition of a sensible silence—long when emphatic, often excessively brief in rapid speech, but always sensible—as if the pendulum were caught and held at the highest point and then let fall. The silence, however, occurs only with mutes. In my Italian *El-lees*, the *l* of *Elis* is not only sensibly prolonged, but diminished in force in the middle of its duration, though the voice never ceases. In one of these ways the Italians, to my ear, double all the consonants they write twice. The English, perhaps, never do so except in composition, as *soulless* (Dr. Latham's illustration), *boottree*, *bookcase*, *pen-knife* (where many say *penif* with (7).) Compare *un-owned*, *unknown*: I shall not be back *till eight* or *till late*.

One word on such distinctions as *hope*, *globe*, both with (4). In *globe*, (4) is modified by an action quite similar to *whole*, but differing in this respect. The "murmur" of *l* in *whole*, following the (4), may be continued and even sung upon as a long note; the "buzz" of *b* in *globe* following the (4) cannot be continued more than a very short time (though really long enough to be sung on, as I proved lately by twenty singers in chorus), without relaxing the contact at the uvula, producing *glöbm*, or at the lips, producing an indistinct after-voice comparable to the after-puff (5). I was able to make my singers distinguish *hope globe* perfectly without any after-puff or after-voice, without relaxing their *p* or *b* contact, without making the lips "softer" for *b*, and without any difference in the on-glides, except that naturally the on-glide for *p* terminates suddenly, and that for *b* gradually.

If in (1) the voice is allowed to act for the shortest possible time before contact is released, the result is *b, d, g* in place of *p, t, k*, with the same on-glides to the following vowel; and if that vowel be jerked or uttered with sudden force as it comes out, without the slightest interposition of flatus, the result is the Sanskrit post-aspirated mediae *b-h, d-h, g-h*, as now pronounced at Benares before a vowel. This I learned from two native gentlemen who both spontaneously warned me against the usual English and German errors in pronouncing these letters. The initial Sanskrit *h* of these Indians was merely such a jerk; and their final Sanskrit *h* merely a sudden pull up of the voice, without any flatus in either case.

I leave numerous points disregarded, as I feel that I have been already too lengthy. I must refer for many details to the fourth part of my *Early English Pronunciation*. ALEXANDER J. ELLIS.

TOBLER'S "DESCRIPTIONES TERRAE SANCTAE."

Munich: September 16, 1876.

With regard to Prof. E. H. Palmer's notice of my *Descriptiones Terrae Sanctae* in the ACADEMY for September 9, I do not wish to offer any lengthened defence of myself, but simply to give the reader of my work in a few words a more accurate conception of its purport. The statement that "these early travels in the Holy Land are not here edited for the first time" is not correct in the full sense of the words; for Nos. VII. and VIII., as well as Johannes Poloner, have never before been edited. The simple reference to Wright's *Early Travels in the Middle Ages* is not sufficient. Wright published an English translation from texts partially corrupt; while I have given the public a recension of the texts in the original, in which I have made use of various manuscripts. Prof. Palmer says that he has learnt little from the English pilgrim Willibald; he forgets, however, some things of considerable importance, as Monembasia in Slavonia Terra, the Buffaloes, Emesa, Salamaida, and the burning island Vulcano. TITUS TOBLER.

CATS IN ANCIENT GREECE.

Preston Weald Moors Rectory, Wellington, Salop: Sept. 18, 1876.

The domestic cat was certainly unknown, as a tame animal in their houses, to the old classical writers. The mouse-killer of the ancient Greeks and Romans was not a *felis* at all, but one of the *mustelidae*, or martens, probably the white-breasted beech-marten (*Mustela foina*, Gmel.). The γαλήν or γαλή, which Mr. Mahaffy concludes must represent the cat, is clearly some kind of *mustela*: Aristotle says the γαλή resembles the *icris** (itself evidently one of the *mustelidae*, see *Hist. An.*, ix. 7, § 5); that it attacks snakes (*ibid.*, § 4), and eats birds' eggs (ix. 2, § 4); this of itself must exclude the cat even if other evidence were wanting. I must refer Mr. Mahaffy, and others interested in this question, to Prof. Rolleston's admirable and, as I think, convincing paper "On the Domestic Cats, *Felis Domesticus* and *Mustela Foina*, of Ancient and Modern Times," in the *Journal of Anatomy and Physiology* for November, 1867.

There is no reason for believing that the domestic cat was kept as a tame animal in any other country than Egypt before the Christian era. It was in use in Constantinople about the middle of the fourth century. Ducange, s. v. *Catta*, quotes a certain writer of the Life of Gregory Nazianzen (A.D. 360 circ.) as saying "nihil in mundo possidebat praeter unam cattam, quam blandiens crebro, quasi cohabitaticem in suis gremiis refovebat." "He had nothing in the world but one cat, which he used to caress and nurse in his lap as a fellow-inhabitant of the house." Elsewhere I have suggested that the late introduction of the domestic cat from Egypt, its original home, into Europe, is due to the fact that the ancient Egyptians, who worshipped cats, were averse to the exportation of their favourite animals. They cherished the cat alive; they made a mummy of it when dead. WILLIAM HOUGHTON.

Edgbaston: Sept. 18, 1876.

May I venture to ask on what grounds Mr. Mahaffy identifies γαλήν with *Felis Catus*? In my old-fashioned ignorance I had imagined that Liddell and Scott were probably right in translating the word by "weasel"; that the γαλήν of Herodotus (Book iv.), both the African one and that which burrowed in Mount Tartessus, was a weasel; that a Greek *galea* was of weasel-skin, not cat-skin; that αἰλουπος (Herod., Bk. ii.)

* In some of the Cyclades the white-breasted marten is still called by the old Greek name *icris*. Aristotle mentions the γαλήν ἀγρία, "the wild marten," which seems to imply the use of the domestic animal; but the γαλήν ἀγρία of Strabo (Geo. iii. 2, § 6) is the ferret.

might be a cat, and that the evidently later formation of the word showed the animal to have been unnaturalised among the older Greeks, or, perhaps, anywhere except in Egypt.

The mongoose is not the only *mustela* that has been domesticated; and the thievish propensities of the genus are as strong as those of the cat, and would equally suit the allusions in Aristophanes.

W. H. H. KELKE.

London: Sept. 19, 1876.

Mr. Mahaffy's letter in the ACADEMY of last week answers itself, I think; that is to say, he quotes as evidence of his assertion that cats were domestic animals among the Greeks, two passages of Aristophanes, each containing the name of an animal, γαλή, which he identifies as a cat; and immediately afterwards he admits that there is a vagueness as to the identity. When passages which at the end of a short letter are confessed to be vague in the crucial point are triumphantly quoted at the beginning as "evidence," it is, I think, fair to say, that the letter has answered itself. That they are triumphantly quoted may be judged from the following: "as elsewhere I did not make my assertion without evidence. Here it is from no less a source than Aristophanes." We expect a new and striking discovery which shall put to shame those who think they know their Aristophanes, but instead we get only the threadbare passages which have been part of the stock in trade of those who before now have taken up this subject.

As to the question itself about cats in Greece: that has been very fully discussed from the literary point of view by Sir George Cornewall Lewis (*Notes and Queries*, 1859, Second Series, viii., p. 261), who points out that γαλή is a domesticated weasel, and is opposed to αἰλουπος, the name applied by the Greeks to a cat such as the Egyptian cat. From a zoological as well as literary point of view Prof. Rolleston has dealt exhaustively with the subject in a paper in the *Journal of Anatomy and Physiology*, vol. 1, Second Series, pp. 47-61. He also identifies the γαλή with the weasel, and altogether denies that the Greeks had domesticated cats. To this may be added the evidence of artistic remains, among which an animal resembling a weasel or marten occurs not unfrequently, but never, so far as I know, the figure of a cat. In the face of these results gained by elaborate investigation, Mr. Mahaffy allows himself to be persuaded into the belief that cats were domesticated among the Greeks by two familiar passages of Aristophanes, the vagueness of which he at the same time admits. A. S. MURRAY.

"PITTANCE" AND "ABIDE."

31 Queen Anne Street, W.: Sept. 16, 1876.

The writer of a criticism on another work in the ACADEMY of September 9 last characterises my *Dictionary of English Etymology* as a work "full of the most fantastic notions about the origin of words," and he illustrates that judgment by reference to my treatment of the words "pittance" and "abide." I should be well pleased to have the justice of Mr. Hessel's sweeping censure tried by the test of these two instances. He says that I derive *pittance* from *apitancant*, *appétissant*, "words which can only have come from Lat. *appetere*, and can therefore have nothing to do with *pittance*." Why it should be supposed that *pittance* cannot have had a Latin derivation I am unable to conjecture. It was a word used in French and Italian monasteries to signify the comparatively small allowance of more palatable food to be eaten with the bread or vegetables which formed the bulk of the meal. Now, I show that in the patois of Central France the word *pidance* is still used in precisely this sense: "Les enfants mangent souvent plus de *pidance* que de pain." And as in the same dialect a dish is said to be *apitancant* or *apitancant*, appetising, when it serves to eat with a large quantity of bread,

it seems to me that few derivations can be more completely made out. Would Mr. Hessels dispute the identity of the patois *pidance* with the synonymous *pittance* of the monasteries, or can he suppose that the former word is unconnected with the appetising (*apudantant*) nature of the food which it signifies?

With respect to *abide*, I show that opening the mouth is a physical symptom of astonishment, intent observation, entire absorption in a spectacle, and is therefore well fitted for the figurative expression of those attitudes of the mind, and thence (by the gradual softening down of the signification) of simple expectation, waiting, endurance. Now, in fact, we find verbs springing from the root *ba*—as Italian *badare*, Old Fr. *baer*, *béer*, *abaier*, *abeier*—used in the sense of opening the mouth, being intent on, expecting, waiting. And I suppose that the syllable *ba* is here used to represent the opening of the mouth, because it is pronounced by the conscious parting of the lips at the moment that we give utterance to the fundamental sound of the voice. There is surely nothing fantastic in this explanation of the expressive power of the word, if a rational origin of language is to be sought for at all.

H. WEDGWOOD.

SCIENCE.

The Principles of Hebrew Grammar. By J. P. N. Land, Professor of Logic and Metaphysics in the University of Leyden. Translated from the Dutch by Reginald Lane Poole. Part I., Sounds. Part II., Words. (London: Trübner & Co., 1876.)

ALL good Hebrew teaching, whether oral or written, now recognises the fact that the grammatical forms of the Old Testament texts are derived in accordance with definite principles of phonetic transformation from a more archaic type, which it is still in great measure possible to reconstruct by the usual methods of comparative philology, especially by the aid of the Arabic and Aramaic dialects. By keeping this fact in view, the grammarian is able to elucidate much that seems obscure, and to reduce to rule much that appears anomalous, in the phenomena of the Biblical Hebrew. Most text-books, however, make a merely subsidiary use of this historical and comparative method, which is only called in from time to time to assist the student, while the general arrangement of the grammatical system still rests on a more or less empirical classification of the phenomena of the later or written speech. As early, however, as 1861 Justus Olshausen published his *Lehrbuch*, which is based on the idea that the archaic type of Hebrew can still be recognised with essential completeness, and that accordingly it is desirable in every part of the grammar to subordinate the classification and exposition of the phenomena of the extant texts to a consideration of the older forms. Olshausen's work is not designed for beginners, and its influence on the way in which Hebrew is presented to the ordinary learner has been mainly indirect.

There have been two attempts to introduce Olshausen's method to a wider circle of students by smaller manuals on the same general plan. One of these is Bickell's very compendious *Grundriss* (Leipzig, 1869-70), the other is the grammar before us, first published at Leiden in 1869, and now translated with such additions and changes that

the translation is in truth a second edition. In this publication the English student receives for the first time a conspectus of Hebrew grammar in which every form is uniformly referred to its presumed archaic type, and explained in dependence thereon.

In the execution of his plan as well as in its design, Dr. Land usually follows Olshausen, though not without incorporating results of recent research (as in what is said of the origin of the alphabet), and revising doubtful details (as when he substitutes for the false analogy between the form לָלַח and Arabic *Conj.* III., the explanation that \dot{o} =aw).*

Generally speaking what is fresh in Dr. Land's book is not due to renewed research into the grammatical material of the language, but lies in the formal and logical features of his exposition. This is true even of his most novel view, the doctrine of the loss of quantity in the Hebrew vowels, and the inference that *qameç* and *q. haṭuph* ought not to be distinguished in pronunciation (cmp. *ACADEMY*, vol. ii. p. 21). The doctrine is not altogether new (cmp. Pinsker, *Einleitung in das Babylonisch-Hebräische Punktationssystem*, p. xvi.) and neither in his grammar nor in his fuller essay on the matter in the *Theologisch Tijdschrift*, vol. iv. p. 63, has Dr. Land brought forward new historical evidence in its favour. But he supports his conclusion by the following chain of reasoning. Rational grammar must accept the pointed text, but can free itself from traditionalism only by discarding the interpretation of the vowel-points which the Mediaeval grammarians devised under the influence of false analogies from Arabic grammar. Now the vowel-points when carefully looked at are seen to represent different qualities of sound without regard to quantity. And, as such subtle devices as *sheva*, the *hatephs*, and *metheg* prove that the authors of the punctuation sought to mark everything to which a reader must attend in order to pronounce correctly, we must conclude that correct pronunciation no longer involved a regard to quantity—in other words, that original differences of quantity had passed over into distinctions in the quality or *nuance* of sound attached to the vowels. Accordingly, Dr. Land reads the $\text{ָ} \text{ָ} \text{ָ}$ of $\text{ָ} \text{ָ} \text{ָ}$, which represents archaic *ā*, or of $\text{ָ} \text{ָ} \text{ָ}$, which corresponds to archaic *ā*, with exactly the same quality and quantity as the $\text{ָ} \text{ָ} \text{ָ}$ of $\text{ָ} \text{ָ} \text{ָ}$, which was originally *ā*.

The real value of this argument lies, I think, in the clearness with which Dr. Land grasps the truth that the vowel-points, *qameç*, *segol*, &c., properly mark quality of sound, and do not in themselves tell anything as to quantity. In fact, all recent grammarians have given up the scheme of long and short vowels with their appropriate vowel-points, which the older grammars inherited from D. Qimhi; though no one, as far as I am aware, has put the point so sharply as our author. But the other links of Dr. Land's argument can hardly be rivetted by mere dialectic without renewed historical research. The vowels of the pointed text, which Dr. Land accepts, are no more than the record of one branch of

an oral tradition of pronunciation, and it would, perhaps, be difficult to prove that the earliest grammarians, in spite of the blunders into which they fell in theory, had not received from continued oral tradition some just practical views as to the right reading of the vowels. Again, though the punctuators did not invent distinct signs for long and short vowels of the same quality, there are several things in their system which show that they recognised a longer and a more hurried pronunciation of the same vowel. The proper use of *metheg*, according to the oldest grammarians, is to lengthen a vowel. Again, in the Assyrian punctuation the vowel of an unaccented closed syllable—with the exception of *pathah*—is marked in the same way as the corresponding half-vowel, or *hateph*. And precisely in the case of *qameç*, the Western punctuation adopts the same course; for the best texts write $\text{ָ} \text{ָ}$ for *qameç haṭuph* when there is a risk of the reader pronouncing *qameç raḥab*. This usage is older than Qimhi—it is recognised by Ibn Ezra, whom Dr. Land claims as a witness in his favour—and it can hardly be doubted that it is a genuine part of the tradition of vocalisation. But if there is thus a real distinction between long and short *qameç*, it seems to be mere traditional purism to insist that the two shall be pronounced with the same quality. The punctuators no doubt did so, as Ewald and others admit, and Dr. Land refers to passages cited by Baer from the old grammarians which imply that long *qameç* inclined at least towards an *o* sound. But it is not likely that the pronunciation in *a* ever died out. We find it in Hieronymus, and in the *Hexapla* of Origen (cmp. Field's *Prolegomena*, p. lxxiii.), and it was current in the time of Ibn Ezra, though he condemns it as incorrect. Thus the pronunciation is really a matter of controversy between two schools of tradition, and there is no question that that pronunciation which distinguishes most clearly between two vowels of such different origin as *ā* and *ā*, is the best philologically and in the long run, though not perhaps at first, the easiest for the student.

Dr. Land's peculiar views on this topic will not seriously affect the utility of his book for students who have already made some progress in the language, though they certainly do not conduce to clearness in chap. ix. Whether beginners can use the book with advantage except in connexion with exceptionally careful oral instruction is doubtful even in other regards. Why, for example, is *D. lene* so constantly omitted except in special cases?

The translation is, on the whole, well done, but a few mistakes in the earlier pages may be noticed. The last sentence but one on page 3 should run, "As texts were . . . copied into later writings, many archaisms of the same kind were undoubtedly corrected in conformity with the usage of other times." At pp. 7 and 10 *hoogstens* is wrongly rendered. At p. 8, l. 19, *schuiven* seems to be confounded with *scheppen*.

W. ROBERTSON SMITH.

CURRENT SCIENTIFIC LITERATURE.

The Geological Story briefly told: an Introduction to Geology for the general reader and for beginners in the science. By James D. Dana, LL.D. (New York and Chicago: Ivison, Blackman, Taylor and Co.; London: Triibner and Co.) Just as Professor Dana has given to the student of mineralogy both a "System" and a "Manual," the former a magnificent work, indispensable to the practical mineralogist, the latter an excellent guide to the beginner, so he has felt it desirable to furnish the student of Geology with textbooks graduated to successive stages of his progress. To this end he has written a *Manual of Geology*, admirably adapted to the wants of the advanced student, and has also issued a *Text-book of Geology*, which gives a sound introduction to the science. But while preparing strong meat of this kind for those of powerful digestion, Professor Dana has by no means been unmindful of the weaker ones; and though it might be supposed, from the title of the present work, that the food had been liberally sweetened, no objection can be fairly raised on this score, since the diet by being made palatable has not become a whit the less wholesome. In fact, the "Geological Story," though told in popular style, forms a thoroughly trustworthy introduction to geology. The Story falls into three parts: the first is entitled "Rocks, or what the Earth is made of"; the second is on "Causes in Geology, and their effects"; and the third, which is by far the largest of the parts, deals with "Historical Geology." In the petrological portion, the author consistently uses the termination *-yte* to distinguish rocks from minerals, and thus we get such a word as *oolyte*, to designate an oolitic limestone. Indeed, the use of this termination is now extended to such a name as *syenyte*, which was excluded at the time Professor Dana originally suggested his reforms in nomenclature. In an elementary work of this character, it is hardly to be expected that the nice distinctions established by modern petrologists should be noticed, and hence we find, for example, the term *trap* retained as the specific designation of a rock. In the chapters on historical geology, the history of the earth is divided into archæan, palæozoic, mesozoic, and cenozoic periods. The term *Archæan* is used in the place of *azoic* which appears in the former works, and includes the Laurentian and part of the Cambrian system. Palæozoic time is divided by Professor Dana into the Silurian or "Age of Invertebrates," the Devonian or "Age of Fishes," and the Carboniferous or "Age of Coal-plants." Mesozoic time is synchronous with the author's "Age of Reptiles," while Cenozoic time is divided into the Tertiary, or "Age of Mammals," and the Quaternary, or "Era of Man." The geological sections, the characteristic fossils, and the other illustrations used in the work, are of course drawn to a large extent from American sources, but although the work is primarily adapted for American students, it may be profitably read by anyone in this country who desires to gain a knowledge of the geology of the New World. It is only fair to add that the work is profusely illustrated, well printed on excellent paper, and altogether issued in very creditable style.

Zoology for Students. By C. Carter Blake. (Daldy, Isbister and Co.) This is a handbook intended to counteract the mischievous tendency of modern zoologists to follow other guides than Hunter and Owen, and the author has been allowed to insert in his preface some notes from a lecture by the latter explaining his classification of animals according to the development of the brain. The book is clearly arranged, beginning with man and ending with acrita, which most readers will be inclined to resent as an inversion of the natural order of evolution; but as the author cultivates "a reverence for what is exact and a neglect of what is uncertain" he dismisses tunicata in a page without a hint that all vertebrates,

and therefore man, are hopefully traced up to an ascidian ancestor. The English of the book is rather slipshod, and the author has an unlucky trick of saying of all kinds of creatures that they frequently attain an "enormous" size. A reverence for what is exact would have led a more practised writer to assign the limits within which the individuals of a given species or the species of a given genus vary in size when the variation is conspicuous enough to be worth noting.

Das Gebiet der Rosanna und Trisanna (Sannengebiet in West-Tirol) mit besonderer Berücksichtigung der orographischen, glacialen, botanischen, zoologischen, geognostischen und meteorologischen Verhältnisse, nach eigenen Untersuchungen dargestellt. Von Josef Ritter von Trentinaglia-Telvenburg. (Wien: Gerold's Sohn.) It may not be amiss to explain, even to those who have some knowledge of the Tyrolean Alps, that the out-of-the-way district described in this work lies in the extreme west of North Tyrol, bordering on the Vorarlberg. Two main valleys strike through the district: the one called the Stanzertal, and the other the Paznaun: the former is watered by the Rosanna, and the latter by the Trisanna—two streams which, after their union, fall into the Inn near the little town of Landeck. It is this picturesque country of mountain and valley that von Trentinaglia has explored with patriotic enthusiasm, and the present work is consequently the result in great measure of original observation. The opening chapter describes the best routes through the district, and here we are much aided by a finely-executed map. In the next chapter the Alpine system is described, and a notion of the scenery is given in a couple of chromo-lithographs copied from the author's sketches. It appears that the highest point in the district is the Pitz Linard, which rises to a height of about 11,200 English feet above the sea-level. Although the glaciers are less extensive here than in some other parts of the Alps, they are by no means insignificant, especially in the south-western corner, between the Paznaun and the Engadine. The sketch of the geology is rather slight, but we learn that the country consists mainly of metamorphic rocks—mica-schist, hornblende-slate and gneiss—with the Algaü beds, which are probably of liassic age. The succeeding chapters are devoted to the zoology, botany, and meteorology of the district under discussion. It is not to be supposed that the author should be master of all the branches of science with which he has to deal, but with the aid of several specialists he has been able to produce a work which is comprehensive if not exhaustive. The book is not intended for the general tourist; but the student who cares to explore these romantic valleys of Tyrol will find in von Trentinaglia's memoir a well-informed companion and a trusty guide.

The Geological Record for 1874, edited by William Whitaker, B.A., F.G.S. (Taylor and Francis.) While chemists, zoologists, and many other students of science in this country have, for years past, had their periodical reports of progress, it is curious that the geologists, though an active and growing body, have not had the advantage of any systematic record registering the march of their own science. To supply this want, Mr. Whitaker has undertaken the task of preparing the present volume—a task of no small labour, though his hands have been strengthened by a large staff of contributors. The first volume of the *Geological Record* is in every way a creditable work; it runs to nearly 400 pages, and contains upwards of 2,000 entries, giving—with but few exceptions—a pithy abstract of every British and foreign paper which got into print during the year 1874. The work is divided into sections, each of which has fallen to a separate sub-editor. They include British Geology, by W. Topley; European and American Geology, by G. A. Lebour; Asiatic Geology, by F. Drew; and Australasian Geology, by R. Etheridge, jun.; Physical Geology, by A. H. Green; Applied

Geology, by W. Topley; Petrology and Mineralogy, by F. W. Rudler; Vertebrate Palæontology, by L. C. Miall; Invertebrate Palæontology, by A. H. Nicholson; Botany, by W. Carruthers; maps and miscellanea, by the editor; and an index, by H. B. Woodward. In each section the entries are arranged alphabetically under the authors' names. The task of co-ordinating the several sections and planning the entire work has fallen upon Mr. Whitaker, who deserves the warm thanks of all geologists for his disinterested labours. He has in fact given us a conspectus of all that has been done in our science during the year, and has thus set up a kind of geological milestone, telling us exactly how far we have travelled in the path of progress.

Zoological Record for 1874. We have received the eleventh volume of this now indispensable index to zoological literature, and are glad to see by the preface that it continues to receive the support of the British Association and the Zoological Society. As in the last volume the departments are undertaken by the editor, Mr. E. C. Rye, and by Messrs. Alston, Sharpe, Murie, O'Shaughnessy, Von Martens, Cambridge, Kirby, McLachlan, and Lütken. The editor informs us that Mr. Sharpe has been compelled by his engagements to relinquish the recordership of the ornithological department, which has been undertaken for the next volume by Mr. Salvin. As a change is to be made we may be allowed to suggest that the subdivisions under which this portion has hitherto been treated are somewhat cumbersome, and that it might be brought with advantage into conformity with the rest of the work.

Botanical Names for English Readers. By Randal H. Alcock. (L. Reeve and Co.) We cannot give Mr. Alcock credit for much success in his well-meant effort to render the nomenclature of the British flora intelligible to ordinary students. We are ready to endorse his statement that "it is much easier to remember names when they convey some meaning than when they are not understood;" but then we have our doubts whether the desired end is likely to be attained by pursuing Mr. Alcock's curious system of derivation. Thus we think that an average mind would be rather encumbered than assisted by the following account of the word *viola*:—

"*VIOLA*, Pliny. L. for the violet, and it was also used for the wallflower and other plants; from *G. Ion*, of Theophrastus. 'It is called *Ion*, according to Nicander, because certain nymphs of Ionia first presented this flower of (*sic*) Jove as an offering. Or, according to others, because the earth brought forth this flower for the food of Io when she was changed into a cow.' *Lonicerus*."

To this copious explanation is subjoined a footnote upon Nicander from the pages of Lempriere, apparently with the view of fulfilling Mr. Alcock's doubtful canon that "the more information names convey the less liable are they to be forgotten." Equally perplexing is the derivation of *viscum* "from *G. iros*, having the same meaning. It is said to have been originally derived from Keltic *gwid*, the shrub, on account of the reverence in which it was held by Keltic nations." *Origanum*, we are told, is from "*G. ori*, hill, and *gan*, joy—the delight of the mountains, of which the species are ornaments;" and *Borago* is from "*L. cor*, the heart, and *ago*, I move." It is undoubtedly an ingredient in claret-cup, and as such may be entitled to the distinction given it in the old distich:—

"I, Borago,
Bring alwaies courage."

Among Mr. Alcock's etymological curiosities is one which even he hesitates to accept, namely, "the ingenious conjecture of Dodonaus" as to the origin of the word *Esula*. "It may be derived from *G. pityusa*, for lay aside the first two syllables and *usa* remains, of which the diminutive is *usula*; change the first vowel and you have *esula*." If conjecture is to be the rule in

etymology we might suggest that the word was a corruption of *esulea*; but in place of offering an alternative derivation we would advise Mr. Alcock to avail himself more freely of those aids to etymology which have been made public in the three centuries which have elapsed since Dodoens wrote. This will enable him to accomplish his useful task with more satisfaction to his readers and to himself than has been the case in the present volume. To do him justice, he is painstaking and industrious; and in explaining the trivial names of plants, as well as in his remarks upon pronunciation, he is sensible enough. His modesty also may be inferred from the fact that his title-page contains no reference to the history of botany which occupies nearly half his volume. Most of the biographical notices upon which this history is based seem to have been carefully compiled, and Mr. Alcock has been able to determine from the register of St. Andrew's, Holborn, the date of our greatest herbalist's death. The entry is as follows:—"Mr. John Gerrard, freeman of the Barber Chirurgeons, buried the xviii. February, 1611." Of course there is no attempt at completeness in this section of the book; but as the lives of Sir James Smith and Robert Brown are given at length, we fail to see why no notice is taken of Sir William Hooker, to whom scientific botany is mainly indebted for the progress it has made during the last fifty years.

SCIENCE NOTES.

MICROSCOPICAL NOTES.

THE *Sitzungsberichte* of the Physico-Medical Society of Erlangen (November, 1874, to August, 1875) contains a paper by Prof. Reess, on the "Fructification of the Basidiomycetes," reviewing what has been done by Karsten, Oersted, and others, and giving his own observations. He describes the ripe spore of *Coprinus stercorearius* as opaque and seemingly homogeneous in a dry state. When it has absorbed water, "the inner contour of the brown episporium is plainly seen. The existence of the endospore is, however, first proved by the germination. The spore-contents exhibit nothing remarkable. The germination of the spore occurs in water or on moderately dry dung, upon which it ripens. In fresh dung, or dung decoction, it begins in a few hours and proceeds quickly; more so if the decoction is concentrated than 'if it is weak.' It commences with the extension of a round papilla of the colourless endospore from one, or less often from both ends." The author describes the formation of rods in diverging groups, of which he gives a figure. These rod-cells are spermatia. The *Coprinus* likewise forms carpoconia, figured as rounded swellings filled with granular protoplasm. Two other figures show the rod-cells attached to the carpoconium cells, which they fructify. The sexual organs and fructification of *Coprinus*, Professor Reess says, resemble those of lichens and *floridiae*.

In the same publication Professor Selenka describes the "Embryology of *Cucumaria dolio-lum*," which he was able to study at the zoological station at Naples. After the formation of the single-layered blastoderm, and the embryo breaks through the egg-skin, it swims freely by means of its ciliated membrane. As the flagella gradually disappear, its activity is reduced to a backward and forward motion, and when the tentacles are protruded it sinks to the ground, and moves only by crawling. After fecundation the nucleus (*Kern*) diminishes, and becomes a mere drop of protoplasm, inside which a germinal speck (*Kernhof*) appears in an hour or two. The segmentation of the yolk goes on till 250 cylindrical flagellate cells are formed.

"When the embryo emerges from the egg and swims in the open water it contracts itself in about twelve hours to about one-fifth of its diameter. Hereupon from its hinder pole, and below a flattening of the same, three to eight blastoderm cells project in-

wards. The endoderm is formed by cells springing from the flattened pole of the blastoderm, which rapidly multiply by fission. The mother-cells of the mesoderm remain in their original position, while the daughter-cells, as amoeboid bodies, or motile cells, move about in the yolk, till at last the segmentary cavity (*Furchungsköhle*) appears like a loose aggregate of stellate cells."

The author describes the formation of what he terms the primitive intestine (*Urdarm*) (which begins with an unfolding of the aboral pole), the commencement of the water-vascular system, and other matters which could not be explained without translating his paper in full.

In the same number is a long paper by Prof. Lommel "On the Interference of Refracted Light," illustrated by diagrams. This subject, as Dr. Pigott has shown, is intimately connected with the errors and false appearances obtained with microscopic lenses, but it can only be followed by those who are well acquainted with mathematical optics.

In the May number of the *Quarterly Journal of the Geological Society*, Dr. P. M. Duncan described and figured what he considers "unicellular algae," and spores that occur as parasites within Silurian and Tertiary corals. We have noticed that similar bodies occur in some of the pebbles sold at Brighton, and said to be found on the beach there, but we are informed that many of these pebbles really come from Boulogne.

At the late meeting of the French Association for the Advancement of Science, M. Heckel made remarks on the structure of the glands of certain carnivorous plants described by Darwin on the under surface of *Pinguicula vulgaris* and *Nuphar pumilum*. He stated that these glands exhibit the phenomenon of protoplasmic aggregation under the influence of solutions containing half per cent. of the salts of ammonia, and that the same facts may be observed in the glandular hairs of *Petunia*, *Sparmannia*, and *Pelargonium*, which dissolve flesh after a hyper-secretion from their glands. He thought the protoplasmic aggregation a characteristic of absorption, and that physiological aggregation might be distinguished from the morbid aggregation resulting from stronger doses of reagents (*Rev. Sci.*, Aug. 26, 1876).

We have not seen M. Pasteur's new work on Beer, but from a notice of it in the above-named periodical we find him arriving at the conclusion, suspected by other observers, that "yeast is an organ detached from a more complex plant." His *Saccharomyces*, with its chains of tubes, &c., shows a remarkable resemblance to the chains of tubes and round cells, or conidia, of *Mucor racemosus* when submerged; and when exhausted yeast is sown in a nutritive liquid, like the wort of beer, it produces cells different from the primitive sort; those from *Saccharomyces Pastorianus* having an aspect like *Dematium*.

A VERY mischievous, though botanically interesting fungus, is doing great damage to olive and orange trees in Southern California. It makes black spots on the upper and lower surfaces of the leaves, and specially grows upon the stellate hairs of the olive. It is represented as composed of beaded threads, and fructifies in several ways. The simplest form arises from one end of certain threads, and consists of cells in twos, divided by cross partitions, and differing a little in shape from the mother-cells. A second form resembles spores of *Macrosporium*. A third form resembles that of *Helminthosporium* and *Cladosporium*. There are also pycnidia like those of *Pyrenomyces*, and flask-shaped stylospores, as Tulasne calls them, which discharge spores. Prof. Farlow's paper describing and figuring this fungus will be found in the September number of the *Monthly Microscopical Journal* (reprinted from the *Bulletin of the Bussy Institution*), and the author says it is identical with that known in Europe since 1829. The pycnidia portion resembles *Antennaria elaeophila*, Mont; and

the stylospore-bearing portion, *Cymodinium citri* of Berkeley and Desmazières, *Fumago citri* of Persoon and Turpin. A gummy deposit, presumably of insect origin, favours the growth of the fungi. The same journal gives a reprint from the *Gardener's Chronicle* of Mr. Worthington Smith's last paper on the Germination of the Resting-Spores of the Potato Fungus, and contains other papers of interest, especially one by Dr. Woodward on "The Application of Photography to Micrometry, with special reference to the Micrometry of Blood in Criminal Cases." To this paper are appended three tables, one giving the measurements of red human corpuscles from eight individuals, the second of similar corpuscles from five dogs, and the third of corpuscles from a guinea-pig. The maximum human corpuscle measured 396-millionths of an inch in diameter—only two of that size being found—the smallest 216-millionths of an inch, only one such being found. The mean diameter of a group of large corpuscles was 343-millionths of an inch; the smallest average 309-millionths. The largest dog's corpuscle was 378-millionths of an inch in diameter; the smallest 237-millionths. The blood of the guinea-pig exhibited similar variations; and Dr. Woodward observes: "I think no one could have told from this drop whether it belonged to the guinea-pig, the dog, or the man."

THE *Journal of the Quckett Club* for September contains remarks on illumination in connexion with polarisation, by Mr. Bridgman, the President's address, and notes of *Tubicolaria*, *Najas*, by Mr. Fullager. Prof. H. L. Smith also describes his mode of mounting objects on thin discs of coloured wax, and with rings of the same material punched from the sheets prepared for wax-flower making; and Dr. Frances Hogan recommends as a staining fluid for membranes, or soft sections, a 1 to 2 per cent. solution of perchloride of iron, and a similar strength of solution of pyrogallie acid in water or alcohol. The object to be stained is first treated for one or two minutes with alcohol, the iron solution is filtered upon it, and then poured off. The second solution is added in the same way, and the section mounted in glycerine, balsam, or varnish.

NEW Galvanometer.—Mr. Browning has just constructed an exquisitely-sensitive galvanometer upon a plan of Mr. Ridout's. The needles are supported upon an agate centre, and are mounted in an aluminium frame. It acts so readily that merely touching with the finger a thermopile, about an inch long and less than a quarter thick, composed of two elements, produces a wide deflexion.

PHILOLOGY.

Cours de Linguistique. By F. G. Bergmann. (Paris: Sandoz et Fischbacher.) M. Bergmann, Professor of Philosophy at Strassburg, has added another book to the numerous ones he has already published on philological matters. The volume is a *résumé* of a course of lectures in which Lafontaine's fable of the town and country mice is analysed word by word. The idea is a good one, and M. Bergmann has done his best to render what he has to say interesting. Though he professes to be a follower of Bopp, his method is anything but a sound one, and certain strange theories on the origin of language and a desire to be original sometimes betray him into very questionable statements. Thus under the word *salle* he tells us that "the theme *Sala* is the euphonic substitute of the theme *Sada*, because the lingual *L* is often exchanged with the dental-lingual *D*," *Sada* itself sometimes replacing "the theme *Saka* and its homorganic forms *Sakha* and *Saga*," and the latter theme "is composed of two phonetic elements, *sa*, 'together,' and *ka*, 'to go.'" Elsewhere *vicus* is referred to the theme *ve*, "which signifies of its own proper force 'on,' 'near,' 'in,'" and the theme *ke*, which also "of its own proper force expresses the idea of 'going' and 'coming,'" and *ollus* (*ille*) to a primitive

anaras, decomposed into *ana*, "which by its consonant *N* denotes what is *there*," and *ra-s*, "which by its consonant *R* denotes what is *further off*," *anaras* itself being the origin of the Sanskrit *naras* and the Greek *ἀνῆρ*, and also—at least such must be the meaning of M. Bergmann's words—of the Hebrew *énash*, *ish*. This is, indeed, the Bow-wow theory of language with a vengeance. Equally open to question are other opinions expressed in the book, which seem due to a striving to say something new. Thus the Greek *λυκῶν* and Latin *luporum* are traced back to a form *lukosion* or *luposium*, which is asserted to have been originally the neuter of an adjective, the masculine of which, *lukosio* or *luposio*, became the singular genitive *λυκοῖο* or *lupi*; and the Sanskrit *aham*, Lat. *ego*, is declared to be "a neuter word derived from *ah* ('alas!' Lat. *hei!* Germ. *ach!*) the masculine and feminine of which are preserved in the Latin *eccus*, *ecca* ('poor'), and the vocative *ecce homo* ('poor man!')," so that *aham* should be translated "miserableness" and compared with the Greek *ἄχος*, the Latin *egens*, and the Nor. *ekki*! Similarly the attempt made in the Introduction to show that the Romance nominatives are really the old Latin nominatives, and not Latin accusatives, is hardly likely to meet with much acceptance, in spite of the ingenuity with which it is supported. However, M. Bergmann is a good Romance scholar; he has clear views on some points, and, in spite of the faults we have found in his book, it may prove interesting to well-instructed readers.

Essais d'Exégèse Rationnelle, ou études fragmentaires et familières sur la Bible et sur l'Evangile d'après l'hébraïque, l'hébraïque, allemande et française, suivis de la philosophie du sens commun. By M. Bourdonne. (Paris: Sandoz et Fischbacher.) This is a long title, but it gives a better idea than the reviewer can of the contents of a book which only a Frenchman could write or appreciate. Certainly the volume contains nothing that is new; the "studies" are very fragmentary and commonplace indeed; and the common sense displayed in it strikes one not unfrequently as uncommon nonsense. At the same time, a good number of happy epigrams are scattered through the book, and, if the information it furnishes be desultory and not always correct, it may nevertheless be novel to many readers.

On Mixed Languages. By J. C. Clough. (Longmans.) This is a prize essay intended to disprove the accepted axiom of modern linguistic science that mixed languages are impossible. Mr. Clough has divided his work into two parts, in the first of which he endeavours to prove his point by an appeal to jargons like the *Lingua Franca* of Southern Europe or the *Hindustani* of India, and such languages as Persian, Turkish, Basque, French, and German; and in the second by an analysis of the elements of our English tongue. He seems, however, to have misunderstood what is precisely meant by a denial of the possibility of a mixed language. No philologist would dream of ignoring facts so far as to deny either that a vocabulary may be the result of a mixture of two or more languages, or that social contact may cause the pronunciation and idioms of one dialect to be influenced by those of another. The question really in dispute is whether the grammar of one and the same language can follow more than one principle of formation—whether it can be partly inflectional and partly agglutinative, or partly Teutonic and partly Romanic. All the proofs, therefore, which Mr. Clough brings forward to establish the existence of languages and dialects with mixed vocabularies, pronunciation, and even idioms, are beside the point, and his attempt to set grammar aside as the ground of linguistic classification overlooks the primary fact of philological science that language is the expression and realisation of thought. The relations of grammar express the way in which a particular class of

speakers thinks, and a mixed grammar would imply a mixed thinking—that is, a double and more or less contradictory mode of mentally regarding the world and analysing thought. No doubt, vocabulary, pronunciation, and arrangement are extremely important for the proper classification of languages; but they must come in as subsidiary to grammar, not as on an equal footing with it. At the same time, it must be confessed that certain instances can be found which seem to reverse the axiom that a mixed grammar is impossible. Some of these, it is true, turn out to be new and artificial languages like the Pahlavi, which never existed as an actual and living speech, or else jargons like those dealt with by Mr. Clough at the beginning of his book. There remain other instances, however, that are not so easily explicable. Mr. Clough has noticed Persian and Turkish, but he has not referred to the most striking and puzzling examples of what seems to be a mixed grammar—the so-called sub-Semitic languages of Northern Africa, and the Assamese and similar dialects of Northern India. As it is the noun and not the verb which presents the grammatical anomaly in these cases, we may perhaps conclude that the declension of the noun does not always form so sure a ground of classification as does the conjugation of the verb, and that the received axiom of philological science should be stated with the reservation that it does not always apply to the noun. Of course, the grammar of one people may be influenced by the grammar of another: the distinction between a present and aorist in Assyrian, for instance, was due to the influence of Accadian; but this does not constitute a mixed grammar or imply the introduction of a foreign element. It is merely the introduction of new grammatical relation, and the adaptation of existing native materials to express it. This difference between a mixed grammar and a grammar influenced from abroad does not seem to have been kept quite sufficiently in view by Mr. Clough. His book, however, is well written and clearly put together, and the facts and illustrations he has collected are interesting and for the most part correct. It is, of course, impossible to avoid errors altogether in a book where much of the information required has to be taken at second-hand. But where did Mr. Clough find his five laws of William the Conqueror abolishing the use of the Anglo-Saxon tongue?

Otium Norvicense, II. by Dr. F. Field. (Oxford.) Dr. Field continues his investigations into the Greek words found in Syriac writers, and in the course of his enquiries corrects some of the comparisons made by the Dean of Canterbury in his great Syriac Lexicon. The forms of Greek words sometimes presupposed by their Syriac dress will be interesting to scholars. Many of the words are naturally derived from the Septuagint or Greek ecclesiastical writers.

FINE ART.

LANDSCAPE IN ANCIENT ART.

Die Landschaft in der Kunst der alten Völker. Von Karl Woermann. (München: Theodor Ackermann, 1876.)

THIS important and thorough work deals with a subject little touched by English scholars. Among the great array of authorities cited by the author, which form quite a literature of their own, there is not a single special treatise of any Englishman quoted, nor, indeed, can he fairly be blamed for this. While pure scholarship has made way among us, and while historical research has flourished, these secondary and outlying parts of the study of antiquity seem almost unknown in England. In Germany, on the contrary, such a subject as this, being a special department of the history of ancient art, has

been discussed in books, in periodicals, and in controversies, so that the very sifting of the materials requires great care and judgment. These qualities are in the highest degree apparent throughout this volume, which not only treats its subject very fully and clearly, but gives ample and explicit references to every borrowed authority. This honesty is particularly to be noted and commended.

Herr Karl Woermann is a painter who has travelled much through the south of Europe and in the East, studying the scanty remains of old landscape-painting at Rome and Pompeii, and examining the natural features of the countries whose art he seeks to estimate. He begins his book with an introduction on the knowledge and feeling for landscape shown by Oriental nations—Egyptians, Chinese and Japanese, Indians, and Assyrians. He is not very full on these, as they lie outside his main purpose, but yet says much that is very interesting about Japanese landscape, which is now becoming familiar to us, and about Indian, which is still strange. He shows in the latter case how a pantheistic tone of mind, while stimulating an intense passion for the beauties of nature, yet identifies the spectator with nature, as parallel manifestations of the same Divine substance. Accordingly conscious separation, or contemplation of the one by the other, is impeded. Thus the mental attitude which is requisite for landscape-painting cannot subsist. This attitude seems to be hardly and imperfectly attained even by nations who live perpetually among beautiful forms and colours, such as the Greeks and Italians. It is the English, French, Dutch, and Germans who seem alone to have studied thoroughly and manfully the art of reproducing natural beauty, which was to them no every-day thing, no matter of course, but a foreign thing, a surprise, and an exception (p. 11).

The general result of the author's survey is to deny any real power of landscape to all the Eastern world, with a qualified exception in the case of the Japanese, whose landscape-painting may be now the result of European contact, but certainly possesses considerable merit.

The second part of the book treats of Greek landscape in the art before Alexander, and here the author expands into fuller detail. He seeks to account for the notable absence of sense for the picturesque in the early Greeks by the *plastic* character of their landscape—a country whose distinct rocky outlines, blue sea, and blue sky, without clouds or forests, did not, he thinks (pp. 82, *seqq.*), suggest subjects for pictures. I am not disposed to agree with this theory, which is evidently formed upon a mere coast-view of Greece. As to his facts, the author greatly underrates the wooding of Greece, and does not seem to know that the most splendidly-picturesque scenes can be found in the mountains of Phocis and of Arcadia—indeed, almost anywhere in Greece; but here with wooding and water, and with not unfrequent storms and rifted clouds. As to his reasoning, I am convinced that to a rude people first attempting agriculture and the clearing of wild nature the most picturesque features are repugnant and disagree-

able, because they so greatly increase the toil and trouble of the labourer. It is for this reason, which I could exemplify easily in Ireland, and not because they are plastic, that rocks and precipices did not attract the early Greeks. Presently there was added the strong instinct of personifying rivers and mountains, and this separate cause was afterwards the main reason why landscape-painting did not flourish among them—a fact fully brought out by our author.

There was in fact, in the epoch up to Alexander, no independent landscape in Greek art. Herr Woermann goes through the several remains we possess with great minuteness: first (II. cap. 2, *sqq.*) the vases, with an excellent summary at page 128. He then approaches sculpture. Of course landscape, as such, is impossible in sculpture, but he justly regards it important to consider the hints afforded by the accessories, such as the backgrounds of reliefs, the isolated trees, and water, represented in bronze or marble. Thus the brackish spring and olive-tree which Phidias represented in the western pediment of the Parthenon occupy him particularly (pp. 136–7). The most curious part of this chapter is the notice of the conventional way in which the Greeks of this age represented landscape merely by the local or tutelary gods of the district—a fashion kept up in later painting, even when the mountains and rivers themselves were also depicted. This *anthropomorphische Landschaftplastik* was a very remarkable feature in Greek sculpture. In fact, Brunn thinks that the two pediments of the Parthenon may be merely two such humanised landscapes (p. 145). His analysis, as given by Woermann, is well worth reading.

But Phidias does not seem to have thought of symbolising in the features of his figures the peculiar nature which they severally represented. His local gods seem all formed on an ideal type of the purest human beauty. Later artists advanced to the idea of expressing nature in this way far more perfectly. Thus it is to Scopas that we owe the types of sea-gods, and to Praxiteles those of forest-gods, which still strike us with their wonderful suggestion of wild nature through a veil of human form. The exposition of this stage in Greek sculpture is perhaps the finest passage in the book (pp. 150, *sqq.*). The author thinks, and thinks rightly, that we here find a truer feeling for the picturesque, disguised though it be, than in any other ancient art.

The next chapter treats of early Greek painting, and shows that it was chiefly scene-painting which gave the first impetus to the study of perspective, and to the seeking after landscape effects with the conscious appreciation of illusion. The vulgar idea that the Greeks combined the natural background of their theatre with the figures on the stage is completely disposed of, and many interesting remarks follow on the scenery of the extant plays. Our purely critical scholars, who often edit Greek tragedies without any knowledge of these things, will profit greatly by both text and references of this part of the work (pp. 180, *sqq.*). It is to be regretted that the author (p. 190) puts aside comedy, as there is certainly one

allusion in Aristophanes (*Nubes*, v. 324. Σωκ. βλέπε νῦν δευρὶ πρὸς τὴν Πάρνηθ' κ.τ.λ.) which might suggest that men were not afraid to represent familiar scenes in painting—a fact which he is disposed to deny. As the real Parnes was totally invisible from the theatre, it must have been here either painted or left to pure imagination. This case is not noticed by the critics whom he cites. Nevertheless, though the first attempts at perspective were thus made, and also at indicating surfaces and distances by shades of colour, we know from the later specimens which have reached us that a thorough knowledge of either was never attained, and that the painting of the ancients never approached the perfection of modern art.

The third part of the volume treats of the change in the feeling for nature in the Hellenistic period, and examines in detail all the extant landscapes, none of which date from an earlier time. The great effect of *large cities* upon the Greek feeling for nature is well shown—an effect which seems almost everywhere a necessary condition of really appreciating solitary nature. Thus Theocritus, Bion, and Moschus show a love of picturesque country which could only be stimulated by the hot streets and sand-hills of Alexandria, or some other such city. The Romans, too, fled the *streptitum fumumque Romae*, as no old Athenian or Spartan could have done. The love of hunting and of travelling increases; the sense of weariness with toil, and longing for rest—*otia dia*—in the fields.

The remainder of the book analyses our authorities on late Greek and Roman landscape-painting, and describes carefully under distinct heads the pictures of Pompeii and of the Palatine. This portion of the book suffers from being somewhat too detailed, and from not being sufficiently illustrated. There are a few specimens of ancient landscapes given at the end, curious and instructive enough; but the most remarkable and most fully discussed—the Odyssey landscapes found on the Esquiline—are separately published in a costly volume, which I have not seen, and which is almost necessary for the proper enjoyment of the minute discussion which occupies pp. 322, *sqq.*

It is impossible within reasonable limits to mention even a tithe of the interesting and suggestive things in this book, though I have rather sought to give some notion of what may be found in it than to criticise special points. If the author is often too detailed in his exposition, he never fails to give a short summary of each chapter or subject, so that the book is eminently clear and comprehensible. It is to be regretted that our English ignorance of the great literature which he quotes is well-nigh paralleled by his equal ignorance of English landscape-painting. He seems to know nothing but Dutch, French, and German artists, for, as he well observes, the Italians (except Salvator Rosa) have done nothing in this direction. He speaks of Rottmann's views of Greece, which most of us have seen at Munich, as if they were great works of art. So great a traveller as he is might surely acquaint himself with the picturesque in English landscape-painting.

On the other hand, he knows the Pompeian landscapes better than any living man except Helbig, and a perusal of his book will be invaluable to those who are about to visit Italy, and who will never see one tithe of what they might see if they do not study beforehand such special books on special departments of antiquity and of art.

J. P. MAHAFFY.

LIVERPOOL AUTUMN EXHIBITION OF MODERN PICTURES.

THE Liverpool Corporation opened their Sixth Annual Exhibition of modern pictures on Monday the 4th inst., and they seem to have some right to the motto, "*post tenebras lux*," which is printed upon their catalogue. The exhibition is evidently growing in favour, both with artists and the public, and must have in a great measure contributed to the great awakening of interest in art which has taken place in Liverpool. A few years ago only the select few who had the run of Messrs. Agnew and Sons' rooms could have the opportunity of seeing what was doing in the art world; at present not only is there this excellent annual Corporation exhibition, but under the auspices of the Art Club, which sprang into life at about the same time, numerous collections of pictorial and decorative art have been and are from time to time thrown open to the public; while Messrs. Agnew have also organised two annual exhibitions, one of oil and one of water-colours. Indeed Liverpool, which had entirely lost her place in the world of art, is now conspicuous therein, and is setting an example which other towns are following in a spirit of generous rivalry.

Those who visit the Royal Academy will see many of their favourites on the walls of the rooms, but the exhibition is particularly rich in paintings by younger men, who have their spurs to win. It would be an exaggeration to say that they were all good and that the collection was one of *chefs-d'œuvre*, but it would be unjust to expect such to be the case, and, indeed, it is much better as it is. We want opportunities for local and provincial talent to develop itself, and nothing could be more hurtful than that London should have a monopoly of youthful ability, and alone be able to bestow the red ribbons and the red stars, more grateful albeit to the struggling painters.

The Corporation have, up to last year, spent the profits annually derived from their exhibition in purchasing works therefrom for the permanent Art Gallery of the town, but perhaps a little thoughtlessly postponed this buying till the close of the exhibition, thus allowing amateurs and dealers to have the pick of the paintings, and thereby materially restricting their own choice. As last year no purchases were made, the committee had a large sum of money at their disposal, and have very wisely laid it, or part of it, out before opening their treasures to the public.

They have acquired Sir John Gilbert's *Richard II. resigning the Crown to Bolingbroke*; *Showery Weather*, by Joseph Knight; and *Dinner Time at the Quarries*, by A. D. Fripp.

There is not much to be said for the first picture, except as a fine and harmonious grouping of colour; this, however, gives it dignity and makes it of value to the student. All the faces are undeniably Gilberts and not Plantagenets; beyond a slight mocking and impatient look in Bolingbroke's features there is no attempt to delineate character or emotion, and indeed Richard II., with his dreamy face and uplifted hand, looks more like a composer conducting a symphony than a king resigning his crown.

Mr. Knight's picture is fairly good—a meadow surrounded by green heights, beyond which a mountain rises, the sky lowering and rainy; the foreground leaves much to be desired, but on the

whole the painting is full of good feeling, and rests the eye like the aspect of nature it suggests. Mr. Fripp's drawing is very slight, and the committee might surely have found a better example of this exquisite master. It depicts a quarryman, a quarryman's son, a quarryman's grandchildren, and a quarryman's donkey, all in a line and all obtrusively happy in the cessation of work and the prospect of the dinner which the eldest grandchild has brought in a basket; the landscape, a sweep of coast and down, is, however, very charming.

By far the finest work in the room is Mr. Fildes's *Widower*, which is familiar to London, but which the people of Liverpool will be thankful to see, powerful as it is without coarseness, and pathetic without mawkishness. Mr. Fildes seems to be giving us the drama of lowly life; his pictures cannot, therefore, alas! be very pleasing or gay. May we hope that some future Fildes may not have need of such sombre hues to depict his humbler countrymen?

Mr. Leighton's portrait of Burton, and Mr. Oulless's of Sir Henry Jackson, are prominent features; also *A Sheikh at Prayer*, painted for this exhibition, by Mr. Goodall. *The Apothecary*, by Mr. Marks, sustains his well-merited popularity here; many of his works have their home in Liverpool. Mr. Cooke has sent a good example of his easel; so has Mr. Haynes Williams. Mr. Sant has a quaint, charming portrait of a young girl, painted in the style of the eighteenth century. Mr. Perugini's *Rivals*—two pretty girls, one fair and bold, the other dark and slyly demure, meeting in "the rye," but without any intention of kissing each other—marks a decided advance on what we had here from him last year; and Mr. Morgan has contributed an excellent harmonious piece of landscape and figure-painting in *Come Along*.

Calderon, Cope, Ward, Hemy, Frith, and other chiefs of rank and name, are all represented.

Among the pictures by local artists, Mr. Finnie's *Autumn Flood*, in which the painter has surpassed himself, deserves special notice: foliage, reddened and browned by Autumn, wildly bending to and fro beneath the storm, and the swollen river dashing along with angry force—a lowering sky above all, with its wind-rifts. Mr. Bond has sent a very pleasing little picture, *Among the Mountains*.

The water-colours are no less interesting than the oils: wide-spreading plains and mosses by Mr. Hartland; a sixteenth-century scene by Mr. Charles Cattermole; capital bits of humour by Mr. Roberts, who, Hunt-like, seems to have conceived an affection for country boys and bumpkins; Mr. Finnie again charming with his *Siabod* and *Too Bright for the Fly*. Mr. Kerry and Mr. Bishop are both well represented, showing that the consulting artists of the committee can paint as well as advise.

Perhaps the most noticeable drawing is Mr. Charles Green's *Country Circus*: a fine, tall girl is standing up on the broad saddle of a meek circus horse, and, throwing her shawl round her with conscious strength and dignity, she looks at the spectators with an air of superiority; all round we see every species of facial expression, from childish delight to boyish admiration of the disdainful artiste.

On the whole, perhaps the standard of excellence in the exhibition is higher than it has been heretofore, and no doubt it will improve from year to year. In the meantime the Liverpool Corporation have done good work, and the art public will not cease to be grateful for it.

F. G. PRANGE.

KIRKCALDY FINE ART EXHIBITION.

THE Fifth Annual Exhibition of the Kirkcaldy Fine Art Association opened last week with a *conversazione* in the Exhibition rooms. The Association was instituted in 1872 for the purpose of cultivating a taste for art in the town and district,

and the success which has attended it has been most gratifying and encouraging. The sales have been steadily increasing year by year, and this of itself ought to commend the exhibition to artists. The Town Hall, in which the paintings have hitherto been hung, was small and badly lighted, but the new room is centrally situated, has more wall space, and is lighted from the roof. The Association has good claims upon the public for support, for not only are its exhibitions looked forward to with pleasure, but they exercise an important educational influence, which has already borne good fruit.

In merit as well as in numbers the exhibition is considerably in advance of previous years. There are upwards of 450 pictures in oil and water-colours, some of which have been already exhibited, but many of them are now seen for the first time. Of those previously exhibited in Edinburgh and elsewhere the most important are Mr. Fettes Douglas's *Old Bureau in the Lumber Room*, full of antiquarian detail; J. B. Macdonald's fine landscape, *Strathgryre*; Charles Lees' *Winter Day: Scene on Linlithgow Loch*, one of the best of the artist's pictures, full of life and variety of expression; and W. B. Hole's *Ugly Customers*, by no means an attractive picture, but which has found a purchaser in Mr. Robert Hutchison, of Braehead, whose portrait hangs close by.

This portrait, by G. Paul Chalmers, is one of the finest of the portraits which have come from the artist's easel, unconventional in treatment and masterly in touch, the head and face painted with great force and grasp of character. The likeness is admirable, and the position, though somewhat awkward and peculiar, is, we believe, characteristic of the sitter. Another portrait by a master in the art is that of the late William Fergusson, Esq., by Sir Henry Raeburn, which it is to be hoped may be secured for the approaching exhibition of that artist's works in the Royal Academy galleries in Edinburgh. It is the likeness of a youthful member of the family of Raith in the boys' dress of our grandfathers' days, and with a handsome ingenuous face, and is a fine example of rich colour.

W. F. Douglas, besides his large picture, has three smaller ones—*The Old Book Stall*, *The Antiquary*, the book-dusting scene from Sir Walter Scott's novel, and *A Leisure Hour at Sea*, a group of sailors playing at cards. Waller H. Paton sends three pictures, of which we like best the one in water-colour, *Near Dollar*, "*When the Kye come home*."

By John Smart there are only two small sketches, *Moorland*, and *Sketch on the river Lyon*. A. Perigal contributes three pictures, all in his usual rather hard and metallic manner. Of W. Beattie Brown's two pictures, "*In Bracklin Woods*" has a good study of beech-trees. Joseph Farquharson sends *A Winter Day*, admirable in its rendering of the dreary look of nature in her snowy garb, and George Aikman *A Sheep Fank, Lubnag side*, a picturesque scene, transcribed with much realistic truth, and *The Mellow Tints of Autumn*, which in its pensive harmony of colour aptly suggests the fading year. J. B. Macdonald, besides his large picture of *Strathgryre*, has some spirited water-colour drawings, as has also W. E. Lockhart, who still has a *penchant* for the blue skies and clear air of Southern climes. J. C. Wintour's two contributions are both sadly indefinite, though one, *The Minnow Fishers*, boys at a sluice, is rather more pronounced in feature than what we have lately seen from his easel. James Cassie's single picture, *Fisherman's Cottage, Firth of Tay*, is in his mannered style, the sky a cold grey, and the sea without a wave. Of a different class are the sea-pieces of John Nesbitt, which are full of the buoyancy of leaping billows, and the dash of spray on a rocky coast.

There is a worthy rendering of canine life in *The Mendicant*, by Gourlay Steell, R.S.A., a terrier holding a basket for alms, painted in tempera, powerful in expression. Another ad-

mirable bit is J. Alexander's *Morning Pipe*, a terrier sitting on an old barrel on his hind legs, enjoying a smoke.

Other pictures that may be mentioned are Duncan Cameron's *Peat Moss near Loch Venachar*; Clark Stanton's *Papa's New Picture*, a maid-servant showing a finished canvas to a child, sadly deficient in sentiment; John R. Reid's *Dutch Fisher Girl* waiting among the bent for the boats coming in; and J. C. Noble's *Sere and Yellow Leaf*, an aged woman trudging along a woodland path, full of pensive feeling. There are also some rather sombre-looking Dutch landscapes by Van Everdingen; and by local artists there are noteworthy pictures by J. Patrick, George Gray, J. M. Dow, and D. Storrar.

The water-colours, some of which are arranged on screens in the centre of the room, form a very fair collection; and of the few pieces of sculpture we may mention D. W. Stevenson's *Fair Maid of Perth*, and W. G. Stevenson's *Pet Lamb*, both in terra-cotta, and alike full of grace and deft workmanship.

STEWART ROBERTSON.

NOTES AND NEWS.

THE late M. Firmin Didot's great collection of engravings will be sold, we hear, in Paris at the Hôtel Drouot in the month of February. Many years were spent by M. Firmin Didot in collecting the treasures which formed his cabinet.

EXCAVATIONS have been lately made in the ancient villa of the Empress Livia, situated six miles beyond Ponte Molle, upon the Via Flaminia, near Rome. The object of these new excavations is to determine with precision the site of this villa, the residence of the wife of Augustus. Fifteen years since, a fine statue of the Emperor Augustus was found on this spot and is now in the Vatican, and it is hoped that one of the Empress Livia may also be discovered.

It is in contemplation to restore the south front of the church of Saint-Germain-l'Auxerrois. More than a century back, erections were carelessly made of buildings round the church, which, having fallen into ruin, admit the rain. These are to be removed and the buttresses repaired, as a longer delay would endanger the safety of this church so interesting for its architecture and its historic associations.

DESIGNS are now on exhibition at the Hôtel de Ville at Besançon, for a monument in honour of the Cardinal Mathieu, to be placed in the cathedral of Besançon as a match to that of Cardinal Rohan. Many of them, according to the *Moniteur des Arts*, are of great merit.

THE Minister of the Interior at Madrid has recently acquired a fine collection of national seals containing as many as 5,000 pieces. This collection, according to the *Chronique*, is the first one of the kind ever made in Spain, and includes several very rare and important examples of the highest interest in the history of the national archives, some of them dating as far back as the end of the fifteenth century.

ON the occasion of the celebration of the birthday of Goethe on August 28, at the Free German Foundation (Hochstift) for Arts and Sciences at Frankfurt, an address was read from a committee which had been formed in Florence for the purpose of expressing the thanks of the Italians for the very sympathetic and generous part that the Germans took in the festival held in honour of Michel Angelo last year. It will be remembered that the German academies presented a costly and beautifully-worked wreath of oak leaves in silver, which was laid upon the column that supported Michel Angelo's bust. This bust was the work of Prof. Emilio Santerelli, the president of the committee, and has now been presented by him, on the part of the Italian academies, to the Frankfurt Hochstift to be placed in the house of Goethe, where it is hoped that it will be regarded not only as a

"worthy specimen of Italian art, but also as a symbol of the sympathy which Italians returned to national unity entertain for all civilised nations." The address was contained in a profusely decorated album, having a portrait of Goethe by Signor Matarelli for its frontispiece. It ended with the words:—

"Hail to the memory of Wolfgang Goethe!
Hail to the town of Frankfurt-am-Main!
Hail to the German people!"

THE eminent German engraver, Herr Burger, of Munich, is at present occupied upon a new engraving of Raphael's *Madonna della Sedia* in the Pitti Palace. The careful and elaborate drawing which he has made for this purpose is said to differ considerably from the well-known plates by Schaeffer and Mandel, and to excel theirs in respect of being far truer to the original.

A SUBSCRIPTION has been opened for the purpose of erecting a monument to Léopold Robert, the celebrated painter of *Les Moissonneurs*. The monument is to be placed over his grave in the cemetery at Venice.

In the *Gazette des Beaux-Arts* M. Edmond Bonnaffé, in an article entitled "A propos d'un passage de Plutarque," cites Plutarch, Pliny, and various other writers to show the small estimation in which the profession of artist was held in the ancient world, especially under the Roman sway. Rome, indeed, entirely abandoned the practice of the fine arts to her slaves and Greek subjects. "We despise such futilities," wrote Cicero, "and leave them to serve as amusement and consolation to our tributaries in their slavery." But possibly this contempt was only of the same sort as that of the fox in the fable, for the Roman mind seems to have had a natural inaptitude for the production of great works of art. It was not until the Christian Church took art into her service that the artist was regarded in any other light than as a clever workman. An interesting and comprehensive biographical study of Léon Gérôme by M. Charles Timbal, illustrated by several facsimile drawings, and by an effective etching of an Eastern river-scene, entitled *Le Prisonnier*, from a painting by Gérôme now in the Musée de Nantes; a third and last article, by M. O. Rayet, on the "Temple d'Apollon Didyméen;" a long description and history of the tapestry at the exhibition of the Union Centrale; and a review of Thausing's *Dürer*, by M. Eugène Muntz, form the other articles of the number.

THE STAGE.

"HENRY V." AT THE QUEEN'S.

ANYONE who should be ill-natured enough to affirm that the management of the Queen's Theatre have decided to revive Shakspeare's *King Henry V.* rather with a desire to gratify the eyes than the ears of their audiences might unquestionably find some support for his view in the playbill which has been printed for the occasion. In outward form this publication, extending to the unusual length of sixteen pages, cannot but be pleasing to the Shakspearean enthusiast; for, besides a pretty sketch of the famous "birth-place" at Stratford-upon-Avon, it bears upon its head and front a medallion portrait of the poet, which, albeit furnished with rather odd supporters in the persons of two lovely young ladies attired respectively in the extremes of easy undress and magnificent modern ball-costume, yet betokens a desire on the part of the management to do homage in their own way to transcendent genius. Beyond this, however, the Queen's playbill is almost entirely occupied with a list of the scenic and other accessories which rumour says have cost Mr. Coleman nearly 3,000*l.* The "public indulgence" is solicited for the present revival, not, however, in anticipation of any shortcomings in the actors, but only for the "delays" between the acts, which are declared to be unavoidable "during the first week of this production," inas-

much as "many of the set scenes are of great magnitude, especially the interior of Westminster Abbey." Further possibilities of delay seem to lurk in the promise of "Archæology" under the superintendence of Mr. E. W. Godwin; not to speak of the "Grand Incidental Ballets invented and produced by M. Léon Espinosa; the "music composed, selected, and arranged by Mr. Isaacson, who had" (we learn) "the honour of arranging the music upon the occasion of the last production of this piece in London by Mr. Charles Kean;" the "scenic effects designed and painted by Messrs. George Gordon and Harford;" the "machinery and mechanical contrivances" devised "by Mr. Jones and assistants;" the "armour for kings, princes, and knights, and the regalia for the Coronation by Messrs. Kennedy, of Birmingham, and Mr. Phillips, of London;" and the "elaborate properties and the lime-light" for which the spectator is apprised that his thanks are due to "Mr. Purvis." All this, it must be confessed, does look very much as if Shakspearean poetry were regarded in Long Acre as something intrinsically unpalatable and indigestible, and only to be rendered acceptable to the guests by the superlative arts of the many cooks whose services have been retained to that end. On the other hand it may be conceded that the Chronicle-plays are above all others susceptible of scenic illustration; and within certain limits it will hardly be denied in these days that it is possible to heighten their interest in the eyes of the judicious by liberal expenditure on their production. Even the most determined assailants of the late Mr. Charles Kean's gorgeous Shakspearean revivals at the Princess's Theatre did not venture to recommend a return to the scenic poverty and the neglect of accuracy of costume which were characteristic of our stage in its glorious infancy—although nothing short of this would seem to be implied in Mr. Collier's remark that the decline of our dramatic poetry dates from the introduction of moveable scenery. There were certainly other and more powerful causes at work to account for the decline of dramatic poetry, which at all events had declined a great deal before the fashion of associating it with moveable scenery had made any progress worth mentioning; and that the poet himself was not quite satisfied with the scanty resources of the stage in his time—at least for the production of such a play as *Henry V.*—may fairly be inferred from the lines put into the mouth of his Chorus:—

"Pardon, gentles all,
The flat unraised spirit that hath dared
On this unworthy scaffold to bring forth
So great an object. Can this cockpit hold
The vasty fields of France? Or may we cram
Within this wooden O the very casques
That did affright the air at Agincourt?"

It is more than probable that we owe some of the most beautiful descriptive passages with which the plays of Shakspeare abound to the very little illustrative aid which was then available; but as descriptive passages, however poetical, are rarely dramatic—the very essence of dramatic dialogue lying in the actual play of human passion—it is quite possible that even in losing these the stage might have gained something more than compensation for the loss. Those who complain that scenery injures the poetry of the situation, because it generally falls short of the ideal of the spectator, forget that this is a kind of objection which may be urged—and, indeed, has been very eloquently urged—against any attempt to represent the plays at all. What was the strength of the imagination of the patrons of the stage in Shakspeare's time even Mr. Collier is not able to tell us. Habit, perhaps, may have reconciled them to a Lorenzo ejaculating—

"How sweet the moonlight sleeps upon this bank," while pointing at nothing but a rush-strewn floor, or the windy galleries of an inn-yard; but it would be idle to pretend that the fine landscape scenes which are often presented on our stage

would not serve better to attune the mind of the spectator to the spirit of that exquisite passage.

Assuming, therefore, that no blame attaches to Mr. Coleman for attempting to enrich his revival with appropriate accessories, the liberality and the judgment which he has displayed in the main ought to entitle him to respectful consideration. He has not had at his disposal "a kingdom for a stage," nor has he been able to "cram" within the walls of his theatre the "casques that did affright the air at Agincourt." The depth of his stage is, indeed, not very great; and it seems to want the breadth of margin at what is known as "the wings," which is essential to the rapid and efficient working of scenery, and the due marshalling of performers in battle-scenes and other crowded displays. Hence his grandest efforts take the form rather of *tableaux* than of bustling movements. But they are very brilliant, and his masses of performers, richly attired and armed, are grouped with a skilful eye to the total effect. There was an ill-starred ballet, imagined to take place in the palace-grounds of the French King, wherein tall young ladies and little children, furnished alike with wings and beaks, were supposed to represent, in symbolical fashion, a "falcon chase," probably a stage manager's translation of *La Chasse aux Faucons*—the title by which M. Espinosa, the ballet-master, would perhaps describe it. Whatever merit there may have been in the conception of this dance, it wore in execution the air of a rather paltry conceit; and it excited, not altogether without reason, an angry demonstration in pit and gallery. In these circumstances there was surely something illogical in Mr. Coleman's stepping before the drop-curtain in the full costume of the Conqueror of Agincourt to complain bitterly of the "growing habit" of disturbing first-night performances, while promising at the same time that the obnoxious dance should not be repeated. Whether there was any covert satire in Mr. Coleman's observation, that it ought to be borne in mind that this dance is supposed to be provided for the diversion of a mad king, is not certain; but this is clearly a sort of "archæology" against which audiences would have a right to rebel; and any way the excuse laid the management open to the retort that possibly the disturbers were not quite mad enough to appreciate the compliment. A second disturbance, provoked by the appearance of twelve ladies attired after the fashion of the allegorical figure of Fame, seemed less excusable; for these formed a not unlikely, and certainly not an unpicturesque, element in the masque and pageant provided by the citizens of London, according to tradition, to welcome the return of the great King Henry from the wars. The chivalric pomp and splendour and the general appropriateness of the details of this scene should have shielded it from the insolent gibes with which some of its details were assailed by portions of the audience. And here, while recognising the right of expressing disapprobation within fair and reasonable bounds, I desire to record my protest against Mr. Coleman's concession that audiences are "the supreme arbiters" in all matters of this kind. There has been of late on the part of managers a tendency to assert, when it happens to suit them, the superior taste and judgment of their customers, which may be taken as a wholesome token of the disappearance of the old disgraceful *entente cordiale* between professional critics, editors, actors, and speculators in dramatic entertainments, but which from other points of view is less satisfactory. Mr. Hollingshead has recently replied to the censures of an able and impartial writer in the *Times* by calling his attention to the fact that his theatre pays—apparently forgetting that many things flourish in this world that are by no means deserving of success. In a like spirit a distinguished dramatist, having produced a play which had been generally condemned by the dramatic reviewers, put forth the other day an address to the public complimenting them as the "Court of Appeal," whose judgment is

final. In this case, it is true, the public only confirmed the verdict of the critics. Even if they had not, it is, of course, quite possible that they would have been right and the critics wrong; and, indeed, the public are assuredly no bad judges of dramatic wares. To set up, however, the doctrine of a sort of divine right in matters of dramatic taste based upon a vaguely-defined plébiscite of playgoers, or to teach a turbulent pit and gallery to regard themselves as inspired authorities in the matter of propriety of historical illustration, is as mischievous as most other forms of flattery and falsehood. A manager who believes himself in the right may bow to a storm of hisses; and he is certainly not bound to risk a riot rather than pronounce "aches" as a word of one syllable, in the fashion of the late John Kemble; but if his conviction is strong he should yield, only as the brave soldier may yield, to *force majeure*, and he is clearly under no obligation to compliment the taste of his opponents.

Scenery and costumes are after all not answerable for the weakness of the acting at the Queen's theatre, which is the chief objection to this Shakspearean revival. With the exception of Mr. Phelps, who appears in a prologue composed of scenes taken from the *Second Part of King Henry IV.*, and is then dismissed at about a quarter to eight in the evening, there is not an actor or actress taking a part in the play whose performance deserves much praise. Mr. Coleman, who represents the young king, is a provincial manager of some reputation; as an actor he is embarrassed by eccentricities of manner which obtrude themselves too constantly on the notice of the spectator to leave much room for any other impression. His deep-voiced delivery is, as a rule, languid and monotonous; but it pleases him occasionally to intone in a higher key a single line, which is selected for that distinction upon no intelligible grounds. Altogether he fails to convey either an impression of the youth and vivacity or the religious spirit and steadfast purpose of the hero of Agincourt. The humorous scenes have undergone much editorial amputation, but of what is left little is made by the actors, though the rather indiscriminate energy of Mr. Mead in the part of Pistol won applause by its contrast with the colourless complexion of the acting of his associates. In like manner, the very distinct declamation of Mr. Ryder in the parts of Williams and the Lord Chief Justice gave manifest satisfaction, though really the merits of his performance had "that extent, no more." The quaint garrulity and unconscious pathos of Mistress Quickly's narrative of Falstaff's end is so entirely ineffective in the mouth of the lady who enacts this part that it may fairly be said to have been a matter of indifference whether Theobald's poetical emendation "a babbled of green fields" or the painful prose of Mr. Collier's old corrector with his "pen" on "a table of green frieze" had been allowed a place in the text. Miss Fowler, however, is a pleasing representative of Katharine. Several of the prologues of the original play are introduced in a maimed and amalgamated form, and these, as well as an introductory poetical address written for the occasion, were delivered by Miss Leighton, who follows Mrs. Charles Kean in adopting the guise of the Muse of History. Where the scenic artist, however, has left so little to the imagination, the function of the old Chorus is necessarily in great degree superfluous. A few words must be added with regard to Mr. Coleman's edition of the play. To the introduction of the final scenes between King Henry IV. and his son by way of prologue there can be no serious objection; but on the whole Mr. Coleman has treated his author in most unceremonious fashion—carving out passages at will, shifting localities, transposing speeches, giving lines to other characters than those to whom they rightfully belong, and occasionally inserting words for which neither folios nor old quartos furnish any warrant. In one instance, he has even re-

versed the sense of the text. Surely all these liberties cannot be excused on Mr. Coleman's plea of the necessities of the stage arrangement of the play.

MOY THOMAS.

MDLLE. SARAH BERNHARDT IN "PHÈDRE."

Paris: September 16, 1876.

The revival of *Phèdre* at the Théâtre Français, though interesting in several ways, is chiefly valuable as settling the justice of Mdlle. Sarah Bernhardt's claim to be accounted a great tragic actress. Mdlle. Sarah Bernhardt's rise has been gradual, and in some respects unexpected. She did not, like Rachel, spring into notice in tragedy even as a beginner. What tragic power she has has come to her slowly—like the pathetic power of our own admirable actress, Mrs. Bancroft—the result, seemingly, of her mental development much more than of teaching. She lacks the lessons of "the great school;" she owes nothing to Samson and his traditions. Accordingly, her performance is habitually unequal. She does not sufficiently, though she does indeed to some extent, reserve herself for passages which, however adroitly managed, must still be exhausting, and when she is in the middle of those passages she apparently so far loses herself in them that she takes little count of her small reserve of strength, and spends her last force almost as if it were her first. At such moments she is as one possessed. Then there is a sudden collapse, and the mistake of the thing, the inequality of the thing, is visible. But the genius has been visible too.

But when we speak of mistake and inequality, it must be understood that these are wholly of execution: of, so to say, mechanical arrangement, and of physical force. There is no mistake in the conception, and no lapse in the process of its embodiment, other than that which is due to purely physical causes. In the mind of the actress, *Phèdre* lives. She is a character, a reality, and not merely that which too many of our own foremost actresses incline to make a part—a mere stage part with this or that great situation, this or that brilliant scene and effective exit. There is not a gesture or a look of Mdlle. Sarah Bernhardt's which is out of keeping with this exceptional character burdened from end to end by unholy love. The art of the performance never yields to personal display, but only to the physical pressure of overtaxed powers.

The class of character for which Mdlle. Bernhardt is naturally best fitted is that of the simple heroines of idyllic pieces, in one of which—the *Jean Marie* of M. André Theuriet—she obtained about four years ago at the Odéon an artistic success which she has never been able to surpass. Her figure, so slight and long that it has been the theme of countless bad jokes in the comic papers ever since its owner has been a celebrated person, Mdlle. Bernhardt has turned to excellent account, having had the happy thought by her style of dress to emphasise the physical peculiarity instead of trying to overcome it. This figure, and the melancholy eyes French portrait-painters have liked to reproduce, a voice full of melody, and an expression of naive simplicity which many years of the life of a woman of the world have not been able to remove, together fit Mdlle. Bernhardt very specially for the representation of slow and melancholy pastorals, such as that charming one of M. Theuriet's, and others, as simple but less doleful, by George Sand and a younger artist, M. Coppée. For this class of character she is generally most fit. But among the heroines of French classic drama there is one for which at least the physical qualities of Mdlle. Bernhardt—as they are just now seen—mark her out as quite as specially suited. A face so white and thin that with a little art it may look wasted, weird eyes, and a voice that can take tones of hopelessness—what are these if not *Phèdre's* at the moment of her despair and remorse?

The characters of classic drama are generally simple in their elements, and *Phèdre* is no exception to the rule. She is less an individual, with an individual's small peculiarities, than a type or embodiment of passion, or the conflict of passion, or of some dominating sentiment. A certain broad simplicity is in classic art of every kind, and so the artist to interpret *Phèdre* is one who will bring to bear on it, not, indeed, the heavy monotony of Mme. Janaschek, yet not the infinite variety and complexity of Desclée, but such harmony and unity as have always been in Mdlle. Bernhardt's conceptions of parts for the theatre, whatever may have been their kind. But no character in classic drama, and least of all a character of conflict, can be so very simple that it gives no choice to its interpreter of sides to lean to; and in *Phèdre* the choice is between the more prominent illustration of the evil love or that of the remorse and self-loathing which attend it. Mdlle. Rachel, say most of those who have seen her, showed morbid passion with a quite unequalled power. Charlotte Brontë, an inexperienced woman who was alive to horrors, has powerfully enough, we think, described the impression made on her by this morbid passion of Rachel's. Now Mdlle. Sarah Bernhardt hardly shows this at all: she concentrates her art somewhat, indeed, on the expression of uncertainty and hesitation and a halting between silence and avowal, but more on the illustration of an overwhelming remorse, displayed now in passionate outburst and now in self-communing not less bitter. Her own temperament and sympathies, of course, fit her for this rather than for the other. And so, in her hands, the character is ready from the first to sink under the burden of the passion Fate has charged her with, and she gives a fullness of meaning which no written criticism can hope to explain to the passage descriptive of the irresistible influence from without which has compelled her to this crime—the passage ending with her frightened outburst in the exclamation,

"C'est Vénus toute entière à sa proie attachée."

And so, also, there is a quite exceptional sadness in her utterance of the line which sums up all that divides the mind of Hippolyte, young and unsuspecting, from her own—

"Dans le fond de mon cœur vous ne pouvez lire,"

and there is an immense reality in tone and expression at every moment of consideration of the shamefulness of her fault.

This leaning, not on the expression of passion, but on the expression of the regret for passion—not on the illustration of morbid feeling but on the illustration of remorse—from the first entrance of *Phèdre* with trailing limbs and feeble knees to the last broken but determined utterance of lips with the whiteness of death, gives somewhat of new life and interest to the experience of a *dramatis persona* with whom otherwise most of us could have little to do. It is something to be able to put new wine into these old bottles. And much of the real value of Mdlle. Bernhardt's art—her unequalled, her as yet sometimes undisciplined, art in tragedy—will be found to consist in this. Alone among interpreters of classic tragedy, she can bring it, without lowering it, within the range of present life and the experience of the many. Her *Phèdre* speaks to us, not as the embodiment of feelings of a nameless horror for which since Massinger English literature and art have had no place, but as the fullest and most potent expression of regret for irremediable things. It is of that that her *Phèdre* is a type.

FREDERICK WEDMORE.

DRURY LANE THEATRE reopens this evening with Mr. Barry Sullivan in *Richard III.* Cibber's mutilated and sophisticated version is chosen for the occasion, on the plea of precedent. Garrick, we are reminded, preferred Cibber to Shakspeare, as did Henderson, Cooke, Kean, and Macready;

but it might be answered that the public of their days had grown so accustomed to certain clap-trap passages that few managers would have been daring enough to deny them the satisfaction of hearing them again. In these times, on the contrary, the public are apt to resent rash tamperings with Shakspeare's scenes.

THE Olympic Theatre will re-open on Saturday the 30th inst. with a new version of *Le Bossu*, formerly represented at the Lyceum Theatre during Mr. Fechter's management under the title of *The Duke's Motto*. Mr. Neville's version is entitled *I'm Here*.

MR. WILLS's *Jane Shore*, which has been performing for some time past in provincial towns, will be played for the first time in London at the Princess's Theatre on the 30th inst.

THE dramatised version of M. Daudet's *Fromont jeune et Risler aîné*, which has been written by the author in collaboration with M. Alphonse Belot, has been produced at the Vaudeville Théâtre. The drama unfolds a somewhat sombre, but powerful story, in which breach of the marriage vow is again the source of tragic interest. Mdlle. Pierson seems to have created a deep impression in the part of the heroine. The novel has been rendered famous by being crowned by the Academy, and attention has lately been directed to the dramatic version in preparation by the curious lawsuit of Gustave Klein, who claimed to be regarded as joint author on the ground of his having furnished a *scenario*, or sketch of scenes. M. Klein lost his cause from being unable to show that M. Daudet and his new collaborator had profited by any portion of his suggestions. The play being now made public, he may possibly be more successful in another attempt.

M. PAUL FERRIER's new comedy in verse entitled *Les Compensations* has been produced with success at the Gymnase. Its theme is but a new variety of the old subject treated in *Le plus heureux des trois*. Its plot is described as "very French and very droll." It illustrates, we are told, the Voltairian philosophy in private life—its leading idea being that every misadventure in our lives is attended by some compensation, which leaves us a fair balance when accounts are equitably summed up.

THE week at the Théâtre Français has been not uneventful, for not only has Mdlle. Sarah Bernhardt reappeared as Phèdre—a performance which has hardly until now been mature in her hands, or at all final in its form—but Mdlle. Croizette, after a long illness, has reappeared in *Le Gendre de M. Poirier*. Mdlle. Emilie Broissat has been seen in *Philberte*, and M. Got in two familiar impersonations—that of M. Poirier and that of l'Abbé in *Il ne faut jurer de rien*. Mounet-Sully, Maubant, Martel, and Blanche Baretta have supported Sarah Bernhardt in *Phèdre*: a performance which, with the present cast, succeeds in drawing money from the public and in eliciting a violence of applause generally reserved in the French theatres for the *claque* alone.

THE Odéon gave last week a good performance from the little-used repertory: *Le Légataire Universel* being selected for representation. The same night M. Keravel, whom the "Second Théâtre Français" has appropriated to itself from the Conservatoire, made his first appearance in the Quartier Latin.

Two favourite artists of the Odéon, whom London was able to admire last season, were married to each other on Thursday in last week at the church of St. Vincent de Paul. M. Marais and Mdlle. Hélène Petit, the young Russian noble and the serf girl of the *Danicheff*, were at their posts at the Odéon in the evening.

MUSIC.

THE prospectus of the new series of Saturday concerts at the Crystal Palace has just been issued, and displays the same enterprise and research which we are accustomed to associate with these excellent concerts and their able conductor, Mr. Manns. Among the more important novelties and revivals are the following—Purcell's *Yorkshire Feast Song*, a concerto by Bach, Haydn's *Tempest*, a violin concerto and a piano concerto by Mozart (both for the first time), the lately-discovered fragment of a violin concerto by Beethoven, Weber's *Preciosa* music, Schumann's *Manfred* music (let us hope, complete), Berlioz, selection from *Benedict and Beatrice*, Gade's *Erl King's Daughter*, Brahms's *Rinaldo*, Raff's overture on "Ein feste Burg," Wagner's "Walküre-Ritt" and Philadelphia March, Rubinstein's "Ocean" symphony, and second piano concerto, &c., &c. The first concert takes place next Saturday, the 30th instant, when Mr. Frits Hartvigson will play (for the first time in England) Hans von Bronsart's concerto for piano in F sharp minor.

On Monday last Mr. Carl Rosa repeated Cherubini's *Water Carrier* at the Lyceum; on Tuesday the *Sonnambula* and on Wednesday *The Lily of Kilmarney* were the works given. Of the production of Adam's *Giralda*, which took place on Thursday, just as we go to press, we must defer our notice till next week. Last night the *Water Carrier* was again to be played, and for to-night the *Bohemian Girl* is advertised. It is most pleasing to add that the public appears fully to recognise the excellence of the entertainment offered by Mr. Rosa, and that the support given to him seems, if possible, even more cordial than last year at the Princess's. In the course of next week it is intended to produce Wagner's *Flying Dutchman*.

THE Borough of Hackney Choral Association has just issued its prospectus for the coming season, the twenty-seventh of its existence. It is intended during the season to give three subscription concerts, with full orchestra, in the Shoreditch Town Hall, at which, in addition to miscellaneous vocal and instrumental selections, Schubert's Mass in F, Mendelssohn's *Athalia*, and Randegger's *Fridolin* are to be performed. The production of Schubert's great Mass at the first concert will be of especial interest to musicians, as the work, which is one of its composer's finest, has never yet been heard in London.

THE Opéra Comique at Paris is to open for the season on the 30th inst. with *Piccolino*, which is to be followed by *Fra Diavolo*. Among other works to be given in the course of the season are the *Pré aux Clercs*, *L'Eclair*, *Zampa*, *Le Déserteur*, and *Lalla Roukh*.

THE post of librarian at the Conservatoire of Paris, rendered vacant by the death of Félicien David, has been filled by the appointment of M. Wekerlin, who for the last five years has been sub-librarian.

FRENCH papers announce the death last week of Victor Prilleux, for many years one of the most distinguished singers at the Opéra Comique, Paris. M. Prilleux was sixty-two years of age.

THE season of opera at Madrid will commence about October 10; four works new to that city will be given in the course of the winter. These are *L'Etoile du Nord*, *Fra Diavolo*, *Mignon*, and *Hamlet*.

We are glad to learn from the German musical papers that Dr. Hans von Bülow has completely recovered his health. He is at present at Godesberg on the Rhine.

It is said that the late George Sand has left among her posthumous works an opera libretto entitled *La Mare au Diable*, and that Mdlle. Pauline Viardot-Garcia will set it to music.

WAGNER is about to recruit his strength, after his arduous labours at Bayreuth, by a journey to Italy, and will visit Bologna to be present at the first production of his *Rienzi* in that city.

SATURDAY, SEPTEMBER 30, 1876.

No. 230, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Lectures on the History of the Jewish Church.

By A. P. Stanley, D.D., Dean of Westminster. Third Series. From the Captivity to the Christian Era; with Two Maps. (London: John Murray, 1876.)

THIS, like the two previous series, is based on lectures delivered at Oxford, but the additions are necessarily large. A fourth volume will be required to carry on the history to its natural termination, at the destruction of Jerusalem by Titus.

"To conclude that history without embracing the crowning scenes and characters of its close would be as unjust to the Jewish race itself as it would be derogatory to the consummation which gives to this preparatory period, not indeed its only, but unquestionably its chief attraction, as a period of preparation for the momentous epoch which involves at once the close of the Jewish Commonwealth and the birth of Christendom."

The amount of previous historical investigation obviates the necessity of a renewed discussion on many points. The author's object has been rather to draw out the permanent lessons of the story, as the Chosen People pass successively under Babylonian, Persian, Greek, and Roman rule; and it is to this aspect of the work that we purpose to direct attention. Part of our abstract will be in the author's own words.

The first part, on "The Exiles at Babylon," is one of the most attractive portions of the book. After the seclusion of a thousand years, the race of Israel was again carried into the great open stream of the world's history, never again to be separated from it. It influences and is influenced by each of the nations which rule it in turn. From Israel the heathen king learns to bow before the King of Heaven, "whose works are truth, and whose ways judgment." In Israel, though the Captivity lasted for little more than a single generation, it sowed the seeds of a change deeper almost than any that had occurred since the departure out of Egypt. The nation, as it brooded over the past, began to learn the lesson of its history. Its annals were put together and continued probably in the same way as the Anglo-Saxon Chronicle was compiled by nameless writers at Winchester or at Peterborough. The great idea of the Unity of God had at length brought the people into unity, and the loss of their native land had broken the fascination of the idolatry of Canaan. The people now found the ideal of their religion in their first father, Abraham, who had been called out from this very land, that by patiently enduring he might obtain the promise. They too had the promise of restoration,

which consoled them in their misery. It is this feeling that makes the Psalms which express, and the prophecies which console, the sorrows of the exiles, capable of such wide application.

"It is, if one may so say, the expression of the Divine condescension to all those feelings of loneliness, of desolation, of craving after sympathy, which are the peculiar and perpetual lot of some, but to which all are liable from time to time. Even the Anointed, the Chosen of the Eternal, now appears in prophecy as a servant deeply afflicted, smitten of God, a man of sorrows, and acquainted with grief."

The middle period of their history seems to fade away. Like the Christian world in the sixteenth century, they look back over the whole of the Middle Ages to the primitive times of pure faith in the True God. Nowhere is there a bolder invocation of reason against the external form of religion than in the solemn yet disdainful appeal made by the Evangelical Prophet to the common sense of those who make to themselves a sacred image: detailing the whole process of its manufacture, and closing with the indignant question, Is there not a lie in my right hand? With the conviction of there being but One True God naturally sprang up a strong sense of individual responsibility, while the destruction of the Temple worship threw the people back on their own hearts and consciences: "The soul that sinneth, it shall die." "The soul that doeth righteously, it shall live." The grandeur of solitary virtue is nowhere brought out so strongly as in the narratives of the Book of Daniel. Here, too, prayer literally takes the place of the morning and evening sacrifice. Now, also, the fast of the true religion is shown to consist in the moral duties of giving food to the hungry and freedom to the slave. Even the son of the stranger was no longer to say that the Eternal had utterly separated him from His people. And even more, in the vision of the Four Empires we have the first scheme of general history, the first perception of the continuous succession of the Ages according to a divine plan working to a fore-known end. In Daniel, as in the Evangelical Prophet, the coming contact of East and West is foreshadowed. A note here points out that though the Book of Daniel dates from Maccabean times, it contains traditions of the Captivity, and on page 12 an additional instance of the retention of local Chaldean colour is pointed out; though the exactness of some allusions does not prove its early composition, any more than the use of unquestionably ancient traditions and narratives precludes the unquestionably Macedonian date of the Books of Chronicles.

After a vivid description of the Fall of Babylon, we pass to the Return from the Captivity under the decree of Cyrus, after which the fortunes of the nation become closely united with those of its Persian rulers. This change was transfigured in the language of the prophet into the vision which has never since died out of the hopes of mankind, that the mighty powers of the earth, instead of standing, as hitherto, apart from the course of religion and progress, would combine with that hitherto isolated movement: "The nations shall come to thy

light, and kings to the brightness of thy rising," "The nations shall see thy righteousness, and all kings thy glory." The Holy Land had now shrunk to a small space, and the name of Israel gave way to that of Judæan or Jew, so full of praise and of reproach, which St. Paul tries to restore to its etymological meaning when he says that the true Jew is he "whose praise is of God." Jerusalem now becomes "the Holy City;" all the other sacred shrines had been swept away. (The Dean here quotes the "Kadytis" of Herodotus, but has not this been more recently identified with "Gaza"?) The tendency to an enlarged view, was, however, now partly counteracted by the strong Puritan spirit of the exiles, and by the restoration of the Jewish ritual under the energetic rule of Ezra and Nehemiah; to support the expense of which Nehemiah charged every Jew with that payment of tribute money which the receivers demanded from Christ at Capernaum. Nehemiah, too, is said to have formed a library of the books of the past times—namely, of "the Books of the Kings and Prophets, those which bore the name of David, and the Royal Letters concerning sacred offerings" (2 Macc. ii. 13). But the Canon was not yet in being. "The Law" was then "the Bible," and it was the Pentateuch only, with the Book of Joshua appended, which a fugitive priest carried with him to Samaria. Ezra, the scribe, begins the series of religious teachers, and the English martyr in the sixteenth century could find no fitter words to express the permanent triumph of his cause than those which in the Apocryphal Book of Esdras are spoken in reference to the ideal scribe, the ideal Reformer of Israel:—"I shall light a candle of understanding in thine heart which shall not be put out." And as Ezra and Nehemiah represent the scholastic and secular aspects of the epoch, so does Malachi the prophetic, his very name indicating the prophecy of "the Messenger" of the Lord who should renew the covenant with Israel, and be to the people like a refiner's fire. The influence of the Persian religion at this time over the Jewish has been much exaggerated. There was certainly an affinity between the two monotheistic religions, but the Persian view of the Evil Principle is expressly contrary to the Jewish creed: "I form the light and create darkness. I make peace and create evil. I, the Eternal, do all these things." The direct borrowing is found in details, and in such names as that of the demon Asmodeus in the Book of Tobit.

At this point comes in an account of the great Eastern sages, whose teaching has been supposed to have influenced, or to have been influenced by, the one true religion—as when Prideaux, acknowledging the likeness of Zoroaster's theology to that of the Old Testament, felt driven to the theory that he must have been the pupil of Daniel. Next comes a full account of Socrates, inserted as an introduction to the Greek period, and a preparation for the account of the Jewish schools at Alexandria. There, under the patronage of the royal house, the Bible was translated into Greek—which was by some regarded as a great calamity, by others as a

means of spreading the truth: the same feelings prevailed when Jerome made his Latin version, and when the Reformers translated the Bible into English; but in all three cases the new easily took the place of the old; the same reverence was transferred to the new version, around which the halo of legend soon gathered. It was this Greek version which was the Bible of the Evangelists and Apostles, the use of the universal language of the civilised world more than compensating for many acknowledged mistakes. The Dean notes here the curious alteration of the original in the famous passages which class the hare among the unclean animals because of the appearance of rumination, and the use of Aristotle's term *dasypous* instead of the old word *lagos*. And as to the Greek Apocryphal books, which now began to take a quasi-canonical place, he quotes an affecting passage from John Bunyan's autobiography, which tells how he was comforted by the words of Ecclesiasticus: "Look at the generations of old and see; did ever any trust in the Lord and was confounded?" though perplexed at the same time by not finding them in his Bible. The interest of the book is much increased by the instructive illustrations which the Dean gives from later Church history. Its true value lies in the spirit in which it is written, and that value is not affected by differences of opinion about this or that detail. We would here refer to the notices in the preface of the merits of Pridaux's *Connection*, and to the tribute paid to Ewald's *History of the Jewish People*.

"It is now more than thirty years since I, with a dear friend, sought Ewald out, and introduced ourselves to him as young Oxford students, in an inn at Dresden; and it is impossible to forget the effect produced upon us by finding the keen interest which this secluded scholar, as we had supposed, took in the moral and social condition of our country; the noble enthusiasm with which this dangerous heretic, as he was regarded in England, grasped the small Greek Testament which he had in his hand as we entered, and said:—'In this little book is contained all the wisdom of the world.' Anyone who has watched the progress of his written words can easily understand what was once said of him to me by a German Professor who had attended his lectures, that to listen to him after the harsh and dry instructions of ordinary teachers was like passing from the dust and turmoil of the street into the depth and grandeur of an ancient cathedral."

Next comes the struggle of the Maccabees against the apparently overwhelming power of Antiochus Epiphanes; and here the summary at the end of the chapter points out the elevation of religion by the patriotic spirit of the family of the Deliverer. Mattathias rejected the precepts of the scribes about the Sabbath, and decided that self-defence was lawful on that day. It was recognised that there was something better and more enduring than Temple or sacrifice. "God did not choose the people for the place's sake, but the place for the people's sake" (2 Macc. v. 19). But the more fanatical party now naturally began to take its own way. It probably deserted Judas Maccabaeus at the crisis of his fate, and his name is almost entirely disregarded in the traditions of the Talmudic schools. His canonisation came from the popular voice and the judgment of posterity, which does

not err in its decision as to the patriots who said "We fight for our lives and our laws;" "Let us die manfully for our brethren and not stain our honour." From this time we begin to trace the growth of the later sects. And from this time, too, the belief in immortality assumes a prominence which it never had before. The Psalter of Solomon says that "Whoso fear the Lord shall rise to eternal life, and their life is in the light of the Lord and shall no longer fail." In the memorable story of the mother and her seven sons who were tortured to death, it is said they trusted that "the King of the world would raise up them who had died for His laws unto everlasting life." These passages, it is true, are not in the Canon, which was closed about this time, Chronicles being the last book, continuing the priestly and royal lines down to the contemporaries of Alexander the Great. When our Lord spoke of all the righteous blood shed upon the earth from the blood of Abel to the blood of Zacharias, the words meant all from the first record in Genesis to the last in Chronicles. The Septuagint arranged the books differently, according to their subjects and chronology, while our present order is a compromise between the two.

The lectures conclude with the Roman period, from the death of Judas Maccabaeus to the death of Herod. All this part of ancient history has quite a modern character. The religious feuds of the Jews are carried on with the same motives and passions as those which animate divisions in the State. But there were higher spirits who, though nominally belonging to one side or the other, rose above the miserable littlenesses of party. Such was Jesus the son of Sirach, whose solemn and emphatic reiterations of the power of the human will and the grandeur of human duty helped to fill up the void left by his total silence as to a hope beyond the grave. Such was Simon the brother of Jannaens' Queen, Alexandra, who established schools in the towns. "Our principal care," says Josephus, "is to educate our children." "The world," so runs the saying in the Talmud, "is preserved by the breath of the children in the schools." The Jewish Church was able to contain the Sadducee, who could find in the Ancient Law no ground for hope of a future life; the Pharisee, who leaned to oral traditions even above the written Law, and believed in angels and spirits; and even the Essene, who took part in none of the ceremonial ordinances, unless it were that of ablution, and made a common meal his religious communion, but was described by the Pharisee historian as the purest and holiest of men.

"Such a latitude in the National Church of the Chosen People, startling as it seems, must have accustomed the first propagators of Christianity to a comprehension which to all their successors has seemed almost impracticable. When Paul felt that the Corinthian Church could embrace even those who received and those who doubted the Resurrection of the Dead, he knew that it was no larger admission than had been made by the Jewish Church when it included both Pharisees and Sadducees; and when he entreated the Roman Church to acknowledge as brothers both those who received and those who rejected the Jewish ordinances, it was in principle the same

Catholicity which had induced both Pharisee and Sadducee to recognise the idealising worship of the Essene."

The true hope of the nation, however, lay not so much in the schools from which Hillel and Gamaliel sprang, as in the elements of spiritual life scattered over the whole country, where many were waiting for the consolation of Israel. In the irreligious age before the rise of the Maccabees many Jews had taken Greek names—Jehoia-kim was called Alcimus, Joshua was known as Jason. But now we again meet with such names as Jacob and Joseph—names which show the revival of religious feeling and the recurrence to the feelings of the earlier age. Throughout the country, too, in town and village, had sprung up a whole system of worship which to the Pentateuch and the Prophets and the early Psalmists was unknown. The main religious instruction and devotion of the nation were now carried on, not in the Temple, but in the synagogues. Wherever there were as many as ten who desired it such a meeting-house for prayer was established. No office of teaching corresponding either to that of the Jewish priesthood or that of the Christian clergy existed in this body; the instruction was given by any scholar or any of the brethren who had a word of exhortation for the people. The practice of combining the office of teachers with some manual trade was a constant safeguard against their sinking into a merely sacerdotal or a merely literary class. Such meetings existed all over the world, and from their order and worship naturally sprang those of the first Christian communities. Here was the opportunity for any fresh teaching to arise within the existing framework of the Church. The want of the synagogue system had been felt under the monarchy, for the rare visits to the Temple were not sufficient for their purpose. But as some think that the doctrine of immortality had become so much mixed up in Egypt with Pagan theories that it was necessary to withdraw it into the background in the Law; so the necessity of maintaining unity in worship had concentrated all devotion at one religious centre, although there was the danger that the felt need of local worship might for a time lead men to alien altars at the high places. But now both dangers had disappeared, and the local worship and the hope of a future life resumed their rightful place. Hence all was prepared for the coming change, the elements of a universal system which existed in Judaism were ready for the new combination.

"The ideal of a spiritual religion was constantly preserved, and, even within the strictest circle of Judaism, kept the door open for the entrance of a wider teaching, and a deeper thinking, and a higher living, than any which had hitherto been recognised as Divine. And the greater diversity of elements which, outside the pale of Judaism, appeared to foreshadow or contribute towards this ideal, so much the larger was the horizon which such a character would fill, if ever it should appear."

The abstract we have given will supply some idea of the spirit and purport of these instructive lectures, which, "begun at Oxford, have been resumed during the leisure of an enforced seclusion, under the

impulse of an encouragement which overbore all obstacles, in the hope of finding relief from an anxiety which forbade all external occupations." C. W. BOASE.

Morocco and the Moors: Being an Account of Travels, with a General Description of the Country and its People. By Arthur Leared, M.D. Oxon., F.R.C.P., &c., &c. With Illustrations. (London: Sampson Low & Co., 1876.)

DR. LEARED'S work, the result of a tour in the western portion of the empire of Morocco in the autumn of 1872, is superior to the majority of books of travels which in these days issue in such numbers from the press. He tells us in his preface that he prefers a plain narrative, such as is found in the works of the older travellers, and that his readers will find an entire absence of smart writing; he keeps his word, and we are grateful to him, especially as he is never dull, but gives a complete and graphic account of a country little known, in a pleasant and lively style.

More than thirty years ago Sir John H. Drummond Hay delighted the reading public with his charming work, *Western Barbary*, which threw a halo of romance over a people whom Dr. Leared sets before us in sober truth. The Moors of Morocco are descended from a common stock, and attained to as high a civilisation as those who conquered Spain; indeed, the Spanish Moors were in the habit of sending children to Morocco for education. Of this civilisation and learning not a trace remains. Even as long ago as the early part of the sixteenth century, the city of Morocco had fallen into great decay, and little more than barbarism and misery prevailed. Who can doubt that had the Moors remained masters of Spain, their civilisation, brilliant, indeed, but evanescent, would have met the same fate, and that the race would have sunk as low as their brethren at Morocco, Bagdad, and Damascus?

That the Moors of Morocco will ever by their own efforts rise again may be safely pronounced impossible; European civilisation may, in the course of time, obtain a footing in the empire, and as it advances the Moors will recede. The region which lies between the Atlas mountains and the sea is so fertile and possesses so fine a climate that it seems impossible it can much longer be left in the hands of a people who barely use it, and whose numbers, we have reason to believe, diminish. The cultivation, as described by Dr. Leared, is of the lowest possible order, and, in spite of every bounty of nature, famines are not unfrequent.

Tangier, which not two centuries ago was in the possession of England, is the first point in Morocco touched at by our author; between it and Gibraltar constant communication is kept up, and it is furnished with hotels and boarding-houses; the climate is so equable and pleasant that it seems likely in time to become as favourite a resort for invalids as Algiers. After making some expeditions in the neighbourhood of Tangier, Dr. Leared went by sea to Mogador, touching at Casa Blanca and Mazagan. The coast of Morocco is well

known, but the interior is in great part untrodden by Europeans, and the number who have entered the city of Morocco is easily counted. The reason for this is not far to seek: travelling is not only difficult but dangerous, and the Moors, who in civilisation are behind their brethren in the East, far surpass them in lawlessness and in their fanatical hatred of the unbeliever.

From Mogador Dr. Leared turned inland to the city of Morocco, and most unfortunate was he in the time he selected for his journey. The Sultan was away, engaged in hostilities with some insurgent subjects, and the inhabitants of the town, on receiving news that he had experienced reverses, broke out into open revolt; there was no authority to repress the savage hatred they entertained against Christians, and Dr. Leared and his party were in constant alarm for their own lives. Under these circumstances, their thoughts naturally turned to a retreat. They had only been three days in the town, when an attempt was made to poison them in the oil in which the fowls served for their dinner were stewed; happily no worse results followed than an illness of two days, but this treachery made it absolutely necessary for their safety to depart, and they left the city October 10, having entered it on the 4th. We can well sympathise with the vexation felt by Dr. Leared at being obliged to turn his back on the glorious Atlas range, then in full view, and mainly unexplored. He had, however, in spite of so many difficulties, seen all that was worth seeing in the city of Morocco, which, in common with most Mohammedan towns, presents a picture of filth, squalor, and decay—of misery and oppression.

From the town of Morocco the author proceeded to Saffi, on the coast. On the way he halted at the residence of the governor of Bled Ahmar, who provided—

"a dainty for breakfast which we failed to appreciate. This was old unsalted butter. We did not even taste it, for the smell was enough. The men, however, did not copy our abstinence, but ate voraciously, and pronounced it to be of rare quality. Butter in Morocco is estimated according to age, as wine is by ourselves, and this in question was, we were assured, a year old."

Dr. Leared's tour occupies little more than half his book; the rest consists of valuable chapters on the government, laws, education, religion, customs, and agriculture of the Moors. They differ little from other Oriental nations (if we may without a bull include among the Orientals a people whose territory extends to the eleventh degree of west longitude), except in being somewhat lower in the scale. Strange to say, tea with the Moors takes the place of coffee. We cannot resist quoting our author's humorous account of a tea-party in Morocco:—

"The tea is washed before it is infused, and a great quantity of sugar is put into the tea-pot. It is, in fact, a syrup; and it might be supposed that people so particular about flavours as are the Moors would find such excessive sweetness objectionable. Yet, what is more extraordinary still, they endeavour apparently to suppress the delicate tea-flavour altogether. There is a regular course of tea impregnated with different flavours which are all more or less disagreeable to the novice. The order of these may vary; but from the numerous opportunities we had of judging,

the following seemed the rule in 'the best circles.' First, there was a round of plain green tea with no addition but sugar. Milk or cream was never used. Then came a second course, in which spearmint was infused—a horrible compound. Third, an infusion of tea with wormwood, not quite so objectionable. Fourth, one flavoured with lemon verbena. Fifth, one with citron. Sixth, and more rarely, as being an expensive luxury, and intended as a great compliment, tea with a little ambergris scraped into it, and which could be seen floating like grease on the surface. Of this the flavour, if peculiar, was not disagreeable. Each course of tea was taken while very warm, and with a loud smacking noise of the lips; nothing meanwhile was eaten."

We will leave the reader to discover for himself the method in use for fattening young ladies engaged to be married—*embonpoint* being the summit of female beauty in the estimation of Moorish lovers.

Dr. Leared visited the village inhabited by about 200 lepers a little way outside the city of Morocco. Of the plague he tells us that it has been entirely unknown for more than fifty years. "It has certainly not been stamped out by precautions or improved sanitation. It is probably only in abeyance, in obedience to some unknown law." WILLIAM WICKHAM.

MDLLE. DE LESPINASSE.

Lettres de Mlle. de Lespinasse. Revues, etc., par Eugène Asse. (Paris: Charpentier, 1876.)

Lettres de Mlle. de Lespinasse. Par Gustave Isambert. Tome I. (Paris: Lemerre, 1876.)

THERE would be nothing surprising in the coincidence of these two editions of the same work even if we were not in possession of explanations (which have been already given in the ACADEMY) sufficiently establishing their independence. It would probably be difficult for any man of letters specially engaged upon their class and period to abstain from selecting them for republication and comment. For if they do not stand alone they certainly stand at the head of the small group of their fellows. As one reads them with unabating interest it is impossible to avoid wondering at the apparently slender source from which that interest springs. The usual attractions of correspondence are almost entirely absent. There is hardly any contemporary gossip: the references to the famous men with whom the writer was connected are few and far between: a favourable notice or two of Lord Shelburne, some not very enthusiastic allusions to Diderot (had she not forgiven him the *Rêve de D'Alembert*?), a very few remarks on her famous house-mate, and a good many well merited encomiums on Turgot and dubious praises of Loménie de Brienne, almost complete the list. The absence of answers to the letters complicates the difficulty of fully understanding them, and throws the task of sustaining their interest still more entirely on the revelation of the personality of the writer.

Never, perhaps, was revelation more complete. By the time we close the last of these hundred and eighty long letters ("volumes," the writer frequently calls them) we seem to know Mlle. de Lespinasse

as well as if they had been written to ourselves. Not young (she was forty-two when she wrote them), the reverse of beautiful, not rich, of doubtful parentage, "sœur Lespinasse," as "the kirk of the other complexion" called her, must have owed the whole of her vast influence and popularity to moral and intellectual qualities, and these letters show clearly enough what those qualities were. A clear and steady intelligence, an excellent critical faculty, a singular delicacy and refinement, boundless kindness of heart, and unwearied attention to and labour for the interests of all her friends were obviously her portion. Whether the *sensibilité* which the cant of the time recommended to her, and which she managed to assimilate only too thoroughly was a curse or a blessing may be matter of argument, but she certainly seems to have been unfortunate in the selection of its objects.

That D'Alembert himself could ever have been counted among these objects is doubtful, and indeed a practised student of the physiology of amateness would probably decide the vexed question as to the Platonic nature of their friendship in the affirmative on the strength merely of the date and tone of these letters. Passing over a "jeune Irlandais, Sir Taaff," we come to the first great passion, the Marquis de Mora. This gentleman, who appears constantly throughout these letters in a Mrs. Harris fashion which is sufficiently irritating, appears by universal testimony to have been loveable enough. But unfortunately he died, and even before he died his inflammable mistress had supplied the void caused by his absence. His successor, M. de Guibert, to whom this collection of letters was addressed, was a young soldier in quest of glory, as Voltaire put it, "par tous les chemins," and particularly by the road of literature. He had written a book of Tactics which had met with a good deal of applause, and had his pocket full of tragedies destined to a good deal of ridicule. He was, moreover, an occasional competitor for the *Eloge* contests of the Academy, and in these the favour of Mlle. de Lespinasse was almost a guarantee of success. How far the intimacy which followed between the two was on the gentleman's side a mere measure of policy cannot be exactly determined, but that to a great extent it was such a measure is scarcely an uncharitable opinion. Guibert was certainly a coxcomb with a vain head, and a very indifferent heart, and it is almost impossible to conceive a more offensive mixture of rant and cant than his *Eloge d'Eliza*, which M. Asse has very judiciously included in his volume. On the other hand it would be unfair not to credit the fortunate lover with having been, if only temporarily and in some measure, impressed by the passionate ardour of the lady. Of this ardour the hackneyed words that it "burns the paper" give for once a true enough description. In whatever mood the writer may be, and whatever may be the immediate subject which she has in hand—whether she is anxious for the health of her lover or complains mournfully of her own; whether she laments the departed marquis or comments scornfully

on the living D'Alembert, who prefers a Harlequinade to Gluck's *Orpheus*; whether she is arranging a week of dinners and suppers (not forgetting interviews under four eyes) for Guibert or drawing a melancholy picture of herself as "vieille, laide, triste, malade, et abimée dans le malheur," the fiery passion equally unconcealed and unfeigned is always present. As might be expected, the prevailing tone is mournful, and that, too, not merely when insulting or indifferent letters (neither of which appear to have been lacking) might account for it. She asks again the often asked and never yet answered question, "Un regret ne vaut-il donc pas mieux qu'un remords?" She speaks of "cette maladie si lente et si cruelle qu'on nomme la vie." But especially there seems to weigh on her an uneasy feeling at the complaisant indulgence with which, in obedience to Ovid's *dictum* as to elderly lovers, she treats her cavalier adorer. The crowning stroke seems to have been dealt by Guibert's concealment of his matrimonial intentions, and by an unfeeling note ("chef-d'œuvre de froideur et de dureté") in which he at last announced their fulfilment. She does not seem to have objected to his marrying in the abstract; indeed, she proposes one or two matches for him herself, although she candidly tells him that in her opinion "le mariage est un véritable éteignoir de tout ce qui est grand." But she could not pardon the deception, although she managed to put on a semblance of forgiveness. That the blow killed her seems to be the general opinion, though, if her health had really been half as bad as she represents it, a broken heart would seem to be hardly necessary to account for her death.

The two editions of these remarkable letters which have just appeared are both good in different ways. M. Isambert's (of which the first volume only is published) is perhaps the more scholarly of the two. The introduction is better written, and more to the point; the print and paper are more attractive, and some nine or ten unpublished letters are promised. On the other hand, M. Asse has the great advantage of giving the whole in one volume; his appendix of notices of his heroine is exceedingly useful; and his notes are foot-notes, a feature which, if it does not improve the look of the page, is of some importance when the chief points to be illustrated are genealogies of persons casually mentioned. We cannot help murmuring, however, to the announcement by an editor and biographer that he will keep one of the most interesting points in his heroine's career for discussion in a "travail séparé." In such matters as these completeness is of the first importance, and, indeed, may be demanded by the reader as a right.

GEORGE SAINTSBURY.

English Chess Problems. Edited by James Pierce and W. Timbrell Pierce. (London: Longmans & Co., 1876.)

THE invention of chess problems is of almost equal antiquity with the practice of the game, as a Sanskrit collection by Tiruvengadu Chariar dates back, I believe,

to the Middle Ages. In the Indian game even of the present day to mate with a pawn is considered the highest triumph, and consequently in the Sanskrit puzzles mates with this condition are predominant. To mate with a pawn, or to force the opponent to mate your own king with a pawn in from twenty to a hundred moves, forms the staple of those early compositions, and the father of English problem-composers, Bolton, fashioned several of his most laboured positions upon this model. The abandonment of conditions as to mating with a particular pawn or piece, and the construction of a natural position, such as with a little stretch of the imagination might be supposed to have arisen in an actual game, where by an elaborate and ingenious series of moves mate could be forced against every possible defence, was the next step in the art, and in those natural problems, as they may be called, the English composers Bolton and Bone were the most successful. D'Orville and others on the Continent were simultaneously producing positions, unrivalled to this day in elegance of construction, in which by ingenuity of combination, and generally through sacrifice, mate was effected by few pieces against apparently overwhelming forces. With this phase of the art similarity to positions that might arise in actual play was abandoned, length of moves in the solution became barred, and, as the growth of chess magazines and chess columns in newspapers increased the number of problem-composers and problem-solvers, the latter required that solutions should be short and yet difficult; and, in proportion as the skill of practised solvers has increased, the demand for greater difficulty has been met by an amount of ingenuity, inventive power, and laborious care, such as only practised composers are aware is involved in the successful construction of a modern chess problem.

Chess problems form now a totally distinct branch of chess from chess play; a fact strikingly evinced by the list of fifty-four living composers represented in this collection, of whom not more than five can be numbered among known strong players over the board. It is doubtful whether either of the combatants in the late match for the championship, Messrs. Steinitz and Blackburne, ever composed a problem, though the latter as a player is famous for the brilliancy of his combinations. It is now a moot point even whether, in the highest class of chess play, mere power of combination can ever hold its own against deep insight into position: whether a master of the mere tactics can ever successfully oppose a master of the strategy of the game. In his exhibitions of blindfold play against opponents of ordinary strength Mr. Blackburne is in the habit of exhibiting the most brilliant and unexpected moves, which speedily result in victory. But there must almost always be some flaw in the strategy of the antagonist to admit of brilliant combination or tactics coming into play. In most of the games in the recent match there seemed never to arise the opportunity for the exhibition of Mr. Blackburne's peculiar powers; the seventh game of the match might be cited as a perfect

example of Steinitz's well-known style, in which he trusts nothing to combination himself, and gives no opportunity for combination to his adversary. By slow degrees he worked up a position which could not be broken through, and in which as an apparently inevitable conclusion the enemy's game appeared to crumble away and end in hopeless collapse. Against weak play, or when strategy has worked out its end, Steinitz, like every other great player, will make brilliant moves, but his style, more than that of any other master, shows the inherent difference that lies at the bottom of the highest class of chess play and that mere brilliancy of manoeuvre of which problems afford an artificial representation.

Whether chess play or problem composition calls into exercise the higher faculties is a question that need not be decided: the latter branch has probably the greater number of votaries, and apparently possesses a keener fascination. The editors of chess periodicals find it difficult to supply good games for publication, but stores of the most ingenious problems are never lacking. They appear weekly in every chess volume throughout the country, in apparently endless novelty, while a decently contested game in a match between country players will be reproduced in each of those columns *ad nauseam*, as if nothing worth record could be found in all the games played daily in all the clubs throughout England. In truth, games are played for the sake of the struggle, and few players will take the trouble to remember and record a game, while a problem is made solely for the sake of publication. The idea of contest has been imported into even this branch of chess, but the result has not been happy. Problem tournaments have repeatedly taken place, and have generally ended in bickerings, strife, and the most ungenerous imputations. There is probably nothing in the world on the merits of which it is more difficult to find unanimity of opinion than a chess problem. The only quality which admits of certain definition is soundness, and even in this particular the most painstaking judges are liable to fall into the most glaring errors. After a decision has been pronounced, and the prize problems are published, the lynx-eyed public solvers often detect some simple second solution, or other flaw, which, under the rules of the tourney, should have at once shut out the prize problem from the competition. In one important tourney the public had thus twice, for causes shown, to move the Court to reconsider their decision, by twice detecting positive unsoundness in the position selected on a first and second occasion for the highest honours. Apart from the point of soundness, on which publication is the only certain test, opinions on a perfectly sound position depend solely on the idiosyncrasy of the judges; and beauty of form, elegance of construction, novelty of idea, even difficulty of solution, can be determined by no fixed canons. It is the custom in some chess volumes to invite and publish criticism on the problems previously published, and the divergence of opinion between perfectly competent judges is most amusing. What appears a gem of the first water to one person,

the poetry of chess to another, is a wretched production in the opinion of a third, and is set down by a careful critic as not unworthy of its author if it were not disfigured by the most disgraceful duals. Certainly, as regards chess problems, *tot homines tot sententiae*, and if ever problem tourneys be again attempted, he must be a bold man who would accept a place among the judges, with the anticipation, after recent experiences, that German chess-editors, on behalf of unsuccessful competitors, will not only prove him to be a fool, but will cast the gravest imputations upon his honour. Wonderful are the amenities of chess literature! According to our leading authorities, the judges in the highest chess-tourneys are actuated by unfair and sordid motives, and our leading players are accustomed to sweep pawns off the board with their sleeve!

Considering the increasing body of the public who devote themselves to chess problems, the present collection should be a great success. The first and by far the most important portion of the book contains more than five hundred positions, selected by the best living English composers out of their works as those by which they would wish to be represented in a permanent memorial of their art. They have all gone through the test of publication, and are consequently error-proof, and I believe it would be impossible in any work to find a collection of so many first-rate chess problems. The second portion, which contains specimens of the works of dead English composers, is neither so complete nor so satisfactory. There are only three positions by Bone, and, while Bolton is better represented, it would have been possible to make a fuller collection of the works of the father of English composers from the early volumes of the *Chess Players' Chronicle*. It is the fashion now to reject lengthy problems. To the chess player, I assert, Problems 531, by Bolton, in twenty-four moves, and 534, by Bone, in twenty moves, are more like real chess, give more interest, and are far more easy of solution, than some of even the two-move problems by their successors. As a mere matter of length, there are several four-move problems in this collection which involve more moves in the solution than either of the above. Problem 351 contains eight different variations, each of four moves, and as the first move or two is apparently aimless, it would seem impossible for any one not possessed of Job's proverbial patience to find out the correct solution. To the tyro unversed in these subtleties, I may offer a hint that may sometimes help him to hit off the *modus operandi*. Let him imagine what at first sight would appear the most unlikely move to be made, and he may thus perhaps hit upon the key of the mystery. I must candidly confess myself to be destitute of the necessary patience required from a problem-solver; perhaps, in consequence, I am unfitted for the task of properly criticising such a work as this. I have, however, glanced through some of the two-movers in the collection, and am confident that any chess amateur will be astonished at the amount of ingenuity of conception, patience in working out the desired end, and resulting beauty of surprise, to be found in these

puzzles, which constitute, after all, but a manufactured imitation of chess skill.

JAMES INNES MINCHIN.

BICKNELL'S HÁFIZ.

Háfiz of Shiráz; Selections from his Poems, Translated from the Persian. By Herman Bicknell. (London: Trübner & Co., 1875.)

AMONG the last generation of Orientalists were such men as Falconer, Sir William Jones, Nott, Hindley, Bland, and others, who devoted their time and talents to the rendering of Persian Poetry into English verse; and the results of their labours, published either in separate volumes of selections or in the pages of the *Asiatic Miscellany*, enjoyed for a long time considerable popularity. The translations of Falconer, especially, are among some of the most beautiful in the English language, and have fallen into most undeserved neglect. These productions served to introduce to the English reader some of the choicest flowers of the Persian anthology, and the fame of Háfiz, the national lyric poet of Persia, thus began to be celebrated in this country. For some reason or another, the taste died out; and, although the works of Háfiz continued to be spoken of with admiration, they remained, almost until the present day, absolutely unknown here. In Germany the entire *Diván*, or collected edition of the poet's works, has been several times translated—first by that voluminous Orientalist Von Hammer, and later by Rosenzweig, of Vienna, and Nesselmann, of Berlin; but until the appearance of the volume before us no attempt has been made to produce an edition of Háfiz for English readers.

The present book is therefore welcome, as supplying a long-felt desideratum; but it is after all merely a selection from Háfiz's works, and there yet remains much to be done. It is magnificently got up, illustrated by several exquisite chromolithographic facsimiles of water-colours by J. Herbert, R.A., and contains some well-executed woodcut vignettes.

The translations themselves are for the most part scrupulously correct, and, although they lack the flow and poetic grace of the original (which was perhaps inevitable when such a master of language and rhythm had to be dealt with), they give a very good idea of the general tenor and style of the poems.

Of the life of Háfiz little is known: in fact, it was essentially a literary and contemplative life, and therefore necessarily wanting in stirring incidents. He was a contemporary of Dante, and was born at Shiráz in the fourteenth century of our era. He adopted at an early age the career of a Dervish, a Mohammedan monkish order professing certain mystical doctrines called *tasawwuf*, or Sufism; but, although he remained a member of the order all his lifetime, he by no means adhered to the rigid principles of asceticism which his fellow-dervishes assumed, and he constantly asserts throughout his poems that these latter were no better than himself:—

"A wine-drinker am I, to giddiness prone, whose glances and manners are free.

And where among those who inhabit this town is one that resembles not me?

Withhold from the Muhtasib's knowledge, I pray,
the story of error like mine;
He also, with ardour that equals my own, unceasingly
searches for wine."

The question has long remained undecided whether Háfiz is to be considered as a purely Sufiistic, theosophic, mystic poet, or merely an Anacreontic *bon-vivant*. There is, in my opinion, no need to join issue on the point at all. Háfiz' early training and life-long profession was that of a Sufi dervish, but he was at the same time emphatically a *bon-vivant*, and beyond all his countrymen a lover of nature and of the beautiful wherever found. Unquestionably his Anacreontic utterances are real: the wine of which he speaks with such gusto, and the fair faces which he celebrates with such heartfelt admiration, are no empty allegories, but real memories or experiences; yet it is equally indisputable that his Sufi tendencies led him to give the necessary mystic turn to each verse and phrase, and the only difference between him and his brother Sufi poets is that, while they drew upon their imaginations for such similes, he had the courage to go direct to the sources of inspiration for them. His free living and free thinking drew down upon him, as might be expected, much odium, and, as the translator tells us in his preface,

"On account of the supposed heterodoxy of certain passages in his *Diván*, difficulties were raised as to the interment of Háfiz with the rites of religion. The poetic oracle,* however, being consulted, all doubts were removed by the following couplet:—

Wish not to turn thy foot away from Háfiz on his bier;

He shall ascend to Paradise, though steeped in sin while here."

But whether Háfiz was a real or pretended Sufi, it is quite certain that without some knowledge of the metaphysical tenets of this mystical sect much of the spirit of his poetry must remain obscure to the reader. The late Mr. Bicknell's notes contain just enough Sufism to put the reader *au courant* with the mystical interpretation adopted in the East, and leave him free to form his own judgment as to its application to individual passages. The summary of the Sufiistical tenets given in the introduction is also lucid and concise:—

"The Koran, the Vedantas, the Zendavesta, and the Bible have all been found unable to meet the exigencies of Law and Morality without amplifications on the part of expositors; moreover, men of lofty imaginations have in all ages been prone to invent mystical and ascetic theories to satisfy their own ardent temperaments. Hence in Islám the many sects of Dervishes, who have grafted on Mohammedanism doctrines similar to those which existed in India and elsewhere before the birth of the Arabian Prophet. Although Muhammed is related to have said: 'There is no monachism in Islám,' it appeared among his followers immediately after his death. One of the earliest Sufis was Rabíah, a holy woman, spoken of by the Arabian biographer Ibn Khalikan. We read of her that at dead of night she used to go out upon the roof of her dwelling and exclaim: 'Oh my God! the noise of day is hushed, the lover is with his beloved, but I have Thee for my lover, and I rejoice with Thee in solitude.' The Sufis represented by various bodies of Dervishes,

are still very numerous. Most of them teach that the soul is an emanation from the Divine essence, and that on earth it is in a state of exile from the Supreme Good."

I cannot help thinking that the translator has made a great mistake in attempting to follow the metre of the original. There are some Persian metres which are capable of being so rendered, but as a rule the movement of Oriental verse is so different from that of European poetry that it is almost impossible to represent one by the other. The method can only be pursued by mechanically rendering the verse syllable by syllable in English, and the inevitable result of such a process is to dull one's musical appreciation of the rhythm, and, by fettering the thought, to double the chance of inaccuracy even in the translation. Take, for instance, the concluding stanza of the first ode, which is translated as follows:—

"If joy be thy desire, O Háfiz,
From Him far-distant never dwell;
As soon as thou hast found thy loved one
Bid to the world a last farewell."

Here we have an example of all the faults of the present version: *húzúrí* does not mean "joy" but "presence," and the Arabic hemistich which forms the last half of the couplet is wrongly translated. The literal rendering of the verse is as follows:—
"If thou wishest for His presence do not be absent [or hide thyself] from Him.
'When thou wouldst meet him whom thou lovest, leave the world alone and postpone it'—i.e. postpone all consideration of it till thy wish be obtained. Metrically the verse is also faulty; the *ictus*, or rhythmic accent, falls upon the subordinate words "thy" in the first line, "thou" in the third, and "to" in the last line; nor does it even represent the original Persian rhythm:—

"húzúrí gar | hamí khāhí ||
If joy be thy desire (O) Háfiz
Az ū ghā'ib | mā shāv Háfiz ||
From Him far dis tant never dwell
Matá mā tal | ka mán tah wā ||
As soon as thou hast found thy loved (one)
Da' id dun yā | wa āmbillā ||
Bid to the world a last farewell."

Here the "O" in the first and the "one" in the third lines are superfluous and spoil the rhythm.

As an instance of similar slight inaccuracies in the translation and inelegances in the English verse, we may take the verse:—

"To bliss' goal we gain not access, if sorrow has
been tasted not;
Yea, with Alastu's pact was coupled the sentence
of our baleful lot."

To which is appended the following note:—

"It is maintained by certain interpreters of the Koran that Adam and the whole of his future race appeared before their Creator on the first day of the world. God said to them: *Alastu bi Rab-bikum*, 'Am I not your Lord?' All responded, '*Balá*,' 'yes.' But the word *balá* has the additional signification of 'bale' or 'evil.' Hence the sentence of 'bale' or 'evil' was annexed to the pact of the 'day of Alast,' and was constituted a condition of existence."

The translation of the verse is really as follows:—

"The station of pleasure is not attainable without pain:
They must have employed *balá* (with *yá*) 'yes' in
the sense of *balá* (with *alif*) 'misfortune' on
the Day of Alast!"

So far from the word *balá*, "yes," also meaning "bale or evil," it is quite a distinct word, and is derived from a different root; nor does the Sufi doctrine confuse the two meanings. But the whole point of the verse is the new turn given to the word *balá* by the poet in this punning view of it. The apocopated genitive in "bliss' goal," and the inversion in "tasted not," are uncomfortable enough without the preposterous insinuation of an etymological connexion between the Arabic *balá* and the English "bale."

The only way satisfactorily to render Oriental poetry into English verse is first to choose an *English* metre of which the movement is similar to the original, and then to render that original phrase for phrase, not word for word, into such metre. The genius of the two languages is so different that rigid adherence to the words of the Persian absolutely fails to convey the meaning. The phrases *Alwál i sheríf che túr ast?* "How is your noble constitution?" *Al hamdu lilláh az lutf i shumá*, "Praise be to God from your kindness," simply represent to an Oriental ear the commonplace question and answer, "How do you do?" "Quite well, thank you;" and to render what is not quaint or stilted in Persian by what is quaint or stilted in English obviously fails to convey the exact impression of the original. Similarly a metre which is perfectly familiar to Persian ears cannot be faithfully rendered by one which is unfamiliar to English ears; and I cannot help thinking that whatever faults may occur in the otherwise excellent version before us are entirely due to the fetters imposed upon himself by the translator in having chosen servilely to imitate throughout the metres in which Háfiz wrote.

Both Persian and English are Aryan languages, and therefore some metres in the former may be successfully imitated; but as a rule they are too far removed from our own system, too exuberant, and above all too widely divergent in movement. As a specimen of the more successful imitations, we may take the well-known Persian song *táza ba táza nan ba nan*, which although not by Háfiz of Shiraz, is almost always included in his *Diván*, and is certainly typical enough to be included in the present selections:—

"Sing me a lay sweet bard, I sue; once and again,
anew, anew!
Seek for me wine's heart-opening dew; once and
again, anew, anew!"

Close to some sweet and doll-like fair, sit thou apart
with cheerful air:
Steal from that cheek the kiss that's due; once and
again, anew, anew!"

Sáki, who steps with silvery limb, now has recrossed
my threshold's rim:
He shall my cup with wine imbrue; once and again,
anew, anew!"

How shall life's fruit by thee be won, if thou the
wine-filled goblet shun?
Quaff: and in thought thy loved one view; once
and again, anew, anew!"

Ravishing-hearts, the friend I choose, eager to please
me well doth use
Gauds and adornments, scent and hue; once and
again, anew, anew!"

Breeze of the morn that soon shall fleet
Hence to that Peri's blissful street,
Tell thou the tale of Háfiz true;
Once and again, anew, anew!"

* The works of Háfiz are still used for purposes of divination, after the fashion of the *sortes Virgilianae*.

Among the fragments which form the latter portion of the volume are a few passages of historical interest; some of these are in Háfiz's best style, and are translated much more successfully than the lyrical odes themselves, the version being free from the stiffness and peculiarity of expression which marks the rendering of the latter. The following, for example, is a really fine epic passage, in which is described the blinding of Sháh Mansúr by his rebellious son:—

"Let not thy heart the World's vain goods pursue,
For no one yet has found her promise true.
No stingless honey in her mart we buy,
No thornless dates her garden will supply.
If lamp she lights, as soon as it grows bright
The wind extinguisheth the spreading light.
Who careless doth his heart on her bestow,
Behold, he cherishes a deadly foe:
The warlike King, who made the earth his prey,
His sabre dripping from the bloody fray,
Who with one onset put a host to rout,
Or broke a centre with a single shout,
Who chiefs unjustly into prison threw,
Beholding heroes when no crime they knew,
Who made the lioness untimely bear
In deserts, when his name but sounded there,
Who made Shiráz, Tabriz, 'Irak, obey—
Succumbed at last on his appointed day:
For one who his world-scanning eye made bright
With stabbing awl destroyed that piercing sight."

Each of the odes has prefixed to it the first line of the original, so that the Persian scholar can easily identify and turn to the *ghazul* translated. The scholar, however, hardly requires such help, and the formidable array of Persian quotations must prove rather deterrent to the ordinary reader. A less technical and more popular translation embracing a larger portion of the *Diván* would have appealed much more forcibly to the English public. As it is, however, the volume before us is a most acceptable contribution to our literature, and is so unlike the ordinary run of such works that it can hardly fail to influence beneficially the poetical taste of the day. E. H. PALMER.

Marie de Médicis dans les Pays-Bas, 1631–1638. Par P. Henrard. [*Annales de l'Académie d'Archéologie de Belgique.* 3^e Série, T. I.] (Anvers, 1875.)

MARIE DE MEDICIS is not a promising subject. The woes of a great lady driven into exile because she is not allowed to misgovern some millions of men are undeserving of serious compassion beyond the pity for human ignorance and weakness which is due even to the most misguided. It is, therefore, with a pleasant surprise that the readers of M. Henrard's work will find that the Queen-Mother of France has been thrust into the background, and that the writer has given us something much more interesting than he led us to suspect—a sketch of his country's history during the crisis which at one time seemed likely to liberate it from the destiny which chained it to the Spanish monarchy till the bonds were cleft asunder by the sword of Marlborough.

It is probable that few people in England have any idea of the importance of the Spanish Netherlands to Western Europe during these years. From 1628 to 1632 one frontier fortress after another fell into the hands of the Dutch. The Spanish armies appeared to be entirely unable to protect these regions, and while the sword of the

Prince of Orange was cutting its way more deeply every year into the heart of the country from the north Richelieu was watching his opportunity to claim a portion of the spoil in the south. Nowhere were these events watched with more increasing alarm than at the English Court. The vast extension of the Dutch maritime power was looked on with suspicion by Charles I. and his ministers, while the prospect of the conversion of Dunkirk into a French stronghold was even more repulsive. The interests of England undoubtedly required the maintenance of an independent Belgium. Was it possible to conciliate this interest with the general interests of the European community and with the particular interests of the inhabitants of the Spanish Netherlands?

In England two views prevailed among serious statesmen. Sir Thomas Roe held that England never ought, under any circumstances, to support the hard and despotic Government of Spain. But neither ought she to assist the ambition of France. He acknowledged that the Dutch would be dangerous neighbours if they became too strong; but he thought that a United Netherlands with France for an immediate neighbour would always be desirous of keeping on good terms with England. Roe's policy, in short, was the policy of 1814.

To this Weston opposed the policy of 1830. When the States General met at Brussels in 1632 some of its members made overtures to Charles to assist them in constituting themselves into an independent State. It was not Charles's way to do anything openly, and the manner in which he dealt with these overtures deserves all that has been said about his conduct in the matter. But the thing which was aimed at was so much the best for all that it is very satisfactory to learn from M. Henrard what were the real chances of the success of such a policy if it had been in better hands.

M. Henrard has had at his disposal, not only the documents contained in the archives of his own kingdom, but a collection of most valuable transcripts from Simancas which had been made for the Comte de Villermont. It is to be regretted that one who knows how to use his materials so well did not pay a visit to London to study Gerbier's letters in the Public Record Office.

M. Henrard's account of the matter, in short, is that, while the natives of the Spanish Netherlands distrusted the Dutch and the French, they had not sufficient cohesion or self-confidence to form themselves into a nation. Each province looked with neighbourly jealousy upon the others, and the promise of 1632 was thus thrown away because there was no national bond of union. Only in the Spanish Government could any centre of action be found, and they preferred submitting to be led captive by Spain and sacrificed to foreign objects to the risks of an independence which might end in submission to their neighbours to the north and the south. The spur of religion, which was so powerful with the men of the sixteenth century, was wanting in the seventeenth.

The most interesting part of M. Henrard's book is the contrast which he draws between the condition of France and the Spanish

Netherlands, altogether in favour of the latter. The central Government at Brussels was thoroughly despotic. But provincial and municipal freedom had not been blotted out. The inhabitant of Brussels or Ghent looked down with contempt and disgust upon the libertinage of the French nobility, and he had no fancy for incorporation with a people with whom a long pedigree counted for more than years of honest service. Above all, justice was better administered at Brussels than in Paris. What would a grand French gentleman think, says a writer of the time, to find himself called to account for slight faults "par un petit cadet qui ne sera pas peut-être gentilhomme"? What would a French magistrate think, if he found that offices were not for sale? Those who wonder how it is that Belgium came to be what it was in 1830, and how it is that France has plunged from one adventure into another will do well to study this book of M. Henrard. History has no surprises except for ignorance.

Space will only permit a reference to one or two points of personal interest. Once more we are brought face to face with Olivares. If ever there was a tragedy in real life it was his. Steering the Spanish monarchy to ruin, he has a clear preception of the danger. He knows well that the strain is too great to be borne. To outward observers he is the impassible statesman organising defeat over the whole of Europe. Those who, like M. Henrard, lift the veil, find him holding back again and again, as a drowning man clutches at the jutting rocks that rise from the current which is sweeping him away. It has always been supposed that he was at the bottom of the flight of Marie de Medicis, and that he gladly welcomed the opportunity of sowing discord in France. M. Henrard knows better. He shows him refusing to meddle, and checking his subordinates in the Netherlands who are anxious to take up the cause of the Queen-Mother. It is all to no purpose. The fates of the Spanish Monarchy, that incoherent edifice which had every strength but that of nationality, are upon him. The fathers had eaten sour grapes and the children's teeth were set on edge. He has been set to guard, not a self-contained nation, but a multitude of peoples. The work of Ferdinand of Aragon, of Charles V., of Philip II., breaks down in his hands, as it must have broken down sooner or later. He is drawn in at last, and the people pay the penalty, not so much for his sins, as for the sins of an earlier generation.

Our own Charles I., too, owes something to M. Henrard. It has always been suspected that, having made himself master of the secrets of the Belgian revolutionists, he betrayed them to the King of Spain. M. Henrard tells us who the traitor was. Charles's own agent, Gerbier, sold his master's secrets to the Cardinal Infant. Gerbier was, as Mr. Bruce used to call him, "one of Buckingham's bad pennies." Charles had taken him up with the utmost warmth, and corresponded with him, as Louis XV. was wont to do with his ambassadors, over the head of the Secretary of State, who was often left in ignorance of the important fact that his master was secretly commanding conduct

which he was himself visiting with a reprimand. Gerbier was the instrument of Charles's secret negotiations with the malcontent nobility of the States-General. It was his part to assure them how much better it would be to depend upon the King of England than upon anyone else. Much of all this has been published in the *Harleian State Papers*, but much more remains in MS. The intrigue broke off in the end because neither party would trust the other. "The said man" (wrote Gerbier on Aug. 16 [26], 1633) "saith he will repair to me again against such a time as he thinks I can get answer from your Majesty what assurance these States shall have—since your Majesty stands on a place of security for his troops—that your Majesty's troops being in a strong place will not set forwards to make your Majesty Count of Flanders, whereby at last they would become a conquered people by several parties—by English, French, and Hollanders."

All this time, as we now learn from M. Henrard, Gerbier was negotiating with the Government of the Infanta for the sale of these secrets. Twenty thousand crowns was the price which he set upon his knowledge. The Government was short of funds, and had its suspicions of the good faith of the envoy. At last the Infanta took the money from the treasure destined for the payment of the army, judging, as she wrote to her nephew Philip IV. (October 29, November 8), "qu'il y avait moins de dangers de faire attendre le nécessaire à l'armée que d'aventurer par un retard la sécurité des états de sa Majesté." The money was paid. Two Capuchins laboriously carried the coin to the house of the English Agent, who had declared that he would be satisfied with nothing but coined silver. In return he revealed all that he had to tell. The names of the noblemen who had trusted to his honour were given by him without compunction to the Spanish Government.

It has been impossible to do more than notice a few points of this very interesting book. It is one which no one who wishes to understand the period of which it treats can safely neglect.

SAMUEL R. GARDINER.

CURRENT LITERATURE.

Historic Warwickshire: Its Legendary Lore, Traditional Stories, and Romantic Episodes. By J. Tom Burgess. (Simpkin, Marshall and Co.) Mr. Burgess's book has no claim to originality. It is made up almost entirely from printed sources, mostly of the commoner sort, but the tales are well told, and the facts are well arranged. Those who dwell in Warwickshire or travel therein will be amused by many of his stories, and if they do not look upon his book as a serious contribution to local history they will gain some profit by reading it, for the legends, though some of them are certainly not true, and others are only told in part, give a not unfaithful picture of past times. The latter part of the volume is by far the best. It is useful to have in a compact form the history of "The Princess Olive," though a diligent study of *Notes and Queries* would have furnished several facts of importance which the author has omitted. "The Wager of Battle," too, is a correct and useful account of the murder of Mary Ashford by Abraham Thornton, and the grotesque "law plea" which arose thereon. The article headed "Legends and Stories of Plants and Flowers" contains nothing new, and most of the folk-lore mentioned therein has been more picturesquely dealt with

elsewhere. We suppose it is impossible for a Warwickshire man to write a book of any sort without its containing at least one chapter about Shakspeare. This we can pardon here the more readily inasmuch as it contains some pleasing woodcuts: we must, however, protest against Robin Hood being dragged in; he belongs to Nottinghamshire and the West Riding, and all persons using him or those things that are his, elsewhere, ought to be made liable to prosecution for poaching under the Game Preservation Act. The book would have had a higher value had there been more references to the sources from whence information is taken. It would, however, be far better to dispense with them altogether than to give a note like this, "Harl. MSS.," which occurs on page 246. The Harleian collection in the British Museum contains 7,630 MSS., not counting a very large mass of charters, rolls, and such like. Of what possible use can it be to any one to be told that the document Mr. Burgess quotes is to be found in this ocean of written pages? If he has taken it at second hand from a printed book, he should say so; if from the manuscript itself, the number and page should be given. Mr. Burgess tells us that he has visited nearly every parish in Warwickshire, and "consulted all the known available documents relating to the past and present history of the county." Of his industry as a tourist we can have no doubt, but when anyone tells us that he has consulted "all the known available documents" relating to even a single parish or hamlet, the conclusion is forced upon us that he has yet to learn how vast are the stores of record-evidence which the past has spared to us.

Reminiscences of Fen and Mere. By J. M. Heathcote. (Longmans.) The great drainage works which have reclaimed the morasses of our eastern shires have not as yet met with a fitting historian. Dugdale's *History of Embanking and Draining*, it is true, is a great storehouse of information, accurate as far as it goes, but the vast works by means of which our meres and fens have been rendered profitable for industry, and healthy abodes for men, had but just begun when Sir William issued his folio. Wells's *History of the Drainage of the Bedford Level* was published nearly half a century ago. It is full of information as to the subject of which it treats; but the facts it contains are ill-arranged, and mixed with much gossip and speculation quite out of place where it is—for some of it, indeed, it would be hard to find a place anywhere. Now that the State Papers and other national records are open for enquirers, it is not improbable that some one who unites a love for antiquarian research with a competent knowledge of geology, agriculture, and engineering, may be moved to give us a detailed picture of what Englishmen have done towards reclaiming their marshes. Unfavourable as is the contrast between ourselves and Holland, we have still something to be proud of, and if information were circulated on the subject, as it ought to be, among the owners and occupiers of land, it is certain that greater and more important works than any now in existence would soon be undertaken. Mr. Heathcote's book deals but very slightly with the historical part of the subject. It mainly consists of memoranda of facts that have come within the sphere of his own observation. These are so loosely put together that the reader has the feeling that he is turning over the materials for an interesting book rather than that he is reading a volume which has received the last corrections of the author. This is a great drawback, for the reminiscences are not foolish gossip, but really, for the most part, important facts illustrating a state of country and a mode of life which has almost entirely passed away. We gather from Mr. Heathcote's pages that he took an active part in pressing forward the great drainage works which have in quite recent days converted Whittlesea mere from an ague-producing lagoon into valuable corn land. To have had any share in such an

undertaking is a thing to be proud of. We wish the full statistics of the undertaking had been given. No doubt they are to be found by the diligent searcher in some privately-printed report, or in the pages of some newspaper or periodical devoted to agriculture, but the historian or statistician who required them would certainly not know where to look, and in the present state of our books of reference might spend days uselessly in hunting for them. Mr. Heathcote's work is adorned with a profusion of illustrations done by the autotype process. Some few are slight, but most of them are exceedingly truthful and valuable as works of art, and as preserving the memory of objects which have passed away. "The mill used for draining the Fens" is perhaps the best. We speak from experience when we praise the vivid realism of the picture. Mr. Heathcote, is however, probably mistaken when he speaks of "the Fen mill as [having] become a relic of the past." We have frequently seen and heard them on Hatfield Chase, near Doncaster, and if they have been swept away by modern improvements, the change has been very recent. A few mills of this sort may still be seen in the Netherlands, but they have for the most part been replaced by mills built of brick, containing machinery of far more elaborate construction.

CAPTAIN WYATT'S *History of Prussia* (Longmans), of which two volumes have appeared, will be a most voluminous production. The volumes which have already appeared treat of a proportionally small part of the earlier history of those territories which were at a later period incorporated with the Prussian State. They give the history of the Province of Prussia, from which the whole monarchy has derived its name, up to the year 1525—i.e., to the transformation of the ecclesiastical State (which had been founded by the Teutonic Order in the extreme east of the present Empire on a soil gained from the heathen Prussians) into a secular and hereditary duchy, governed by princes from the House of Hohenzollern. We have also the history of the margravate of Brandenburg to the year 1410, when a branch of the same dynasty was transplanted hither from the south of Germany. Then comes a sort of genealogical summary of earlier events in the House of Hohenzollern, and finally the author gives us a history of some of the "imperial cities" of Germany, as he calls them, a history which in this minute form is entirely superfluous in a work devoted to Prussia, and which, moreover, is far from being in all points correct. It is only due to the author to acknowledge that he has endeavoured to tell his story clearly and comprehensibly, and that he has on the whole succeeded in arranging the threads of his narrative in good order. Nor does he deserve reproach for omitting all reference to the proper and primary sources of his history—the documents and chronicles of the Middle Ages, and contenting himself with furnishing a compilation from the works of modern historians. It is, however, to be regretted that he has so insufficient an acquaintance with the modern literature on this subject. In the list of works referred to which precedes the first volume not only are there wanting a great number of smaller monographs, university-dissertations, school-programmes, &c., which have been recently published, but even great fundamental works—indispensable to anyone who proposes to write a History of Prussia—are unknown to Captain Wyatt. We quote only three instances. He knows neither Ewald, *Die Eroberung Preussens durch die Deutschen* (Halle, 1872); nor Droysen, *Geschichte der Preussischen Politik* (Berlin, 1855), one of the most important works in the whole of our modern historical literature; nor Riedel, *Geschichte der Preussischen Königshäuser* (Berlin, 1861). Even Ranke's *Preussische Geschichte* is quoted by him only in the older edition of 1848, and he seems to have no idea that a new edition was published in 1874, in which those very earlier portions with which Captain Wyatt is concerned have been

entirely altered, and in which four new books have been substituted for the one first book of the original edition. It is, therefore, unnecessary to mention that numerous errors and misunderstandings, long removed by modern enquirers, have been reproduced by Captain Wyatt. The first chapter, in which he gives a sketch of the state and form of government of the Old Germans, is especially affected by the defective nature of his studies. There is hardly a period which has been made the subject of more searching investigation in Germany, or which has been written of at greater length during the last ten or twenty years, than the primitive ages of German history, and it sounds almost incredible that Captain Wyatt, instead of quoting such works as Waitz's *Deutsche Verfassungsgeschichte*, refers to a book so utterly obsolete and useless as Cluverius's *Germania Antiqua*, printed at Leyden in 1616. It is earnestly to be hoped that the author will make more use of recent German authors in his forthcoming volumes.

Hadrian VI., ein Lebensbild aus dem Zeitalter der Reformation. Von Dr. Heinrich Bauer. (Heidelberg: Winter.) This is a careful sketch of the life and pontificate of Hadrian of Utrecht. The writer has been really interested in his subject, and has been careful to gather together all that is known about it. What Dr. Bauer has done he has done thoroughly. But we are sorry that his point of view is so narrow, and even polemical. He writes, as he says in his preface, "from the point of view of a Protestant clergyman." Unfortunately this is not the position from which the history of the Popes needs to be treated in the present day. Dr. Bauer regards only the importance of Hadrian VI. in the progress of the Reformation struggle. He argues that as Hadrian was powerless to work reforms within the Church, such an attempt was entirely hopeless. The uprightness of Hadrian's life and the sincerity of his intentions are emphasised to bring out more strongly his failure. His admissions of the need of reforms are quoted as the triumphant justification of Luther's movement. No doubt there is much in this view of the significance of Hadrian's pontificate; but it is only a partial view. Hadrian, in spite of his virtues, was entirely unfit to undertake the task of a reform of the Church. By birth a Netherlander, he had no sympathy with the national feelings of the Italians, and did not know how to maintain the position which a Pope necessarily held in the city of Rome. Moreover, he was an adherent of the old Scholastic modes of thought, which in Italy had entirely passed away. Even Dr. Bauer would not have prescribed, as the means of saving the old Church from dismemberment, a rigid return to obsolete Mediaevalism. Yet this was what Hadrian hoped to do in the generation which read the works of Macchiavelli and Valla. Hadrian VI., also, had none of the impressive decorum and ready tact which the culture of the Italians led them to expect from all in high positions. He seemed to them an ill-bred and pedantic foreigner. If Dr. Bauer had looked a little deeper, and had had the courage to trace Hadrian's failure to the difference between Northern and Southern culture in his time, he would have done an interesting work. As it is, Dr. Bauer shows as profound a misapprehension of Hadrian's position in Italy as Hadrian himself showed. We notice in Dr. Bauer the same absence of humour as in Hadrian. He looks on Hadrian purely from the point of view of Reformation theology, and not of Renaissance culture.

DR. AUGUST POTTHAST has at last finished his *Regesta Pontificum Romanorum* (Berlin: von Decker). He has continued the work begun by Herr Jaffé, and has covered the eventful period of Papal history extending from the Pontificate of Innocent III. to the death of Benedict XI. (1198-1304). Of the value of such books to historical students it is needless to speak. A catalogue of the Papal letters, bulls, and other documents is

necessary to any one who would understand the history of the Middle Ages. Dr. Potthast's work has been done with all the care and industry which is the mark of a German historian. He is a worthy follower of Pertz, Böhmer, and Jaffé. It deserves notice that the funds necessary for the publication of this work have been supplied almost entirely by the Literary Academy of Berlin.

Facsimile of the Original Domesday Book, or the Great Survey of England, A.D. 1080. With Translation by General Plantagenet-Harrison. (Head and Meek.) If the first part of this publication, containing the Survey of Middlesex, is a fair sample of the whole, its success is neither probable nor desirable. For the classes with whom illustrated Bibles, Gazetteers, and English Histories at half-a-crown a part find their readiest sale it is by its nature not sufficiently attractive, and for the purposes of the historical student and the antiquarian it is almost worthless. Facsimile and translation are, in fact, equally unsatisfactory. The former is plainly produced, not from plates taken from the original manuscript, but from the well-known and valued photozincographed copy published, under the direction of Sir H. James, by the Ordnance Office; and it is badly marred in the process. From whatever cause, the letters are blurred in outline and spongy, some of them being run together, and others so faintly reproduced as to be almost illegible. This anyone may see for himself, if he will compare the fourth and last columns with those corresponding in the Ordnance facsimile. As for the translation, no very close examination is needed to show how far it falls short of the requisite standard of precision and correctness. In translating a formal document like *Domesday*, in which the same terms constantly recur, strict uniformity of rendering should, of course, be observed. Mr. Harrison however, thinks otherwise. Thus, among other examples, "Terra i carucata" is rendered, for no apparent reason except a love of variety, sometimes "The land is one carucate," sometimes "Land for one plough;" while "In totis valentiis valet" is translated in three different ways in the same column. Worse than this laxity, however, are positive errors in translation, of which there is no lack. Opening the book at random we have:—Section 7, "Vendere potuerunt" = "he could sell;" Section 8, "Comes de Moritonia tenet in leleham ii hidas et abbas de fiseanno de eo. Terra i carucata et dimidia" = "The Earl of Moretaine holds in Laleham two hides, and the Abbot of Fescampe of him land for one plough and a half;" when, of course, the meaning is "and the abbot holds them [i.e., the two hides] of him;" Section 9, "Osulestane" = "Ossulton" instead of "Ossulston," and "post mortem regine eodem modo tenuit de rege" = "after the death of the Queen he now holds it of the King in the same manner," where "modo" does duty twice over, first as an adverb and then as a substantive; Section 10, "Parcus est ibi ferarum siluaticarum. Silua mille et quingentis porcis" = "There is a park of wild beasts there, a beech grove. Wood for five hundred pigs." There is no need to go further. The appendix, which professes to give "full historical notes and explanations of obsolete terms, &c., &c.," is miserably inadequate; the editor's dozen lines of preface contain paradoxical statements without a word to support them; and the title-page gives a date to the Survey which no one who has studied it can fail to see must be wrong.

NOTES AND NEWS.

MR. JAMES ROUTLEDGE has in the press a work entitled *Chapters in the History of Popular Progress, and of Struggles for the Free Expression of Opinion, chiefly in Relation to the Freedom of the Press, from 1680 to 1820, with a Brief Application to Later Times*. The main events of the volume are grouped around the American War, the French Revolution, and the Peace of 1815, a

period which includes the State Trials, the Letters of Junius, the *North Briton* of John Wilkes, the writings, speeches, and trials of Horne Tooke, the action and prosecution of Cobbett, and the significant trials of William Hone, which virtually ended the long history of *ex-officio* information and Ministerial interference with the Courts of Law. This volume will be published shortly by Messrs. Macmillan and Co.

MESSRS. RIVINGTON will shortly issue, among other works, a *Life of Fénelon*, by the author of *Bossuet and his Contemporaries*, *A Dominican Artist*, &c.; *The Orthodox Doctrine of the Church of England*, based on the Thirty-Nine Articles, by the Rev. Thos. J. Ball, with an introduction by the Rev. W. J. E. Bennett, of Frome Selwood; and a volume of *Songs and Hymns of the Greek Christian Poets*, translated into English verse, by the Rev. A. W. Chatfield.

COMMANDER CAMERON has nearly completed his forthcoming book, *Across Africa*. It will be profusely illustrated, and embellished with a map taken from Commander Cameron's own notes; and will be published by Messrs. Daldy, Isbister, and Co., early in November.

MR. INGRAM BYWATER's long-expected work on the Fragments of the Philosopher Heraclitus is in the printer's hands, and will appear in a few weeks at the Clarendon Press.

MESSRS. CASSELL, PETTER AND GALPIN have in preparation and will shortly publish an edition of the complete works of Shakspeare, under the title of *The Leopold Shakspeare*, dedicated by special permission to H.R.H. Prince Leopold. The text used is that of Prof. Delius, of Bonn, who has arranged the several works in chronological order, while a general introduction to the edition will be written by Mr. F. J. Furnivall. The edition will include the "Two Noble Kinsmen" and "Edward III.," the text of the former play revised by Mr. Harold Littledale, the latter being from the text of Prof. Delius.

MESSRS. HODDER AND STOUGHTON's list of announcements of forthcoming works includes the following:—*The Life and Writings of St. John*, by the Rev. Dr. J. M. Macdonald, edited, with an Introduction, by Dean Howson; *The Englishman's Critical and Expository Bible Cyclopaedia*, edited by the Rev. A. R. Fausset, M.A.; *The Catacombs of Rome and their Testimony relative to Primitive Christianity*, by the Rev. W. H. Withron, M.A.; *The Creeds of Christendom*, by the Rev. Dr. Philip Schaff, in three volumes, octavo; *Godet's Biblical Studies on the New Testament*, edited and translated by the Hon. and Rev. W. H. Lyttelton, M.A.; *The Witness of Art; or, the Legend of Beauty*, by Wyke Baylis, F.S.A.; *Rowland Hill: his Life, Anecdotes, and Pulpit Sayings*, by Vernon J. Charlesworth, with Introduction by C. H. Spurgeon; *The Prophets of Christendom*, Sketches of Eminent Preachers, by the Rev. W. Boyd Carpenter, M.A.; *Saint Christopher with Psalm and Song*, a new volume of poetry; *Duff Davie, and other Sketches: being Sketches of Scottish Life and Character*, by the Author of *Rose Douglas*; *The Inductive Method of Christian Enquiry: an Essay*, by Percy Strutt; *The Inner Life of the Religious Societies of the Commonwealth*, by Robert Burclay; the concluding volume of Dr. Pressensé's *Early Years of Christianity*, translated by Annie Harwood Holmden; *Glimpses of the Inner Life of our Lord*, by the Rev. W. G. Blaikie, D.D.; *The Fulness of Christ: or, the Typical Teachings of the first Nine Chapters of Joshua*, by Sarah Smiley; *Sermons*, by the late Rev. D. Loxton, of Sheffield; and the fourth volume of the *Expositor*, edited by the Rev. Samuel Cox.

A NEW and revised edition of Mr. H. G. Keene's *Fall of the Moghul Empire* is in the press, and will be ready for publication in a week or two by Messrs. W. H. Allen and Co.

THE concluding volume of Lord Edmond Fitzmaurice's life of his grandfather, the Earl of

Shelburne, will be published during the autumn by Messrs. Macmillan and Co. It will be illustrated by maps throwing new light on the vexed question of the American frontier.

DR. MOZLEY has now in the press a volume of lectures delivered to Graduates of the University of Oxford on *Old Testament Difficulties*, which will be issued by Messrs. Rivington during the coming season.

AMONG Messrs. George Bell and Sons' forthcoming works are: *The Poems of John Keats*, Aldine Edition, with a Memoir by Lord Houghton; and a *Handbook to the Department of Prints and Drawings in the British Museum*, with Introduction and Notices of the various Schools, by Louis Fagan, of the Department of Prints and Drawings in the British Museum.

MESSRS. MACMILLAN AND Co. promise among their Christmas books an edition of Washington Irving's *Bracebridge Hall*, illustrated by Mr. Randolph Caldecott, whose humorous and fanciful drawings for the same author's *Old Christmas* attracted so much attention last year.

THE two-volume edition of Shelley, edited by Mr. W. M. Rossetti, with Memoir and Notes, and published by Messrs. Moxon and Co. in 1870, has been out of print for some while now; and the curious fate of being unprocurable even in the British Museum has befallen this book, as the Reading-room copy was stolen. It is now proposed to reissue the work at an early date: Mr. Rossetti going carefully and *de novo* through the task of editorship, and introducing numerous modifications, additions, &c., into the Memoir and Notes, and indeed into the text itself, dependent sometimes upon more recent information (brought forward by himself among others), sometimes upon change of views, or the strictures of other critics. On the whole, the text will be somewhat more strictly conservative than in the previous instance. Most probably the book will appear in two forms—a three-volume edition, with leaded type; and a two-volume edition, the same type, but with the leads removed. Moreover, the type itself will be larger than in the edition of 1870.

THE second volume of the *Catalogue of Oriental Coins in the British Museum*, by Mr. Stanley Lane Poole, has just issued from the press. It comprises the Mohammedan Dynasties numbered Classes III. to X. in Fraehn's classification; thus describing the coins of the Khalifs of Spain and the smaller dynasties that sprang up as these approached their fall; the early African dynasties—the Idrisids, Benû-l-Aghlab, Benû-Tûlûn, Ikshîdîs; the early Persian rulers—the Tâhirîs, Simânîs, Sâlfârîs, Ghaznavîs; the Shihs of Khuwârezm (or Khiva), Buweyhis, Abû-Dawûdis, Khâns of Bulgaria, and Khâns of Turkistân. The volume ends with some sixty pages of indexes, by which the minute details of the contents are rendered easily accessible. It is just a year since the first volume appeared; and it is expected that the third volume will be published in another year's time, or less.

HEBREW scholars will be glad to hear of the publication of *Elucidations of a Part of the Prophecies and Hagiographa* (Lemberg: Menkes), by the late Samuel David Luzzatto, of Padua, whose merits have been so cordially recognised by Dr. Franz Delitzsch in his commentary on Isaiah.

THE Working Men's College, 45 Great Ormond Street, has been selected by the Society for the Extension of University Teaching as a common centre for that College and its neighbour, the College for Men and Women, 29 Queen Square. At the general meeting on Thursday, October 5, Mr. J. E. H. Gordon, B.A., of Gonville and Caius College, Cambridge, will deliver an address on the "Characteristics of Modern Physical Research," introductory to a course of lectures to be delivered at the College on Electricity and Magnetism. This meeting is open to the public.

WE understand that Sir Thomas F. Wade, K.C.B., Her Majesty's Minister in China, is now busily engaged at Shanghai in getting out a second edition of the *Tzu-Erh Chi*, a work which is of very great value to students of the Chinese language. This book, which deals with both colloquial and documentary Chinese, originally appeared in 1867, and, owing to unavoidable difficulties in passing a publication of such magnitude through the press, the first edition was necessarily somewhat imperfect. The title *Tzu-Erh Chi*, it may not be out of place to mention, is the Chinese equivalent of "Progressive Course." The two great divisions of the work are distinguished by the prefixes *Yü-yen* (i.e., words and phrases) and *Wên-chien* (i.e., written papers).

DURING the year ended June last no less than seventy-six fresh newspapers and magazines appeared in Japan, of which fifty-five were started at Yedo.

THE forthcoming number of the *Revue Historique* will contain the following articles:—F. T. Perrens, "Pierre Martyr et l'Hérésie des Patarins à Florence;" R. Darest, "F. Hotman;" P. Gaffarel, "La Fronde en Provence;" Fustel de Coulanges, "De l'Inégalité du Wergeld dans les lois franques;" C. Paillard, "Détournement au profit des Huguenots d'un Subside envoyé par Philippe II. à Catherine de Médicis;" H. Regnald, "Gisbert Cuyper, Journal inédit d'un savant hollandais pendant la Campagne de 1706;" &c.

In addition to the list of Science Lectures delivered at South Kensington, which Messrs. Macmillan and Co. announced some weeks ago for publication in sixpenny volumes, will be published two lectures on the steam-engine, by Mr. F. J. Bramwell, F.R.S.

MR. J. B. SHEPPARD, of Canterbury, whose Report on the *Chartae Antiquae* of Canterbury forms the leading feature of the Fifth Report of the Historical Manuscripts Commission, 1876, has since made a thorough examination of the *Libri Registrales* in the Cathedral Library, and drawn up a report on them. We trust that this will find a place in the next Report of the Commission, among the rest of Sir T. Duffus Hardy's tempting lists. The *Libri* are twenty-eight in number, the last Report says; that marked D contains copies of wills from 1500; G holds copies of bulls from 1060, and of charters, of which the earliest is granted by Canute; O, copies of charters from A.D. 615, regulations for the cellarer, &c. II, we are informed, contains a Treatise on Morality and Policy by Walter de Henlee, in French, with English Proverbs, and a French treatise on the Profit of Farming and the Supervision of Servants. One would like to know more about all these documents.

WE are glad to hear that an offer has been made to Mr. Rawdon Brown, by one of our publishing societies, to print his valuable book, and we heartily hope that he will let it see the light. One does not like to think that such interesting material as it contains for illustrating the social life of England at Shakspeare's death has been allowed to lie hidden (almost) for above twenty years for want of a publisher to put it in type. May volunteers atone for the regulars' shortcomings!

MR. FURNIVALL's third book for the New Shakspeare Society's Sixth Series, that of Shakspeare's England, is the largest and most important of his four, but the cost of it proves too much for the balance of the Society's funds this year, and it will therefore be thrown over to 1877, though it can be had next week by all members who pay their subscription in advance. It is the second of Canon Harrison's three books of the *Description of Britaine*, but the first of his *Briefve rehearsal of the nature and qualities of the people of England, and such commodities as are to be found in the same*, and is edited from the second edition of 1557, with marks and extracts showing

all its variations from the first, 1577. The rare merit and interest of Harrison's work, which is a description of the Elizabethan England under his eyes as he wrote, have been obscured by its long historical and topographical description of the country in the first book, and by the whole work being accessible only in the big folios of Holinshed's Chronicle. Otherwise, the amusing and informing chapters of the second book on "The Food and Diet of the English," with the musical-headed Frenchmen as cooks, the new use of Venice glass, the jellies, tarts, wines—the best, *Theologicum*, sent to the monks by the merchant who feared the devil—the working men who "haue dined so well as my lord maior;" on "their Apparell and Attire," the Englishman looking like a dog in a doublet, and his hairy cheeks "big like a bowdled hen, and so grim as a goose;" the women with their new colour, "the diuell in the head, I should say hedge;" on "the maner of building and furniture of our Houses," with its note of the changes in Harrison's day, from reredosses to chimneys, from hopharlot coverlets and a good round log under one's head, to counterpanes, bolster, and pillow, &c., &c., must alone have secured the frequent reprinting and wide circulation of the book. As it is, the present is the first reprint; and Book III. has yet to come. To his "Forewords," giving new details as to Harrison's life, Mr. Furnivall has added three appendices:—1. Contemporary extracts from the lately-unearthed MS. of the author's *Chronologie*; 2. Selections from Mr. Brenchley Rye's interesting *England as seen by Foreigners in the Days of Queen Elizabeth*—whether, like Lemnius, they thought us charming (and the women as pretty as angels), or like Perlin, *ces vilains là*—3. Mr. H. B. Wheatley's *Notes on Norden*, and his Map of London, 1593 (which accompanies the volume), giving some pleasant chat and sound information on the chief buildings and places that Shakspeare saw in the City of "lovely," of "noble London."

THE following table shows the number of students in the principal Universities of Germany during the summers of 1857 and 1875:—

	Summer, 1857.	Summer, 1875.	Increase	Decrease
1. Leipzig . . .	828	2775	1947	—
2. Berlin . . .	1409	1724	315	—
3. Breslau . . .	784	1068	284	—
4. Göttingen . . .	656	1062	406	—
5. München . . .	1358	1012	—	346
6. Würzburg . . .	653	961	308	—
7. Halle . . .	705	882	177	—
8. Tübingen . . .	706	878	172	—
9. Bonn . . .	873	776	—	97
10. Heidelberg . . .	606	725	119	—
11. Strassburg . . .	808	640	—	150
12. Königsberg . . .	355	611	256	—
13. Jena . . .	282	537	255	—
14. Greifswald . . .	244	496	251	—
15. Marburg . . .	240	421	181	—
16. Münster . . .	402	412	10	—
17. Erlangen . . .	549	401	—	148
18. Giessen . . .	343	326	—	17
19. Freiburg . . .	304	294	—	10
20. Kiel . . .	142	190	48	—
21. Rostock . . .	109	161	52	—

The sum total of students in the German Universities in 1857 was 12,356; in 1875, 16,360. Taking the population of Germany in 1875 as 42,757,812, we find one student for every 2,613 inhabitants. What are the corresponding figures in England?

OBITUARY.

DESPOIS, Eugène, at Paris, Sept. 23, aged 58.
 HENNERHEIM, Rudolf, at Brunswick, aged 50. [Historical painter; pupil of Couture.]
 LAYCOCK, Prof. Thomas, at Edinburgh, Sept. 21, aged 61. [Author of *The Reflex Functions of the Brain, The Mind and Brain*, &c.]
 SHILLETO, Richard, at Cambridge, Sept. 24, aged 66.

EUGÈNE DESPOIS.

M. EUGÈNE DESPOIS died on Saturday the 23rd inst., aged fifty-eight, of an affection of the lungs. After having been one of the most brilliant pupils of the Normal School, he became while still young Professor of Rhetoric at the Lycée Louis-le-Grand. At the presidential election of December 10, 1848, more far-seeing than the majority of his political co-religionists (he was an advanced republican), he published a pamphlet against the candidature of Prince Louis Napoleon, of which 50,000 copies were struck off. After December 2, 1851, faithful to his convictions, he gave in his resignation to avoid taking the oath of allegiance to the new régime. Since then he lived a laborious life, giving lessons as private tutor. It was only after the revolution of September 4 that he accepted a Government post; he was nominated librarian at the Sorbonne. In spite of the daily labours to which he was condemned, and which furnished him with the bare means of subsistence, Despois remained passionately attached to literature. He contributed to the *Revue des Deux Mondes*, to the *Revue de Paris*, of which he was one of the founders, to the *Réforme littéraire*, and finally to the *Revue politique et littéraire*. The volumes which he has published are chiefly collections of articles—*Les Lettres et la Liberté*, *Le Théâtre sous Louis XIV.*, *Le Vandalisme révolutionnaire*. In the last-named work he has reduced to their real value the attacks directed against the Revolution, and shown what it has done for literature, the arts and public instruction. The French Revolution and the age of Louis XIV. were the two principal subjects of Despois' studies. He knew them as a man of learning; he spoke of them as a man of letters and an elegant, witty and sometimes eloquent writer. He was commissioned by M. Ad. Regnier to edit Molière in Messrs. Hachette's "Collection of French Classics." The three volumes which have appeared are models of scholarly editing. He has unhappily not been able to complete his work. The death of a wife whom he tenderly loved struck a mortal blow at his health, and he followed her to the grave after a few months' interval. Despois' was a man of Stoical character, and his virtues had a tinge of defiance; but he was a subtle yet severe writer, who will leave to all who knew him a profound and tender memory as well as an example to admire and to follow. G. MONOD.

NOTES OF TRAVEL.

ELEVEN years ago, before the outbreak of the war between Brazil and Paraguay, plans were under discussion for uniting the Brazilian interior province of Matto Grosso by railway with the Atlantic coast, thereby to shorten the great round of water-communication by the Paraná and Paraguay rivers, and to become independent of this route in case of war. Since that time the North American Pacific Railroad has been completed, and the idea of a similar great South American line, to cross from the Atlantic coast of Southern Brazil to the Pacific in Bolivia, is now occupying the attention of South American engineers. In the September number of *Petermann's Mittheilungen*, Major Emerich, writing from Rio, gives a sketch of the chief of these projects, and invites the criticism of European authorities upon them. Most of the plans make use of the line which was actually surveyed some years ago by English engineers, from Curitiba to Miranda in Matto Grosso; from that central point there are various schemes for taking a railway through the richest parts of Bolivia and thence down to the Pacific through one or other of the great Andean lines which are in construction by the Peruvian Government. Dr. Wagner also gives a useful sketch of the present condition of the Bolivian coastland, best known as the desert of Atacama, but now dotted over with increasingly busy mining villages and seaports which have risen into existence since the discovery of its wealth in silver and nitrates.

FROM Paraguay we learn that the Government has engaged a steamer to make fortnightly trips to Corrientes, with the object of bringing back from that province the numerous Paraguayans who were expatriated during the war, and who have now no means of returning to their country. Some time ago a concession was obtained for the introduction of coffee-growing on a large scale in northern Paraguay, and the experiment is now being practically tested, ten thousand young plants having newly been imported. The export of oranges is also increasing; not less than 830,000 were sent down from Asuncion in the first fortnight of July.

THE last number of the *Cosmos* contains several letters from M. Largeau, describing his late journey across the southern part of the Algerian Sahara, from El Wad towards Ghadames, in which he gives special attention to the interesting subject of the formation of the drifting sand-dunes in the desert belt of El Erg.

M. BORDE's *Histoire de la Trinidad sous le Gouvernement Espagnol* (Paris: Maisonneuve et Cie.), the first part of which, treating of the discovery by Columbus, the conquest and colonisation of the island (1498 to 1797), has now been published, gives evidence of the greatest care and research. The history is original, and as far as this first volume extends there is no work with which to compare it, since the only previously existing *History of Trinidad*, by E. L. Joseph (1840), gives but a few pages to this epoch. The motives which, M. Borde tells us, led him to undertake the work were the importance of collecting and arranging the materials for a history before time and accident had destroyed them for ever; the necessity of rectifying many oft-repeated historical and geographical blunders; to bring to light the unique fact of the colonisation of a Spanish island by a French population, a circumstance which explains why the manners and customs of Trinidad are French and not Spanish at the present day; and to teach patriotism to the youth of the island by showing them who and whence they are, not English, or French, or Spanish, but *bon gré mal gré* Trinidadians, although subjects of England. In gathering materials locally and in foreign countries, M. Borde has spared neither time nor cost. Two works of great importance to his task, the only ones written by Spaniards on the events of the island, he has not yet been able to find in America or Europe: these are *De Missionibus Insulae Trinitatis, simul cum gestis et agonibus servorum Dei, Stephani a S. Felice, Raymundi de Figuerola ac Marci de Vigue, Capuccinorum*, by Fr. Matheo de Anguiano, published at Madrid in 1702; and the *Relacion de lo Sucedido en la Isla de la Trinidad, siendo Gobernador de estas provincias, y del Dorado, Don Diego Lopez De Escobar*, 1637, without name of author or of place of publication.

THE GEOGRAPHICAL CONFERENCE AT BRUSSELS.

THE following is the text of the "Déclaration" of the Geographical Conference which has just been held at Brussels, under the presidency of H.M. the King of the Belgians:—

DÉCLARATION DE LA CONFÉRENCE.

"Pour atteindre le but de la Conférence internationale de Bruxelles, c'est-à-dire: explorer scientifiquement les parties inconnues de l'Afrique, faciliter l'ouverture de voies qui fassent pénétrer la civilisation dans l'intérieur du continent africain, rechercher des moyens pour la suppression de la traite des nègres en Afrique, il faut:—

"1° Organiser, sur un plan international commun, l'exploration des parties inconnues de l'Afrique, en limitant la région à explorer, à l'Orient et à l'Occident, par les deux mers, au Midi par le bassin du Zambéze, au Nord par les frontières du nouveau territoire Egyptien et le Soudan indépendant. Le moyen le mieux approprié à cette exploration sera l'emploi d'un nombre suffisant de voyageurs isolés, partant de diverses bases d'opérations;

"2° Établir comme bases de ces explorations un certain nombre de stations 'scientifiques et hospitalières' tant sur les côtes de l'Afrique que dans l'intérieur du Continent.

"De ces stations, les unes devront être établies, en nombre très-restrict, sur les côtes Orientale et Occidentale d'Afrique aux points où la civilisation Européenne est déjà représentée, à Bagamoys et à Loanda, par exemple. Les stations auront le caractère d'entrepôts destinés à fournir aux voyageurs des moyens d'existence et d'exploration. Elles pourraient être fondées à peu de frais, car elles seraient confiées à la charge des Européens résidant sur ces points.

"Les autres stations seraient établies sur les points de l'intérieur les mieux appropriés pour servir de base immédiate aux explorations. On commencerait l'établissement de ces dernières stations par les points qui se recommandent, dès aujourd'hui, comme les plus favorables au but proposé. On pourrait signaler, par exemple, Udjiji, Nyangwe, la résidence du Roi, ou un point quelconque situé dans les domaines de Muata-Yanvo. Les explorateurs pourraient indiquer, plus tard, d'autres points où il conviendrait de constituer des stations du même genre.

"Laisant à l'avenir le soin d'établir des communications sûres entre les stations, la Conférence exprime surtout le vœu qu'une ligne autant que possible continue de communications s'établisse de l'un à l'autre océan, en suivant approximativement l'itinéraire du Commander Cameron. La Conférence exprime également le vœu que, dans la suite, s'établissent des lignes d'opération dans la direction Nord—Sud.

"La Conférence fait appel dès aujourd'hui au bon vouloir et à la coopération de tous les voyageurs qui entreprendront des explorations scientifiques en Afrique, qu'ils voyagent ou non sous les auspices de la Commission internationale, instituée par ses soins."

GERMAN LETTER.

Gotha: Sept. 15, 1876.

There is no longer any just ground for the complaint that our scholars do not know how to express their thoughts in plain German. Not only do our historians and scientific men nowadays write a clear and simple, some even an elegant, style, but even our philosophers and theologians are by degrees giving up the mysterious jargon with which they used to frighten away the uninitiated, and endeavour to speak of the hidden things of the soul and spirit in such a way as to be generally understood. Lange's *History of Materialism* is, perhaps, the most remarkable example of the change in the philosophical domain; Aug. Hausrath's latest work, *David Friedrich Strauss und die Theologie seiner Zeit*, Erster Theil (Heidelberg: Bassermann), in the theological. The latter is not so much a biography as a clear and readable history of modern German theology. The author himself tells us in the preface that his object was less to write a life of the great theologian than to trace his mental development, and describe his position with regard to theology: an object he has hardly attained, however, for we get no very clear idea either of Strauss's peculiar mind or the strange mixture he presented of Swabian mysticism and scientific criticism; but the literary side of the man is well drawn, the parties that held the religious field, and their various movements in so far as they bore on the great critical work, the *Life of Jesus*, are very happily characterised, and a few portraits here and there—those of the Berlin Court-theologians, Hoffmann and Hengstenberg, for instance—admirably sketched. The wonderful conflict provoked by Strauss' summons to Zürich, with which the first volume concludes, is likewise clearly and minutely described.

Erwin Rohde's work, *Der Griechische Roman u. seine Vorläufer* (Leipzig: Breitkopf und Hartel), is a valuable contribution to the history of the development of the antique spirit. Though the author had to deal with material in some sense ungrateful, and extremely scanty as well, and treads on ground hitherto little known, the result gives proof no less of his learning than of his cleverness and penetration. He

explains how the rhetoric produced by the Hellenic taste and craving for the artistic became in the time of the Roman Empire the basis of general culture; how these prose artists went on to turn their talents to poetry, and finally created the fantastic and rhetorical love-tale; above all he tries to trace the origin of this strange plant to the classical literature of the Greeks, more particularly to the erotic elegy of the Alexandrians. The poets of the Hellenic age could do nothing more with the religious fable, and preferred the little love-stories, legends, and local traditions, which Stesichorus was the first to clothe in poetical form, and which were afterwards collected in such numbers by historians and antiquarians. They introduced the gallantry and sentimentality of their day, which had so strangely altered the aspect even of the myths of the gods and heroes, into these simple stories, and thence sprang a species of ballad-poetry which, with the help of Roman imitations, Rohde now tries to reconstruct from scanty fragments, and which, at any rate in the form and construction of the stories, corresponds to the prose novel. But the latter adds a new element to the love-story — namely, the accounts of strange lands and peoples which, from the time of the *Odyssey* and more especially after the expeditions of Alexander the Great, played such an important part in Greek literature and were made use of by philosophers and politicians to embellish the creations of their fancy. While an unfortunate pair of lovers were being forcibly separated and subjected to all kinds of perils by sea and by land, the two elements could be united in a fitting manner, and the author discovers the first attempt of this kind in the novel of Antonius Diogenes, *The Wonders Beyond Thule*, which he supposes to have been written in the first century after Christ, and to have been the model of the subsequent love-stories.

The new edition of K. Lehrs' *Populäre Aufsätze aus dem Alterthum* (Leipzig: Teubner) takes us further back into the classical ages of Greek antiquity. Of the new articles the most remarkable are, the long one entitled "Zeus und die Moira," and those on the natural religion of the Greeks and their views with respect to a life after death. The book concludes with papers by George Grote and Chr. A. Lobeck, two leading authorities on all questions connected with Greece and the Greek religion. To attempt to form any idea as to what the religious and moral views of a people may have been from the many-sided utterances of philosophers and poets, from inscriptions, terms of speech and statements which chance has handed down to us, cannot but be always a hazardous experiment; it is often impossible to reconcile contradictory statements without arbitrary modification of the one or the other, and Lehrs does not appear to have always paid sufficient regard to the great necessity of a more rigid division of the different epochs. But a knowledge of the literature of Greece rarely to be met with, and the experience of a long life devoted to the study of antiquity, enable the eminent scholar to give us ideas which, little as they often agree with what our Christian divines tell us of the benighted heathen, are genuinely Hellenic. Do we not hear even cultivated and liberal clergymen say that it was the Christian religion which first taught men to regard God as their father? Yet the Greeks never addressed Zeus otherwise than as Father Zeus. With all the vigour of youth the aged master carries on his controversy against the explanation of the Hellenic fables from the phenomena of outward nature. And yet we fail to ascertain Lehrs' own opinion with regard to the origin of the Greek mythology as a whole, or his ideas with respect to the religious views of the period when men's imagination and feelings were essentially in bondage to nature; but we can well understand the disgust a man so deeply imbued with the views of a classical age must feel for the way in which the brilliant images of Greek poetry are nowadays

invariably made to embody always the same trivial ideas.

R. Hamerling's *Aspasia* (Hamburg: Richter) is a curious attempt at a poetical treatment of antiquity. By calling the book a *Künstler- und Liebesroman*, the poet shows at the outset in what light his work is to be judged. The brilliant figures of a Pericles, a Pheidias, and a Sophocles, set in the gorgeous background of that wondrous age, are used to represent the nature of love and art in dialogues and scenes which are carefully thought out and delicately executed. It is, of course, always rather a doubtful experiment to introduce well-known scenes and figures like these into a work of fiction and so dress them up in fancy colours as totally to mask their real character; but, nevertheless, it is impossible not to admire the author's artistic handling of the subject and the cleverness with which the ideas are worked out.

Felix Dahn's *Kampf um Rom* (Leipzig: Breitkopf und Härtel) is another attempt of a similar kind, though less successful, to clothe history in an artistic form. It represents the fall of the Goths in Italy, invests the Germanic heroes with an ideal glory, and, as a contrast to them, depicts the depraved corruption of the Byzantine court, Justinian, Theodora, Belisarius, Narses, and, lastly, the degenerate descendants of the ancient Romans. It is overlaid with startling effects, and though the noble Goths are made to philosophise in the most modern phrases, and a Roman whose Caesarian character we should find it hard to reconcile with the then-existing state of things in Rome plays the chief part in the story, it yet lays claim to historical truth. What appears to be considerable historical knowledge as well as poetical talent of no mean order has been in this case turned to very poor account.

Goethe's *Briefwechsel mit den Gebrüdern von Humboldt* (Leipzig: Brockhaus), on the other hand, shows us acceptably how strong the tie was which bound our great men at the close of the last century to antiquity. Many things contained in these letters have been published before, some by Goethe himself in the *Propylæa*. In a letter of Wilhelm von Humboldt's, for instance, we come upon that delightful passage from Goethe's *Winkelmann* :—

"Ich kenne für mich nur noch zwei gleich schreckliche Dinge, wenn man die Campagna di Roma anbauen und Rom zu einer policirten Stadt machen wollte in der kein Mensch mehr Messer trüge. Kommt je ein so ordentlicher Papst, was aber die 72 Cardinale verhüten mögen, so ziehe ich aus. Nur wenn in Rom eine so göttliche Anarchie und um Rom eine so himmlische Wüstenei ist, bleibt für die Schatten Platz, deren einer mehr werth ist, als dies ganze Geschlecht."

When we call to mind that this was written by a statesman in office, we must own that it produces rather a strange impression, but who could fail to understand him? Wilhelm von Humboldt is a worthy representative of the age to which we owe our modern German civilisation, when men really lived for self-culture and with a view to becoming perfect men. And we are not surprised to find that his letters can be printed as they stood, for what he wrote was the expression of feelings which had undergone a purifying and refining process, thoughts which had ripened slowly, and loosened themselves like ripe fruits at the right moment from the tree.

We see how these men were always working at their own improvement, not only in one single direction; the latest results are but the necessary fruit of the inward development, and, therefore, such as for beauty and perfection we in these days of one-sided work shall never see equalled.

C. ALDENHOVEN.

The second volume of the Bishop of Ossory's edition of Archdall's *Monasticon Hibernicum* will be published on October 5, by Mr. W. B. Kelly, of Dublin, and the third volume, completing the work, may be expected to appear in January, 1877.

CORRESPONDENCE.

NEW GUINEA.

Oxford: September 25, 1876.

I have received the accompanying letter from the Rev. W. G. Lawes, one of the London Missionary Society's clergymen stationed at Port Moresby, New Guinea. As you have upon several previous occasions published letters written to me by Mr. Lawes, I trust you will be able to find space for the one now sent to you.

In another letter received by me from him by the same mail, but not intended for publication, though very abundantly confirming the general drift of the one herewith enclosed, I am sorry to find the unhealthiness of the Port Moresby district put beyond question by the following statement:—"We are suffering a great deal again this year from fever and ague, and I am afraid we shall not be able to remain here another year."

GEORGE ROLLESTON.

"Port Moresby, New Guinea: June 22, 1876.

"You will probably have seen a letter to the Royal Geographical Society written by Mr. O. Stone from this place. There are several inaccuracies in it which I should like to correct. Mr. Stone was only here three months, and visited no other coast village (save one a few miles from here); he knew nothing of the native language when he came, and but little when he left, so that it is no matter for surprise that there should be mistakes, although I gave him much of the information he has published.

"Mr. Stone's orthography in native words is very faulty.

"As the task of reducing the language to a written form has devolved on me, I might as well state the rules which I have followed. The language belongs undoubtedly to the Malayo Polynesian. Every syllable ends in a vowel. To this there is no exception. The vowels have the Continental sounds: 'a' as 'a' in arch, 'e' as 'a' in hate, 'i' as 'i' in pique, 'o' long as in note, 'u' as 'oo' in coo. The consonants have the English sounds; there is only one double consonant, and that is *ts*, but for the natives *t* only need be used, for it is only when followed by certain vowels that it takes the *ts* sound.

"In Mr. Stone's letter *Ilema* should be *Elema*; *Kirapuno*, *Kerepunu*; *Hordu*, a water chatty, should

be Hotu; Taurau, the native Hades, should be Taulu; Okor, plumbago, should be Okò; Ura, cooking-pot, should be Uro, as in many Polynesian dialects: Dimun, for a fathom measure, is altogether wrong—it should be 'loha.'

"The name of the boat-keel shaped mountain at the back of Port Moresby is in the Motu language *Manukau*, and not *Tapoharti*.

"2. Taro does not grow at Port Moresby.

"3. Mr. Stone's estimate of population is much too high. I have been all along the coast, from Redscar Head to China Straits, and am quite certain that the average distance between the villages is more like fourteen miles than four; I think fourteen is too low. The villages will not average sixty houses. The estimate of the inland population is very much too high.

"4. Mr. Stone is quite wrong in saying that in the burial customs of the Motu the corpse is laid in the grave and then covered in. This is only done in few cases, and where the person buried is of no importance. The custom is to lay the body in the grave and only cover it lightly with a board, &c. The relatives sleep round it, and when the flesh has decayed it is taken up, the skull, knees, and one or two other parts rubbed with a pink clay, and it is then covered in with shingle.

"In Koiali, too, the body is not cut up when recently dead. It is allowed to remain until it falls to pieces, and it is only when the bones are dry that they are wrapped up in a bundle and suspended in the house.

"5. The pink clay is an edible earth, but is not 'rose coloured lime,' and is never chewed with the betel nut.

"6. When I gave Mr. Stone the thermometer-readings for the year it was not the temperature at nine o'clock, but the thermometer-readings for the previous twenty-four hours recorded at nine o'clock.

"7. The natives cannot count a million. Kerebu is 10,000.

"8. The bow and arrow are used by the Motu in war almost as much as the spear.

"9. Mr. Stone requires a much more extensive knowledge of New Guinea than he has to be able to make an assertion as to which is 'the most handsome tribe in the whole of New Guinea;' to say that the natives of Kerepunu are 'without doubt the most handsome' is a very rash statement, seeing that the tribes of which Mr. Stone has any personal knowledge may be counted on his fingers, and his only acquaintance with Kerepunu was made in three or four hours from five canoes that came here on a trading expedition. I have been three times to Kerepunu, and have seen most of the tribes from Yule Island to China Straits, but I certainly could not assert that the Kerepunites are the finest or handsomest race I have seen.

"I am, yours very truly,

"W. G. LAWES."

JACOPO DE' BARBARJ.

Paris: September 18, 1876.

I was greatly surprised to read my name once more in the *ACADEMY* of September 9 after my statement in the previous number. I there said that my part must be limited to what I had done in making mention in one of my letters of a book, the result of conscientious study and full of new facts, which drew attention to one of those masters, half-Italian half-German, who impress so unique and peculiar a character on the earliest engraved works of the Venetian School. Some days after, this letter rather than the book having been a little rashly assailed, I had to refer my critic to the book itself.

Now I am accused on the ground, not of what I have said, but of what I ought to have said. The subject of discussion is no longer the bronze bas-relief, which I know well, having the honour of often visiting M. Dreyfus' collection, so rich in marbles and bronzes of the most brilliant moment of the Italian Renaissance. We are now concerned chiefly with the two ink-stands, which I do not know. I must beg leave to withdraw.

Let Mr. Drury Fortnum publish a work on his ink-stands and on the elder Vischer, to whom he ascribes them, and I shall be most happy to review it. The first years of the German Renaissance are still as a rule but little known, and the

Italian, German, or French bronze bas-reliefs especially cause great confusion when any attempt is made to refer them with precision to their authors. Meanwhile, as I have no new texts to bring forward for the education of amateurs, and as I think that personal controversies take up space in the *Reviews* which is already very scanty for the insertion of original articles, I hasten to yield the pen to the person who is the primary cause of this discussion. This polemic to which the *ACADEMY* opens its columns has been hitherto profitable for the public; but my name, by coming so often before your readers' eyes, might in the end cause them to forget the names of the late Emile Galichon and M. Charles Ephrussi. It is they who are the real originators of the attention paid in our days to Jacopo de' Barbarj, whose very nationality was unknown. Such a substitution would be an injustice. PH. BURTY.

"Dear M. Burty,

"You ask me to take up my pen in order to answer in my own name to the fresh rectification brought forward in the *ACADEMY* for September 16 last, on the subject of my study on Jacopo de' Barbarj. I am there accused of having confounded the emblem of Peter Vischer, the two impaled fishes, with that of Jacopo, the Caduceus, and of having without any other reason attributed to the latter a bronze bas-relief by the former. It is now recognised that this bas-relief, *Orpheus and Eurydice*, is not by Barbarj, and is not signed with the Caduceus, but with the two impaled fishes. I make no difficulty in admitting this, but I maintain that the cause of my error was not "only" the apparent analogy of the emblems, and that it would be an error to refuse to see in the bas-relief in question a close affinity between the manner of its author and that of Jacopo. And since in connexion with this bronze there has been much mention of Peter Vischer, perhaps I may be permitted to give, through the medium of the *ACADEMY*, some facts which are still but little known with regard to that artist and his family.

"As you have said in your reply, Prof. Bergau has established that the *Archer* or *Apollo* (a little bronze fountain) of the Germanic Museum of Nuremberg, which came from Peter Vischer's studio, was modelled after Jacopo's engraving of *Apollo and Diana*. Dr. Lübke shares this opinion. It is then admitted that Jacopo was known to the Vischers, who once at least worked from his designs. I believe for my own part that they borrowed more than once from the Venetian artist. Here are my reasons.

"It is known that Barbarj long resided at Nuremberg (and I propose to give details on his stay there in a forthcoming Study), that he had disciples there, and that Hieronymus Hopper copied several of his engravings, among others the *Apollo and Diana*. As to the influence of Jacopo on Albert Dürer, I must refer the reader to Dr. Thausing's magnificent work, *Dürer: Geschichte seines Lebens und seiner Kunst*, which is a perfect treasury of learning. It is, therefore, indisputable that this master played an important part at Nuremberg.

"On the other hand, Dr. Lübke has pointed out Italian inspiration in some works of Vischer of an advanced epoch, notably in the two ink-stands mentioned, of which I have seen photographs in Paris. The first of these objects is marked with the two impaled fishes. The other bears the letters P. V., a Latin inscription, the impaled fishes, and the date 1525. Dr. Lübke places the first between 1510 and 1515, and recognises in it the artistic tendencies of Andrea Sansovino. The second appears to him more Italian in style.

"Now, none of the important pieces by Peter Vischer of undoubted authenticity—neither the sepulchral copper bas-reliefs of Breslau, of Magdeburg, of Bamberg, nor his admirable works at Prague, at Cracow, at Nuremberg and elsewhere—bear the mark of the impaled fishes. The art in

all these works is of an essentially Germanic type; the Italian manner nowhere betrays itself.

"It is quite otherwise with the later works of the Nuremberg metal-founder, which may be th us explained. Peter Vischer had five sons—Hermann, Peter, Hanns, Paulus and Jacob—who, according to Neudörfer, lived with him even after their marriage, and formed the busiest workshop in the town. Hermann, as Neudörfer also tells us, went at his own expense to Italy for purposes of art, pushed on to Rome, and brought back many 'artistic objects that he had made and designed there, which greatly pleased his aged father and was of great use to his brothers.' This journey must evidently be placed between 1515 and 1516, as it was made after the death of Hermann's wife, which took place in 1515, while Hermann himself died in 1516. Peter Vischer the younger died in 1528; Paulus emigrated to Mayence, where he established himself and died about 1531. We hear nothing of Jacob after 1530. Hanns only, whose name is found in numerous documents, one of which belongs to the year 1549, can have assumed the management of the Nuremberg studio after his father's death, which happened in January, 1529. (See the extracts from the public archives collected by the learned and indefatigable archivist of Nuremberg, Dr. Lochner, in his reprint of Neudörfer.) It is therefore to Hanns that we must attribute the *Archer*, dated 1532, and executed beyond a doubt from the design of 1531, which belonged to the Galichon collection, a design by a hand hitherto undetermined reproducing the *Apollo* of Jacopo.

"The influence of the Venetian Master will likewise be found in the famous *grille* of the Townhall of Nuremberg, which has disappeared, but the composition of which is known to us by drawings preserved in that city. It contains figures which are strikingly like a pen-and-ink drawing in the Collection of Prints at Dresden, *Two Tritons Caressing a Nymph*, a drawing which is the pendant of the *Battle of the Tritons*, and a facsimile of which accompanies my lately published study on Jacopo de' Barbarj. This *grille*, for which Peter Vischer and his sons received the commission, was only finished by Hanns in 1540.

"Thus the *Archer*, the *grille*, executed in great part at least by Hanns, and the important text of Neudörfer, according to which the studies brought back from Italy by Hermann "were of great use to his brothers," all concur to prove that the *Italianised* pieces in Vischer's work are due to the sons far rather than to the father, who is so thoroughly German in his important productions.

"From what precedes it might be inferred that the first of the ink-stands mentioned above, marked with the two impaled fishes, is one of the studies brought back from Italy by Hermann. The second, signed P. V., with the impaled fishes, is by Peter Vischer the younger. As we have said, none of the works of Peter Vischer the elder bear this emblem. The latter uses a cross, the lower portion of which ends in a hook; and his initials, which occur on the seal of a document dated November, 1493, are the letters P.V. enlaced. So the two bas-reliefs representing, with variations in style rather than composition, *Orpheus and Eurydice*, one in the Dreyfus collection, and the other in the Berlin Museum, and both bearing the impaled fishes, must be attributed to Vischer's sons. That of the Dreyfus collection shows more directly, as we have mentioned, the influence of Jacopo's style.

"Here I must stop, my object being to present the reasons which caused my first error, and to add some information which I have reason to believe is little known with regard to the interesting family of Vischer. Such is my excuse for this long letter, which you are good enough to transmit to the Editor of the *ACADEMY*.

"Believe me,

"Yours very truly,

"CHARLES EPHRUSSI."

PHYSIOLOGY OF CONSONANTS.

140 Maids Vale, W. : Sept. 19, 1876.

As Mr. Rhys's criticism of Lefler's Consonant Investigations in the last number of the *ACADEMY* (p. 293) is, in many respects, misleading, I think it advisable to supplement his remarks by some more of my own.

A self-evident principle in phonetic discussions is that we should first of all settle definitely what are the facts we are discussing. It is not at all uncommon to see phoneticians carrying on long controversies about what are really totally distinct sounds. Thus a North German phonetician will waste quires of paper in proving, against a South German investigator, that German *w* is formed by the teeth and lips, not by the lips alone. The truth is that they are describing two distinct sounds which happen to be denoted by the same letter, and their descriptions are both perfectly correct: North German *w* is a dento-labial; South German *w* a pure labial. In the same way, if Mr. Lefler, before writing his 118 pp. of criticism on the views of Brücke, Ellis, Bell, Max Müller, Corssen (!) and a host of others, had taken the trouble to listen to the pronunciation of any German or Englishman, and compare it with his own Swedish pronunciation, his essay would have shrunk to very small proportions. The facts of the case are simply these:—

The English and German double consonants are pronounced as single consonants: English *t* and *tt* in *pity* and *petty*, for instance, are both pronounced single, as also in German *bitte*. Double consonants only occur in English and German when two separate words come together, as in *soappot* compared with *soapy*, and in German *bett-such*. In Swedish double written consonants are always pronounced double, the two *p*'s in *tappa*, for instance, being pronounced as in *soappot*, not as in *soapy*. The Swedes are thus unable, without considerable practice, to pronounce single consonants before short vowels, and consequently import their double consonants into their pronunciation of English, French, and German, which produces a very curious effect. Mr. Lefler, if asked to give the true pronunciation of English *soapy*, would probably come out with something like *soap-pæa*.

The very innocent distinction between "implosive" and "explosive" *p* is an old one; nor did we require Mr. Lefler to prove that in English *top* we first close and then open the lips. It is perfectly clear that there are three elements in every stopped consonant: 1) the stop itself; 2) the transition, or "glide" from the preceding sound; and 3) the glide from the stop to the next sound. We may distinguish them as *stop*, *fore-glide* and *after-glide*. The fore-glide is, of course, inaudible at the beginning of a word, but in such a group as *apa* all three elements are present. If, then, we follow out Mr. Lefler's principles consistently, we ought to assume three *p*'s in *apa*. The assertion that "after a long vowel most people sound no implosive *p*, &c., but only the explosives corresponding," is, I think, simply unmeaning. Do we omit to make the glide from the vowel to the consonant after a long vowel? Certainly not in English. The difficulty of distinguishing the consonant in *op*, &c., as opposed to *öp*, when pronounced without the after-glide, is simply due to the diminishing force with which we pronounce long vowels, which makes any consonant which comes at the end less distinct; but it is quite easy to pronounce the *p* in *öp* with the same force as in *op*.

All of the three elements of a stopped consonant can be modified in a great variety of ways, many of which are as yet imperfectly understood. Great confusion is produced by phoneticians copying hasty and inaccurate analyses of sounds from other writers without verification, and making dogmatic statements about sounds which they are unable to pronounce accurately themselves.

In English medial *g*, for instance, as in *ago*, all three elements are voiced (sonant), the stop and the two glides; in *beg* the fore-glide and

stop are voiced, the after-glide is breathed (surd). In *go* the stop is sometimes voiced, but often quite voiceless, the after-glide is voiced. In *cold* the stop is voiceless, and the glide is breathed—that is, the glottis is not narrowed to produce voice till after the stop is opened, so that there is a slight escape of breath. Medial and final *k* are formed in precisely the same way. These remarks apply not only to English but also to French, Italian, Swedish, and, in fact, nearly all the languages of civilised Europe except South Germany.

If we agree to call all stopped consonants with vocal stop "mediae," and all consonants with voiceless stop and breath after-glide "tenues," we may describe those in which the stop is voiceless and the glide vocal as "half-tenues," and we shall have a terminology with which certain facts can be intelligibly discussed.

These names are simply a matter of convenience; all we want is to settle definitely what we mean by them. Mr. Lefler's principle apparently is that any sound which may happen to be denoted by a *b* in any language whatever is a *media*. If, then, a German Saxon pronounces his *b* exactly like a *p*, without any voice, it follows, according to Mr. Lefler, that *mediae* can be pronounced without voice. The question is, Has the word "*media*" any meaning at all, or not? and, if it has, what meaning shall we agree to give it? If we agree to accept "*media*" as a name for a voiced stop, then we simply have to say that in some parts of Germany there are no *mediae* at all, and that a different sound is substituted for them.

Mr. Lefler states that in Swedish *p*, *t*, and *k* are sometimes pronounced with the tone. This simply means that *p*, *t*, and *k* are sometimes changed into the *mediae*, or possibly half-*mediae*, *b*, *d*, and *g*. The statement is probably quite incorrect.

HENRY SWEET.

"JUGGERNAUT" CALLED IN QUESTION.

Aberdeen : Sept. 23, 1876.

In a lecture recently delivered by Mr. Moncure Conway, reference is made to the famous temple of Jugernath and the alleged self-immolation practised at the festivals held there. The lecturer adds, "we have now learned, on the best authority, that all those pictures of Hindoos casting themselves beneath the Jugernath car to be crushed were purely imaginary." The authority is not stated.

An Indian Civil servant, Mr. James Geddes, who had been resident magistrate at Orissa, where the festival is held, informed me, from his own knowledge, that no trace of the practice of immolation could be found in the public records of the district. The festival is intensely thronged, and accidents are not unfrequent: so much so that the magistrate has to interfere for the preservation of order, and has often to punish the priests in charge for culpable remissness; and this is, according to Mr. Geddes, the whole fact underlying the bad reputation of the festival.

I had an opportunity of mentioning to the late Mr. John Stuart Mill what Mr. Geddes had stated. Mr. Mill expressed his doubts on the point. He said that among his oldest recollections of the India House were motions in the Court of Proprietors for putting down the horrors of Jugernath; and, although he could not speak from definite knowledge, he was under the impression that there had really been such scenes as are popularly represented, and that at some time or other the Indian Government had interfered to prevent them. Doubtless, if any such interference had ever occurred, it must be recorded in the minutes of the Court of Directors.

If I may judge from an article in the carefully-edited *Encyclopædia* of Chambers, even this qualified supposition of Mr. Mill's does not represent the received and prevailing views. The writer of the article "*Juggernaut*" says that the

self-immolation of the worshippers, "which, in former times, prevailed to a fearful extent, is greatly abating in our days;" implying that it still exists in a sufficient degree to inspire our pity and repugnance.

On turning to James Mill's *History of India*, I find the received view given with unstinted horrors. "Numbers of the congregated people threw themselves under the chariot wheels, and even fathers and mothers with children in their arms." We know that the author wrote under a reaction from the over-done adulation bestowed by Sir William Jones and others on the character and institutions of the Hindoos, and in consequence did not always do full justice to these; but his editor, Wilson, is disposed to bend the bow the other way. His note on the above passage is a smart contradiction; although I can suppose it intended more to give pain to Mill than to give pleasure to Jugernath. This is the note:—

"It is no little exaggeration to say that 'numbers of the congregated people throw themselves under the chariot wheels.' Mr. Stirling, who was resident in Orissa for four years, mentions that during that period there were no more than three such immolations, and of these one was possibly unintentional, while the other two were cases of painful and incurable disease. But this practice is modern. Jagannath himself is modern, and has no place even in the Vaishnava Puranas. It is not improbable that the present shrine attained reputation as a place of pilgrimage no longer ago than a century."

This so far corroborates Mr. Geddes's experience; but the idea is still allowed in the case of those two unfortunate who had recourse to the car for their *ekhanasia*.

The account given by James Mill himself is supported by the authority of eye-witnesses, and these not solely the missionaries, who might be tempted to make capital out of the institution.

It seems very desirable that the exact truth should be ascertained on a topic that has so often stirred the depths of our sympathetic emotions. The "car of Juggernaut" had in it the fair promise of being an oratorical terror to all time; and if the great idol can be restored to our favour, or at least to our indifference, let the thing be done efficiently and soon.*

A. BAIN.

SCIENCE.

Weather Charts and Storm Warnings. By Robert H. Scott, M.A., F.R.S., Director of the Meteorological Office. (London: Henry S. King & Co., 1876.)

At the time of our taking up this book it was raining heavily, and dark gloomy clouds, scudding rapidly before the wind across the sky, presaged an impending stormy night; yet, glancing at the barometer, we saw the index standing at "Fair."

Experience of this nature is by no means unfamiliar to all of us, and, as the weather is such a general topic in every Englishman's conversation, any aid which will enable us to arrive at a more satisfactory prediction of coming weather than that provided by the traditional inscription, which still holds its place, in spite of the far more correct legend introduced by the late Admiral FitzRoy, upon the face of most barometers, will be welcomed by all.

That this is evident is proved by the fact that nowadays most of the chief newspapers furnish their readers regularly with tables,

* I am not answerable for the spelling of the name of the great idol. When not quoting, I have taken Mr. Conway's rendering as the latest, although probably destined to be superseded, like the others. In the spelling of Oriental names, it is not given us ever to find repose.

charts, or diagrams indicating in some way or another the changes occurring in the various meteorological elements.

For instance, as is well known, the *Times* publishes daily, at a considerable cost, a small chart in which the salient features of the meteorological observations made at stations all round the coasts of our own and neighbouring countries are admirably brought before the eye in a clearly-defined manner, together with a paragraph giving concisely a general statement of the appearance of the weather over our isles.

Besides this chart, there is a series of four charts often to be seen exhibited in shop windows, and at many public buildings, which, being drawn and lithographed daily, is widely circulated by the Meteorological Office, and it is in a great measure to the study of these maps that we must look for information of future weather.

Although they attract considerable attention, yet but few people are sufficiently conversant with Meteorological Science to be able to fully understand them, and it is, therefore, with much pleasure that we see the work now before us brought out.

It has been drawn up by the Director of the Meteorological Office with the view of providing a guide to this study, and enabling every one to see for himself the processes, generally regarded as very abstruse and mysterious, by which the Meteorological Office has been able to attain the success in storm warnings which is stated in the reports to Parliament to have amounted for the past two years to as much as eighty per cent. of the storms which have passed over England, and to cent. per cent. of those which have traversed the North Sea, and reached the German coast.

In the weather charts the proper use of the barometer as a guide to the movements of the atmosphere becomes at once evident, and we have in the *isobars*, or lines drawn connecting those places where the corrected barometric pressure is the same, the most certain of indicators of the whereabouts of any storm.

But in order to avail ourselves of their indications an acquaintance with various meteorological laws is necessary. We must know Buys Ballot's law, that "if you stand with your back to the wind the barometer will be lower on your left hand than on your right;" also that the greater the difference of pressure between two stations, or, as it is technically expressed, the steeper the barometric gradient along the line joining them, the more strongly the wind will blow across it. Thirdly, Dove's Law of Gyration, which states that in these latitudes the wind changes more frequently with the sun than in the opposite direction.

But a knowledge of the distribution of atmospheric pressure is insufficient in itself for our purpose. Indications of the temperature and dryness of the air in different parts of the country, together with the changes these elements are experiencing, are also needed, as well as other information as to wind, clouds, rain, and sea-disturbance.

All of these data are embodied in the Meteorological Office charts in a simple and concise manner, and Mr. Scott's work, without being dry or technical, is admirably

adapted to afford the public, who are not, as a rule, familiar with the subject, a means of combining together these various facts in such a manner as to be able to make use of them for the purpose of obtaining for themselves some amount of foresight of approaching weather.

It is, however, somewhat disheartening to find that the author speaks very doubtfully of the possibility of our attaining in this country any success in foretelling the approach of storms before they arrive within a short distance of our western shores,* and that also when they have reached the coast we cannot be sure of the direction they will take, and therefore occasionally the wrong places may be warned.

The path of one of these erratic storms—viz., that of April, 1872—seems to have been very remarkable, for, instead of travelling across Ireland and Scotland in a northeasterly direction as expected, this storm ran south down to the Bay of Biscay, then turning abruptly went eastward as far as Cherbourg, where it doubled back upon its track, returning to Ireland, which it again traversed, but in the opposite direction, thus completely upsetting all the calculations made of its probable movements.

There is one chapter in the book with which every one at all concerned in maritime affairs should certainly make himself acquainted, and that is the one giving the meaning of the various storm-signals which are hoisted round the coast on receipt of instructions from the Meteorological Office on account of impending or approaching storms.

We would suggest that in a new edition of the work an appendix might be advantageously added, in which the principal rules to be employed in predicting weather by the aid of the charts, concisely stated, were collected together for reference.

The book appears to be carefully and accurately printed, and the numerous illustrations, which have been executed by the same process as that employed for the engraving of newspaper charts, are so clear that we are induced to hope, seeing how rapidly they are produced, that daily illustrated journals will soon be as common as weeklies now are. G. M. WHIPPLE.

SCIENCE NOTES.

BOTANY.

The Flora of Guadalupe Island.—Just ten years ago Dr. Hooker delivered before the British Association his interesting lecture on Insular Floras. Since then the *Challenger* and *Novara* expeditions have added considerably to our knowledge of the vegetation of the remote islands of the Atlantic and South Indian Oceans. The particulars concerning Kerguelen's Land, Amsterdam and St. Paul Islands, the Crozet, Marion, and Tristan d'Acunha groups, Fernando de Noronha, and St. Paul's Rocks, will be found in the fourteenth and fifteenth volumes of the *Journal of the Linnean Society*. But the most noteworthy discovery was made by Captain Goodenough, of H.M.S. *Pearl*, who landed on Amsterdam Island, and brought away specimens of the small tree forming the whole of the woody vegetation of the island.

* This is due to the impossibility, or at any rate great difficulty, of establishing look-out stations westward of the Irish coast—viz., in the Atlantic, whence in reality our weather generally comes.

This proved to be *Phyllica arborea*, previously found only in Tristan d'Acunha, some 5,000 miles distant! The Americans have also recently done some good work in this direction, in exploring the island of Guadalupe. In the *Proceedings of the American Academy of Arts and Sciences*, vol. iii., new series, Mr. Sereno Watson gives an enumeration of the plants collected there by Dr. E. Palmer. The flora of this island is no less remarkable than that of the Galapagos Islands, particularly in its relations to the flora of the nearest mainland. The island of Guadalupe is in latitude 29° north, about 100 miles from the coast of Lower California. It is twenty-six miles in length in a north and south direction, with an average breadth of ten miles, and is traversed by a mountain ridge, the central peak (Mount Augusta) having an elevation of 3,900 feet above the level of the sea. It is exceedingly rocky, the rocks being of volcanic origin. Fogs are very prevalent, and ice an inch in thickness, accompanied by two inches of snow, was observed in the middle of the island in December, 1874. Here, as in St. Helena, though fortunately not to the same extent, the indigenous plants have suffered much from the goats with which the island is over-run. Who originally introduced the goats is uncertain, but now a Company exists for breeding them. Mr. Palmer's collection of plants contains in all 131 species, including 102 exogens and eight endogens, the remaining twenty-one belonging to the higher cryptogamic orders. The 100 phænogamous species Mr. Watson divides into five groups: (1) introduced species, of which there are twelve; (2) those which range from the Pacific to the Atlantic States, of which there are nine; (3) those which are found throughout California, or at least as far north as San Francisco, numbering forty-nine; (4) those found only in Southern California, below Los Angeles, or in Arizona, numbering eighteen; and (5) those peculiar to the island itself, of which there are twenty-one. It is singular that not one of these species is peculiar to Lower California, the nearest mainland, or Mexico. The flora is exclusively Californian in its character, yet the island lies 230 miles distant from the southern line of California. The arborescent vegetation consists of *Quercus chrysolepis*, *Pinus insignis*, *Juniperus californica* and *Cupressus macrocarpa*. The new plants are: *Thysanocarpus erectus*, *Lavatera occidentalis*, *Sphaeralcea sulphurea*, *Lupinus niveus*, *Trifolium Palmeri*, *Heuchera* sp., *Oenothera guadalupensis*, *Megarrhiza guadalupensis*, *Galium angulosum*, *Diplostephium canum*, *Hemigonion frutescens*, *Perityle incana*, *Bacria Palmeri*, *Senecio Palmeri*, *Mimulus latifolius*, *Calamintha Palmeri*, *Phacelia phyllomanica*, *Atriplex Palmeri*, *Brahea edulis*; and *Harpagoneella Palmeri* (*Boraginaceae*), and *Hesperelaea Palmeri* (*Oleaceae*) new genera. The only palm, "and the only thing on the island having a tropical look," is frequent in warm ravines throughout the island. It attains a height of about forty feet, with an average diameter of fifteen inches. Each tree bears one to four clusters of fruit, four feet in length, and each weighing forty or fifty pounds. The fruit is eaten by man, goats, birds, and mice.

Compositae Indicae.—Mr. C. B. Clarke, formerly Director of the Botanic Gardens, Calcutta, has published in a separate form the *Compositae Indicae Descriptae et secus Genera Benthamii Ordinatae*. This volume, the result of much labour, and the preparation and publication of which has been beset with difficulties, will be very useful during the period that must elapse before Dr. Hooker's *Flora of India* reaches this part of the natural system. Nevertheless, it seems a pity that so much time should have been thrown away, as one might say, on a work of a temporary character, as this must necessarily be. It must be perfectly obvious to any one at all acquainted with the literature of systematic botany, that it is impossible in India even for the most accomplished botanist to produce a monograph of the most numerous family in the vegetable kingdom

which shall possess any permanent value. If Mr. Clarke could have visited Europe and revised his work before publication, he would not have had to experience the mortification now probably in store for him, of his work being superseded soon after its appearance. It is with no disposition to find fault that we make these remarks, and we should be pleased if Mr. Clarke could come home and undertake the same family for the *Flora of India*, and thus obtain the slight reward attainable by a worker in systematic botany. In spite of this drawback, the monograph is a valuable contribution to our knowledge of the approximate number of forms of the *Compositae* distributed over the Indian region. In the *ACADEMY* for April 29, 1876, we summarised the species of this family described in Boissier's *Flora Orientalis*. In that work, which includes the eastern part of the Mediterranean region—that is, all the country lying between Greece and Egypt on the west and the Indies to the east—1,654 species, belonging to 172 genera, are enumerated. For the Indian region, which includes as much of the eastern peninsula as drains into the Indian Ocean, Mr. Clarke tabulates 556 species, belonging to 124 genera. Tables are given showing the distribution of the genera and species in India, which is divided into nine districts, and their general distribution where they extend to other countries. It is a curious fact that nearly all the Indian genera of the *Helianthoideae* extend to America, whereas none of the Indian genera of *Mutisieae* are found in America.

The Flora of British India.—The fourth part of this work has appeared. It contains the *Anacardiaceae*, *Sabiaceae*, *Coriariaceae*, *Moringeae*, *Connaraceae*, and 89 out of 132 genera of the *Leguminosae* represented in India.

North American Botany.—Besides the flora of the island of Guadalupe, separately noticed, the ninth volume of the *Proceedings of the American Academy of Arts and Sciences* contains various "Botanical Notes," relating to North American plants, by Dr. Asa Gray. Among the more interesting new plants are *Palmerella*, a new genus of *Lobeliaceae*, from Lower California; *Echidocarya*, *Boraginaceae*, from Arizona; a monograph of the genera *Collinsia* *Mimulus* (North American species) and *Monardella*. Mr. Sereno Watson contributes a revision of the North American species of *Trifolium*, *Lupinus*, and *Peucedanum*.

Geschichte der Botanik.—Dr. Julius Sachs, the author of the well-known botanical text-book, last year completed a History of Botany from the sixteenth century down to 1860. The matter is arranged in three "Books," and is very convenient for reference. The first book is devoted to Morphology and Systematic Botany, divided into five chapters with descriptive headings; the second to Vegetable Anatomy, in four chapters; and the third to Vegetable Physiology, in three chapters, subdivided into numerous paragraphs. The author says in his preface that his object has been to give special prominence to those men who have not simply determined certain facts, but who have fully comprehended the significance of facts. Scientific merit is only due to those who have investigated facts.

"For this reason," he adds, "I attach little value to certain utterances of earlier writers, whom some please to call the originators of the theory of descent. It is an undoubted fact that previous to the appearance of Darwin's work, in 1859, the theory of descent possessed no scientific importance; it was he, indeed, who gave it its importance. In this, as in other things, it seems to me in the interest of truth and justice that we should not award merits to former writers, who, if they were alive now, would probably lay no claim to them."

This method of treating the subject is very different from that adopted by a writer on botanical problems in the *Rundschau*, where Aristotle and his pupils are accredited with having known nearly as much as is known at the present day.

Perhaps it may be thought that undue prominence is given to certain investigators; but the student will find the work very useful. It is concise and clear, and possesses the great recommendation of a good paged table of contents, and an index of names.

Bursulla Crystallina.—Under this name, Professor Sorokine describes a new genus of *Myxomycetes* in the *Annales des Sciences Naturelles*, sér. 6, vol. iii., part 1. This organism was discovered on horse-dung, and is nearly related to the curious *Guttulina rosea* of Cienkowski, differing chiefly in the presence of a common membrane in the organs of fructification. In watching the development of this organism, Prof. Sorokine stumbled upon an interesting fact. Wishing to ascertain the effects of a low temperature upon it he placed some of it in the open air during the month of December, when the thermometer ranged between 5°-5 and 23° below zero Fahr. A few days afterwards he observed that some of the sporanges contained portions of protoplasm and a distinct nucleus exactly in the centre of these fragments. Thus, although there are two kinds of organs of fructification produced on the surface of the dung, it is easy to distinguish them by the presence of a nucleus in the organs of later formations. Nevertheless, the writer was unable to determine which sexual part each of these two kinds played. They are quite distinct, and the result of their union is the formation of a cellule which may be termed an oosphere.

The Anthericeae and Eriospemeae.—Mr. Baker's rapidly-following series of monographs of the various tribes of the large order of *Liliaceae* has recently been enriched by the two tribes named. This paper occupies the whole of No. 82 of the *Linnean Society's Journal*. The *Eriospemeae* consist of a single genus of twenty species; and the *Anthericeae* comprise twenty-six genera and two hundred and thirty-nine species. Thirteen of these genera are monotypic, while *Anthericum* itself includes eighty-two species. The most important generic characters are furnished by the modifications of the androecium, which are often exceedingly elegant. Altogether this monograph is an important contribution to science, as a large proportion of the species had not previously been described.

PHILOLOGY.

THE Philologus (Leutsch), vol. xxxv. part 3, contains several valuable articles, among which Ahrens' paper on ancient weaving ("Die Webstühle der Alten"), Metzger's on the second Pythian of Pindar, Vollbrecht's on Xenophon's account of the expedition against the Drilae, and Fritzche's communication on Guyet's marginal notes to Horace deserve especial mention. There is also an interesting paper by Wegener on the fifth *Odyssey*, and a long series of emendations in Statius by Köstlin.

THE June number of the *Zeitschrift für die Oesterreichischen Gymnasien* contains two essays on the Wallachians, one being the conclusion of Julius Jung's three articles on "Die Anfänge der Römänen," the other "Zur Walachischen Frage," by W. Tomaschek. In the July number De la Roche continues (from the *Gymnasial Zeitung*, 1874, p. 405) his grammatical essays, discussing on this occasion the use of the conjunctive in dependent sentences in Homer. G. Meyer has a short paper on the newly-discovered Olympian inscription; from which, he says, it would seem that the dialect of Elis cannot be decidedly referred to the Dorian or the Aeolic, but shares some of the peculiarities of both, while in other points it goes its own way. In the August number J. Rohrmoser has a good paper on the conduct of Demosthenes in the matter of Harpalus. Goldbacher discusses a fragment of Heraclitus, and Hümer the date of the composition and publication of Sedulius' *Carmen Paschale*. The short re-

views in these numbers are too numerous to mention in detail. There are two good educational articles, one in the June number upon afternoon work in German schools, by A. Egger, the other in the July number, by Karl Tomaschek, on the Berlin Conference for the discussion of modern German orthography.

IN the *Neue Jahrbücher* (Fleckeisen and Masius), vol. cxiii., part 6, the most important original articles appear to be Düntzer's on the medical use of *aptus* and other words of kindred meaning, and Unger's on the poems entitled *κατὰ λεπτὸν*. The rest of the number is mainly taken up with reviews, among which we may mention Schubart's article on the most recent criticisms of Pausanias, and Teuffel's on the newest editions of Plato's *Symposium*. In the following number R. Förster continues his important essay on the works of Libanius. Hahn has an interesting paper on the second Athenian confederacy. K. Meyhoff contributes a very favourable review of Weil's Demosthenes, and A. Römer has a long article on Dindorf's edition of the *Scholia* on the *Iliad*. The educational section in the first of the numbers is mostly taken up with reviews, the most interesting of which is Hess' article (in continuation) on Kern's *Life of Giesebrecht*. Eichhoff's "Aphorismen aus der Schulpraxis" contains a number of sensible observations. The same may be said of the anonymous "Noctes Scholasticae," with which the educational section of the following number opens. In this section Prühle continues his publication of the letters of Lessing, Ebert, &c.

THE *Zeitschrift der Deutschen Morgenländischen Gesellschaft*, vol. xxx. part 1, opens with an essay by Oppert "On the Language of the Ancient Medes," in which he gives his support to the view that the language of the second class of cuneiform inscriptions is *Medic*. A. F. Pott contributes a most valuable and exhaustive philological excursus on the orthography of "Chemie or Chymie," and decides against the derivation of *χημεία* from *χυμός*, and in favour of the explanation that *χημεία* is derived from *χημία*, *black*, the ancient name of Egypt, the land of "Cham," the *black*, or *hot*, "son" of Noah. D. H. Müller's paper on "The Status Constructus in Himyaritic" draws attention to some important divergences in the use of the mode in this language as compared with Arabic and Hebrew. The same scholar also contributes a drawing and description of a Himyaritic stele. W. Bacher traces a story in the *Arabian Nights* to the *Miles Gloriosus* of Plautus. Jul. Euting continues his "Inscriptional Contributions" with the exceedingly beautiful inscription of Jebel, of which a lithographic plate is added. The other papers are "Two Himyaritic Inscriptions," by J. H. Mordtmann; "Philosophical Poems of Abu-l-Alá Ma'arri," with translations, by A. von Kremer; "On the Pronunciation and Writing of the Old Armenian," by H. Hübschmann; "On the Greek Origin of the Armenian Character," by V. Gardthausen; "Studies on Sa'di," by W. Bacher; "Explanation of Thibetan Words and Names," by H. A. Jäschke, &c.

FINE ART.

CHARDIN.

Jean Baptiste Siméon Chardin. Catalogue Raisonné. Par Emmanuel Bocher. (Paris: Librairie des Bibliophiles, 1876.)

THE work before us is one of a series in which will be recorded with minute care the engravings after the now admired, the not long since neglected masters of the French School of the eighteenth century; and the master to whom this honour is in the present case paid, by the publication of a goodly volume full of facts and criticisms, is the painter Chardin. The revived appreciation

of his pictures in France has not yet made him known familiarly in England. Our National Gallery, so miserably poor in French pictures that it has not even got a Watteau, is of course without a Chardin. Dulwich, indeed, has the reputation of having one: it must be one of several versions of the *Serinette*, exhibited at the Louvre in 1751, and at Dulwich it has appeared under the title of *Woman with a Barrel-Organ*. Stafford House, too, possesses two Chardins: the first, a portrait of the painter; the second, of D'Alembert. But, generally, Chardin is not known. The name is unfamiliar here; and, the pictures themselves being held of little account, the prints after them are not sought for by many with eagerness.

And yet the art of Chardin, or even that part of it which these prints might make us know, has its own distinctive character and charm. Like most good things, it is finely original, and quietly fascinating. And it has been admirably reproduced. Chardin was, indeed, hardly as fortunate in having his things multiplied by Cars and Lepicié as Sir Joshua in being "immortalised," as he said himself, by the work of McArdell and Valentine Green; but at least the art employed was in each case excellently adapted to the qualities that had to be rendered. One cannot in Chardin's case say "perfectly," for etching would succeed doubtless in giving to the reproduction an amount of "colour" which no line-engraving can hope to give, and it would give also a subtlety of light and shade, combined with a definiteness in the forms of objects, which mezzotint could not attain. Why does not such an etcher as M. Waltner, who feels, as I happen to know, the qualities of Chardin very keenly, set himself to render them in his own art? But, on the whole, the existing reproductions—or the best among them—are in a high sense satisfactory and delightful. Colour, or what the engraver calls colour, they possess in a large measure, and they are entirely successful in their rendering of that sentiment and expression for which such works of Chardin as they translate are in the main charming. The etchings are wanted as the complement of these.

M. Bocher's book tells nothing of the painter's life, for the very good reason that it was not within M. Bocher's province to tell anything. But the life has been told elsewhere. The brothers De Goncourt, turning over on our behalf the dusty files of the *Mercur de France*, ransacking the catalogues of eighteenth-century picture-sales, reading ignored *Mémoires*, bringing out as the least of their labours from the mass of Diderot's criticism such parts as were devoted to praise and comment on Chardin, have discovered and compiled much; and, though their discoveries do not prove the painter of *bourgeois* manners to have lived any other than the uneventful *bourgeois* life, they have made an interesting chapter in the work devoted to the illumination of these eighteenth-century names hidden too long in darkness.

Chardin was born in Paris in the last year of the seventeenth century, the son of a tradesman and artisan. Entering the

studio of Cazes he began by painting that which has no kinship whatever with the work by which he became known. But it chanced soon that Coppel wanted his assistance, and set him to paint a gun. Astonished, so goes the story, at Coppel's pains in the placing and lighting of the gun, Chardin set to with a will. He was now for the first time painting from nature; the charm and interest of reality laid strong hold upon him. It was some little time ere he was well before the public, but when once an exhibitor, he was at once appreciated. A fresh painter of still-life had arisen in him; Jean Baptiste Vanloo bought a picture of a *bas-relief* in bronze which the young man had sent to the Exhibition in the Place Dauphine, and paid him for it better than had been hoped. In 1721 Chardin exhibited *The Skate*, which by common consent was declared a masterpiece in still-life painting. It may be seen at the Louvre. That and many others grouped together by the painter when M. Largillière went to see his things, imposed upon a worthy judge, who took them for the work of "some good Dutchman" and held them up to Chardin as models for his own work. The fact that they were themselves his work being presently made known, the young man was asked to present himself for election, and he was soon a member of the Academy. A life of calm and moderate prosperity was, doubtless, in store for him. He was a man of quiet mind. He had married early. His wife died young. He married a second time. He had a son, who followed him for a while at a distance in his art, and died before him, leaving him then childless. Social and professional engagements grew on him. He was for twenty years the hanger of pictures at the Exhibition, making of course enemies, but at least commended for the humble places chosen by him for his own works. He did not receive high prices, for his art was not of the kind sought after at Court, and rich and liberal patrons of the middle class were necessarily most few. But with a second order of pictures, later on to be mentioned, he succeeded in reaching a popularity denied to the first, which itself ought to have been popular. For there is nowhere a greater painter of still life than Chardin; there is no one, perhaps, who has given you quite so well as he a reality without meanness, an arrangement without pretension or artifice. The very composition of his groups of household things is good. Nothing is put thoughtlessly into his pictures, out of mere pride that he is able to paint so well whatever object and substance he chooses. The simple materials gathered by him on his kitchen-slab have their place there of right, and tell the story of modest and frugal provision. Here in one picture is exactly the material for the humblest meal and the things that are required to prepare it—that and no more. Here, in another, the fruits for the dessert of the rich, and with them the silver, the gold, the china sugar-bowl of famous Dresden. The drawing of these things is excellent: the roundness and relief astonishing for truth. Still life has perhaps not before, and certainly has not since, been painted with such a perfect and sober veracity. These pictures, eight or ten of

which are now in the Louvre, would have sufficed for his fame. They could not make Chardin's fortune.

His domestic scenes—the quite different work which succeeded his *nature morte*—were multiplied and reproduced at once by the engravers of the day. Issued very often at a couple of francs apiece, they hung by the dozen on *bourgeois* walls, reflecting the life led in the chambers they ornamented. These works, the originals of the prints now again popular in France, are in some respects of his best period, and more must be said of them before we close. A third order succeeded them. Chardin had long enjoyed notice, and was fearful of the time when notice should be withdrawn for lack of novelty. That motive, and the success of Quentin de la Tour, now his neighbour in the galleries of the Louvre—Quentin de la Tour, who has enriched the museum of his native town so that it is worthy of a pilgrimage—led him to the execution of pastel-portraits. But his day was past. Enemies multiplied. Critics became indifferent. And the old man, long a martyr to the disease which caused a noted Englishman to declare that the greatest pleasure in life was the cessation of pain, lingered uselessly and sad. Dropsy followed, in the last days, upon stone. On December 6, 1779, a friend wrote of him that he was so feeble that he had now taken the sacrament. "*M. Chardin a reçu le bon Dieu.*" He died before the close of the day, and was buried at S. Germain-l'Auxerrois.

Interest centres, for most men nowadays, in the second class of his works, and it is these exclusively that have been engraved. Chardin, for most men, is the painter of *Le Bénédicité*, of *La Mère Laborieuse*, of *L'Econome*, of *La Gouvernante*. He is the painter, that is, of decent middle-class life, in its struggle with narrow means, and in its happiness, which is that of the family and of tranquil work. Allied to certain of the Dutchmen, though hardly indeed to be confused with them, he resembles them in his faithful portrayal of the things that he saw, whether these were only the heaped-up contents of the fish-stall, and the fruits massed for dessert, and glasses from the cupboard and a silver goblet, chased richly, or child and mother saying grace before the meal in a narrow room, curiously ordered (*Le Bénédicité*), and the housewife reckoning with contented gravity her morning's outlay in marketing (*L'Econome*), and the white-capped care-taker, gentle and young, bending forward with a warning to the boy who is her charge (*La Gouvernante*). But in the painting of what he saw, there was, of course, choice always, and his choice was other than the Dutchmen's—other, at least, than that of Teniers, Browver, Ostade, Dusart; those to whom for certain qualities he has distantly been likened. So that between his work and theirs there comes to be a great wide difference—the gulf that separates vulgarity from simplicity, lowness from homeliness—besides that other difference which needs must be when the one group of painters is concerned with the round-faced phlegmatic type that lives its slow life among the canals of

Holland, and the other painter with the type of happy vivacity and quiet alertness and virginal or motherly grace which is that of the true middle-class of France. This latter difference there must always be, even if we take the work of Chardin and set it, as indeed we have a right to do, against that of another order of Dutchmen, whose sentiment is nearer it—De Hooghe, Nicholas Maes, and Van der Meer, of Delft, who like Chardin took representative moments of common occupations, and in recording them recorded a life. The finer spirit will still be Chardin's, and in looking over the suite of his engravings, or passing in review even the titles only of his pictures, it will be proved that these figures which he painted he painted more with a single mind to the lives which the habitual occupations were destined to reveal. No doubt the greater Dutchmen thought of that, but in their unrivalled triumph of lights and shades, and tints and textures, they thought of it—even the best of them—less than Chardin.

And it is very noteworthy that Chardin, when he passed from still life to domestic scenes, became, so to say, a second and quite another artist. He accepted frankly the new vocation, and the marble of the mantelpiece, the red tiles of the floor, the metal of the parlour clock, were thenceforth wholly accessories. With fair if not faultless design, with pleasant sobriety of tone, with keen observation and happy and genuine sentiment, he concentrated himself upon those scenes of the humble interior, whose quietness and diligence and homely grace and charm no one has better felt or rendered. And from the one class of picture you have no cause whatever to suspect him to be also the painter of the other.

FREDERICK WEDMORE.

THE ART CONGRESS AT LIVERPOOL.

THE Art Congress at Liverpool, which is to take place from October 11 to 18, may, if successful, be productive of much good. It is necessary to create a demand for healthy and pure art just as much as to create a supply, and a Congress which popularises the true principles of art will do a work that is much wanted. The world is in search of beauty, and willing enough to be led where beauty is to be found; but it has so often given its faith to false prophets that it has begun to be sceptical of any opinions until it has heard what is to be said against as well as for them. This is precisely what a meeting of this kind does. The debates arouse an interest which no mere reading can excite, and the professors are subjected to a cross-examination which causes the same difference to exist between oral description and art literature as between written and *viva voce* evidence. Take the first question to be debated, namely, the best method of improving street architecture, which is to be opened by Mr. J. J. Stevenson. There is no doubt that the disastrous mistakes which render our streets hideous are the results of ignorance and not of wilful bad taste, and that, though the diffusion of sound taste may be a work of time, still it will be much aided by meetings like the present, which raise excitement on, and call attention to, the subject, and rouse an interest which does not altogether subside, but, like the overflow of the Nile, leaves a residue of solid good behind. On other grounds it is desirable that the influence of Academies should be debated at a distance from London, and in a town where somewhat of the lay element may be introduced. In the hands of Mr. Watkiss Lloyd

it will be dealt with in such a spirit that the discussion will be protracted and thorough. The question of mural decorations, which Mr. W. B. Richmond has undertaken, assisted by Mr. W. Cave Thomas, is one upon which depends much of the future greatness of the English school. Raphael and Michel Angelo could not have been the painters they were had they been confined to easel pictures all their lives; and it is only by the encouragement of Municipal Governments that the opportunities can be afforded to the painters of our own country which were enjoyed by the great artists of the Renaissance. The artistic possibilities of furniture constitute, if a humble, an important question; by no one can it be more ably argued than by Mr. Eastlake. Art in the household is a form of civilisation which comes home to the humblest roof, as was proved by Josiah Wedgwood in the last century, and by many a piece of ancient carved work which is fished out of old Lancashire or Yorkshire cottages. Anything that turns the current of excitement of a great town into an enthusiasm for beauty represses and turns into healthy channels that unhealthy craving for sensual luxury which is the great danger of a wealthy civilisation.

P. H. RATHBONE.

CHRISTIAN ANTIQUITIES IN ROME.

Rome: Sept. 20, 1876.

Comparatively little has been done in the Roman "Catacombs" during the last few years, and it is gratifying to know of the recent re-opening of one of those primitive Christian cemeteries, which was first (in modern times) explored by the illustrious Bosio, 1594 (v. his *Roma Sotterranea*), and again, when many legible epitaphs, urns, skeletons, and some paintings were discovered there, in 1693. This hypogeum extends along the right of the Flaminian Way, beginning at the distance of about a mile from the Porta del Popolo. It was dedicated to S. Valentine, a martyr above whose sepulchre, therein contained, a stately basilica was raised by Pope Julius I., A.D. 337, and restored during the seventh, eighth, and ninth centuries by five successive Pontiffs. Both this basilica and a once important monastery adjoined to it totally disappeared in the course of ages; and but a few slight ruins of the church and the Abbey (as such the cloister ranked) were recognisable when Bosio carried out his explorations on the spot. The most memorable discovery by that explorer in these "Catacombs of San Valentino" was a much-damaged picture of the Crucifixion, the sole representation hitherto known to us of that sacred subject among the pictorial art-works in the subterranean cemeteries near Rome. It is, however, as Bosio shows, a picture not of the earlier Roman, but of the Byzantine School, therefore failing to attest any exception to the rule for avoidance of the more awful and tragic scenes in the illustrations of the Divine Sufferer's life desired, or sanctioned, by the primitive Church. A private enterprise for exploring in this long-closed cemetery of St. Valentine, undertaken by one Signor Orazio Marucchi, has, I am glad to report, resulted in the re-discovery of the same Crucifixion picture, together with certain others (scenes from the life of the Blessed Virgin and figures of saints) there found, and for the first time described, by Bosio. That Crucifixion was recently brought again to light, after the removal of a heap of ruins belonging to some mediæval (or more modern) structure, and it is perhaps owing to this concealment that the colouring of the picture appears still better preserved than might have been expected.

So much was the now, in Rome and Italy alike, almost forgotten St. Valentine once revered in the Metropolis of the Papacy that the Flaminian gate was named after him, as "Porta San Valentino," long before it received its actual designation as "del Popolo."

Another valuable acquisition in the range of Christian art in this city has been secured in the course of works for renewing the high-altar of the beautiful old church, S. Pietro in Vincoli, where the first stone of a new and splendid *ara* was recently laid by the Cardinal Ledochowski. Under the pavement, between the ancient altar and the apse, was found a sarcophagus of white marble more than two mètres in length, adorned with *relievi* of highly-finished style, entitled to class among the best works in such sacred art as the fourth (or fifth) century could produce—these sculptures not being referable to a date earlier than the former of those two epochs. The subjects are within the range of those most familiarly seen on Christian sarcophagi of corresponding dates: the Raising of Lazarus; the Miraculous Multiplication of Loaves and Fishes; the Saviour admonishing St. Peter for his triple negation of his Divine Master; and also (much less commonly introduced in such association) the group of Christ with the Samaritan woman beside the well, and the bestowal of the symbolic keys on St. Peter—the last pertaining to the relatively modern class of Christian subjects in sculpture at Rome. This sarcophagus has the peculiarity of being divided interiorly into seven compartments. Ecclesiastical authorities have caused it to be closed with their official seals; but we may expect that it will eventually find place in the Christian Museum of the Lateran—or in that entered from the Vatican Library.

C. I. HEMANS.

NOTES AND NEWS.

A NEW lecture-room and School of Art have been opened this week at Leicester. A loan exhibition of modern paintings, including works by Wilkie, David Cox, Nicol, Cooper, Gilbert, and other well-known artists, had been arranged to do honour to the opening ceremony.

AN excellent plaster cast of a highly-decorated Gothic tabernacle from the church of St. Leau, near Brussels, has just been added to the numerous reproductions of the same kind in the new South-East Court of the South Kensington Museum. The tabernacle somewhat resembles in height, form, and workmanship the celebrated Adam Kraft Shrine in the Frauenkirche at Nürnberg, but it has not the same grace of line as that wonderful work, nor is it so delicately carved. It strikes one in fact as being heavy in comparison with the Nürnberg pinnacle, but in other respects it is certainly a very rich specimen of Flemish sculpture in the sixteenth century. It is attributed on the label to one Rombaut de Dryvere, of Malines, but this is all the information that is given about it, nor could we learn anything of its history except that the cast had been gained in exchange for others from the Belgian authorities. The elaborate ornamentation, consisting of baskets of fruit, flowers, heads, and other carvings, is chiefly of the Renaissance type, but the numerous subjects sculptured in high relief have a more distinctly Gothic character. These subjects are taken from the history of our first parents, and represent the creation of Eve, Adam receiving the apple from Eve, the Almighty appearing to Adam and Eve in the garden of Eden, and various other scenes in the Genesis narrative. Also there appears to be a series representing sacrificial ceremonies, and higher up a representation of the Passion of our Lord. The tabernacle reaches, so far as we could judge, to a height of between fifty and sixty feet, but it is quite straight, and does not curl over at the top after the graceful style of the Nürnberg example.

THE Société des Amis des Arts à Versailles have just opened their twenty-third annual exhibition. It is held, as last year, in one of the *salles* of the Lyceum, and not as heretofore in the celebrated but inconvenient *salle* of the Jeu-

de-Paume. The number of contributions is not large, nor are there any that claim particular notice. Landscapes, flowers, and representations of still life seem to predominate.

THE Naples Fine Arts Exhibition, which was to have taken place this year, but was postponed from various causes, is now definitely announced for April 2, 1877. It will include works in painting, sculpture, architecture, engraving of every kind, and polychromatic decoration; also designs of all sorts for woven materials, and other fabrics. The works of artists who have died within the last ten years will be eligible for exhibition. Consignments from foreign nations will be received from January 1 to 31, 1877, and further information given by the Secretary of the Fine Arts Committee, Naples.

THE *Journal Officiel* has recently published the general regulations for the organisation of the French Exhibition of 1878. The Exhibition is to be opened on May 1, 1878, and to close on October 31 following. It is organised under the direction of the Minister of Agriculture and Commerce, but a chief commissioner, M. le Sénateur Krantz, has been appointed by a Presidential decree for its general direction. He will be aided in each department by special commissioners, whose work it will be to make known the conditions of exhibition, decide upon claims for admission, and in every way contribute to the fulfilment of the aim of the exhibition by stimulating the endeavours, and showing forth the resources of their particular departments. Similar commissions will likewise be formed in foreign countries, and foreign exhibitors are requested in all cases to communicate with their national commission, and not with the French director. Each nation is required to divide its products into nine different groups, which form the basis of a general system of classification. These groups are arranged in the following order:—1. Works of art; 2. Education, instruction, materials and processes of the liberal arts; 3. Furniture and accessories; 4. Tissues, clothing and accessories; 5. Extractive industries and wrought products; 6. Implements and processes of mechanic industry; 7. Alimentary products; 8. Agriculture and pisciculture; 9. Horticulture. These nine groups are further subdivided into ninety different classes. No work of art or other article exhibited is allowed to be sketched, copied, or reproduced in any fashion, without the consent of the exhibitor, and no work can be withdrawn before the close of the exhibition without the authority of the Commissioner-General. Each nation will have the right of having a catalogue printed of its own particular section, but this must be at its own cost and only in its own language. A general catalogue will be prepared for the guidance of the public, which will indicate the position of the articles exhibited and the names of the exhibitors. Exhibitors will have nothing to pay for the place allotted to them, but if they require extra security, or more decoration, they may undertake it at their own cost, subject to the permission of the Commissioner-General. The exhibition will be held in the Champ de Mars and on the heights of the Trocadéro.

THE Düsseldorf painter, Peter Janssen, has just finished the decoration of the second Cornelius-Saal in the new National Gallery of Berlin. On each side of the walls of the niche in which stands the colossal bust of Cornelius, he has painted two large compositions intended as allegories of the *Iliad* and the *Odyssey*, with all the principal gods and goddesses of the Homeric heaven swaying in the ether above. The figures of Pallas Athene and of Odysseus, who sits in deep thought with his head resting on his hand, are highly praised by the Berlin *Tageblatt*; indeed, the whole work seems to have called forth considerable admiration from German critics, while most of the other decorative paintings of the new gallery have, on the other hand, been severely abused.

THE *Bullettino dell' Instituto di Corriap. Arch.* (August and September) continues its account of excavations at Pompeii, Corneto (Tarquinii), and Capua. From Pompeii and Corneto there is little of interest to report; nor from Capua is there much that is strictly novel, but there is a new and interesting summary of the results obtained from the excavations since 1845 in the necropolis beside S. Maria with its sanctuary or temple in some way connected with the rites of the dead. What deity may have presided in this temple is at present unexplained, but it seems certain that the marble statue of a female figure holding an infant in her arms, said to have been found in the ruins, represents that deity, whoever she may have been. The same figure occurs in numerous *votivi* of tufo here and there in the cemetery, but in most cases she is seated instead of standing as in the marble, which probably was the principal image of the goddess. According to the writer of the notice (F. von Duhn) this must be the goddess who receives in her kindly arms the souls of the departed, here represented as infants or boys. Souls, there is no doubt, were represented as diminutive figures, but there is a considerable step between diminutive figures of souls such as appear on the Harpy monument from Xanthos, or on the marble sarcophagus also in the British Museum, and the natural figure of an infant. It is necessary to overcome this difficulty before Herr von Duhn's explanation can be accepted, because this explanation, though probable enough under the circumstances of the find at Capua, necessarily applies also, as he points out, to the existing terra-cottas representing a female figure seated with an infant in her lap, which figures have been on conjecture called Gaea Kouritrophos. In the same cemetery was found a number of terra-cotta *stelae*, with Oscan inscriptions, and ornamented with a figure of a pig in relief. If, as is probable, these *stelae* had been dedicated to the goddess of the cemetery, then it would be right to compare her with Demeter, to whom, as goddess of the lower world, a pig was the proper sacrifice, and to whom figures of pigs were dedicated. Of the figures of the goddess with the child part are described as of local workmanship, while others are obviously Greek and may be supposed to have been imported.

It has often been surmised that Hans Holbein, beside his celebrated work in wood-engraving, executed a *Dance of Death* in painting at Basel, or, as some imagine, in the palace of Whitehall in London. But, in spite of the strict investigation to which his life has recently been subjected, no certain indication of such a work has yet been arrived at. A German professor, Herr Vögelin, however, as the latest contribution to Holbein literature, has now brought forward various arguments to prove that a series of dilapidated wall-paintings still existing in the old Bishop's palace at Chur in Switzerland, representing the *Dance of Death* of Holbein, was actually painted by the master himself, and that we have in these paintings the originals, and not the copies of the woodcuts. So bold a theory needs strong reasons to support it. The *Dance of Death* at Chur, though not well known, is mentioned in most guides to Switzerland. Burckhardt says of it: "It repeats in larger size the world-famous little woodcuts of Hans Holbein, and in so excellent a manner that at first sight one scarcely misses the original touch of the master, although it is improbable that this work was really executed by him." It has, in fact, always been supposed to have been done by some later, but unknown, artist, who cleverly copied and enlarged the woodcuts. Prof. Vögelin, however, finds several grounds for discrediting this supposition. He first published his views last April in a Swiss journal called the *Freie Rhätier*, but the *Kunstchronik* has recently given them wider publicity. It is stated also that the Antiquarian Society of Zürich are preparing a comprehensive work upon the wall-paintings at Chur which will consider in full the

question of their origin, and will likewise give satisfactory reproductions of them. Prof. Vögelin's theory respecting them, as stated under eighteen heads in the *Kunstchronik*, is that Holbein executed these works as he passed through Switzerland on his way home after his Italian travels, and that he afterwards took the cartoons with him to Basel, where he conceived the idea, probably from the suggestion of some bookseller, of multiplying them by means of wood-engraving. With this view he somewhat heightened their satirical import, and made other slight changes (the paintings and the woodcuts are not always identical), but, as far as regards their reduction and execution, he left the work very much to the wood-engravers, and before the blocks were completed journeyed to England. Soon after this the Formschneider, who was probably Hans Lützenberger, died, and his effects were sold to the publishers Melchior and Gaspar Treschel, who finished the work, and finally brought it out at Lyons. The arguments that Prof. Vögelin brings forward in support of this view are too long to enter upon here; some certainly appear trivial, but others, it must be admitted, are of sufficient weight to demand attention, and, at all events, leave the subject open for discussion.

THERE has recently been added to the many delightful works by Bernardino Luini in the Brera at Milan a series of frescoes and fragmentary decorations taken from an ancient chapel dedicated to St. Joseph in a disused church situated in the outskirts of Milan. This church was suppressed in the seventeenth century, and the frescoes in it were allowed to fall into decay. In 1805, however, a certain number of them were restored and removed to the Brera by the celebrated Andrea Appiani, but others remained that he was afraid to touch on account of their dilapidated condition. These have now, by the aid of modern appliances, been safely transported and placed with their predecessors in the Milan gallery. Unfortunately even now the two sets remain somewhat apart, as those gained in 1805 are still hung in the galleries of the first-floor, while those recently acquired find a resting-place on the ground-floor. It is to be hoped, however, that ultimately the whole of these frescoes, which form part of one grand series illustrating the history of St. Joseph, will be exhibited together, and the different scenes placed in their proper order. An interesting pamphlet on these frescoes, entitled *La Cappella di San Giuseppe alla Pace e gli ultimi suoi aranci*, has just been published at Milan, by Signor Mongeri, the author of *Arte in Milano*. He considers that there is little room to doubt that the chapel of San Giuseppe was really decorated by Luini, although the history of its foundation, and even the name of its founder, are now lost. The paintings now removed are chiefly those which adorned the cupola of the little chapel, and, although they are fearfully ruined in parts, they still, according to Signor Mongeri, fully reveal the charming style of the pupil who was imbued more than any other with the gracious spirit of his great master, Leonardo da Vinci. As regards date, he places them between those which Luini executed in 1521 for the church of the Umiliati, and those of the Villa Pelluca, several of which are now in the Brera.

THE STAGE.

"RICHARD THE THIRD" AT DRURY LANE.

MR. CHATTERTON has so recently published his reasons for lack of faith in the attractive qualities of Shakspeare's plays upon the stage that it is natural enough that the revival of *Richard the Third* at Drury Lane should be accompanied by a public explanation of his apparent change of policy. From the manager's point of view it must be confessed that the reasons given last year for preferring playwrights to poets were unan-

swerable. When *King John*, *Macbeth*, and *As You Like It* fail, even with the assistance of Mr. Phelps and Miss Helen Faucit, to yield a remunerative return, while, on the contrary, Mr. Boucicault's *Formosa* and Mr. Halliday's adaptations of the Waverley novels are found to produce a handsome profit, it would be cruel indeed to blame Mr. Chatterton for shaping his policy in accordance with the tastes of his customers. Shakspeare, however, has again taken his place in the Drury Lane playbills, and the reason given by the management is "the strong indications which have lately presented themselves on the part of the play-going public of a revived interest in the stage production of Shakspeare's plays." It is painful, of course, to reflect that the first discovery of this improved demand for dramatic wares has been made, not by a theatre with a great historical name, but by the managers of those humbler establishments which never had any patent to shield them from the arbitrary power of a Lord Chamberlain, and which, little more than thirty years ago, were even forbidden to perform the higher drama under awful pains and penalties. Still there is consolation in the thought that, although the tastes of playgoers are thus fickle, the public do, after all, appear to attach some importance to the question what words shall be spoken by way of accompaniment to the picturesque scenery, the splendid pageants, and the great mechanical effects which occupy so large a space in playbills and public advertisements. They may to-day prefer *Formosa* and *The Great City* to *King John* and *Macbeth*; while to-morrow there may be "indications" strong enough to induce a prudent manager to place Mr. Boucicault and Mr. Halliday on the shelf again. Those, however, who contend that scenery and "stage carpentry" are nowadays the sole end and object of performances in our larger theatres will, at least, have to explain the influences which have so operated in the breast of Mr. Chatterton as to bring about this sudden revolution in his notions as a practical manager who makes no pretence of conducting his theatre with any other view than that of paying his performers and securing a reasonable return for his labour and outlay.

Altogether Mr. Chatterton's position, under the circumstances, seems so sound that one may feel a natural reluctance to find any fault with his proceedings. But the dramatic reviewer, unfortunately, cannot always look at things from the point of view of the manager. In the discharge of his duty he is occasionally compelled even to condemn performances that "pay;" and it must be said that the revival of *Richard III.* at Drury Lane is open to grave objections. It might have been expected that the strong indications of a revived interest in Shakspeare would have encouraged the management to produce the play in something approaching the form in which it appears in every edition of Shakspeare's works. They have chosen however to adhere to the acting version prepared by Colley Cibber, wherein the poet's scenes are mercilessly maimed and disfigured, even the interpolations which are derived from other plays of Shakspeare being as a rule inserted without taste or judgment, while the additions from the pen of Cibber himself and other writers, and the wholesale suppression of scenes necessary to the harmony and effect of the play, are altogether unjustifiable. It is true, as the management point out, that this version, which has held the stage for nearly two centuries, has been stamped with the authority of many distinguished actors. The mention of Mr. Macready's name among these is certainly calculated to mislead: the fact is that with the exception of Mr. Phelps, who performed this play at Sadler's Wells with his accustomed reverence for the text, the only approach to the restoration of Shakspeare's play which has probably been made on our stage since the closing of the theatres in 1642 was essayed by Mr. Macready in 1821 at Covent Garden. This (as the playbill expressed it) was "an attempt to

restore the original characters and language of Shakspeare," retaining "no more extraneous matter than the trifling passages necessary to connect those scenes between which omissions have necessarily been made for the purposes of representation." Mr. Macready's own account of the matter is sufficiently interesting to be worth quoting from his *Reminiscences* :—

"An alteration (he says) of Cibber's adaptation of *King Richard the Third* had been sent to me by Mr. Swift, of the Crown Jewel Office, but varying so little from the work it professed to reform that I was obliged to extend the restoration of Shakspeare's text, and it was submitted (March 12, 1821) to the public ordeal. The experiment was partially successful—only partially. To receive full justice, Shakspeare's *Life and Death of King Richard III.* should be given in its perfect integrity, whereby alone scope could be afforded to the active play of Richard's versatility and unscrupulous persistency. But at the time of which I write our audiences were accustomed to the coarse jests and *ad captandum* speeches of Cibber, and would have condemned the omission of such uncharacteristic claptrap as :

'Off with his head! So much for Buckingham!'

or such bombast as :

'Hence, babbling dreams: you threaten here in vain; Conscience, avaunt! Richard's himself again!'

In deference to the taste of the times these passages, as well as similar ones, were retained. At a later period, if the management of Covent Garden in 1837-9 had been continued, the play with many others would have been presented in its original purity."

In the face of this evidence, it is at least a mistake to cite Mr. Macready among the eminent actors who have preferred Cibber's version; nor is there any certainty that the other distinguished representatives of Richard whom Mr. Chatterton mentions shared the corrupted tastes of the playgoers of their time. The truth, however, is that Cibber's play allowed the crook-backed tyrant to keep himself more constantly in the eye of the spectator, while removing as far as possible opportunities afforded to the representatives of other personages of displaying their powers. It may be suspected that this reason alone has had much to do with the long withholding of the original play from the stage. Any way it is important to observe that the two most distinguished actors of modern times—Mr. Macready and Mr. Phelps—have distinctly notified their faith, as practical managers, in the acting qualities of Shakspeare's play. It is fair to say that the Drury Lane management, though substantially they adopt Cibber's version, do not follow it to the line. How far that rash adapter was qualified to improve the text may be inferred from the intolerable bathos of the following scene, with which he thought fit to conclude the play :—

"BOSWORTH FIELD.

Enter KING RICHARD meeting RICHMOND.

King R. Of one or both of us, the time is come.

Richm. Kind Heaven, I thank thee, for my cause is thine.

King R. If Richard's fit to live let Richmond fall.

Thy gallant bearing, Harry, I could 'plaud But that the spotted rebel stains the soldier.

Richm. Nor should thy prowess, Richard, want my praise

But that thy cruel deeds have stamped thee tyrant;

So thrive my sword as Heaven's high vengeance draws it.

King R. My soul and body on the action both!

Richm. A dreadful lay; here's to decide it.

[*Alarums. They fight. Richard falls.*"]

On the whole it must be confessed that congratulations upon those indications of a revived taste for Shakspeare to which Mr. Chatterton refers would be premature until we know what it is that the public really demand.

The scenery, which has been painted for the occasion by Mr. Beverley, follows closely the scenic programme of Mr. Charles Kean's magnificent revival at the Princess's Theatre in 1854; the costumes are also governed by the same

precedent. It is difficult to imagine that more could be done for the success of the revival in the way of accessories, which have the merit of being strictly illustrative as distinguished from mere magnificence. Of the acting it is not necessary to say much. Mr. Barry Sullivan, who represents the Duke of Gloucester not for the first time at this theatre, allows himself to be described in official announcements as—

"one of the few actors remaining to whom Shakspeare has been a life-long study, and who, starting from a point when much of the old traditions still survived, has not remained a petrified embodiment of bygone conventionalities; but, while retaining the animated spirit and well-trained method which guided the former masters of the actor's art to such great results, has modified their interpretations according to the dictates of an independent judgment and the requirements of modern ideas, feelings, and artistic tendencies."

This glowing account of Mr. Sullivan's merits, however, requires some qualifications. He certainly performs the character of Richard in a subdued key, to which his predecessors in the past were not accustomed; but this is probably imperative on an actor who, contrary to the old system, undertakes to sustain so arduous a part night after night. In other respects his impersonation is distinctly of the old school, the tokens of which are a solemn deep-voiced style of elocution, and a tendency to exaggerate the hypocritical side of the character to the neglect of subtler attributes. Mrs. Hermann Vezin moved the audience greatly by her pathetic tones and just delivery of lines in the part of Elizabeth. The remainder of the performers are, with scarcely an exception, incapable of delivering verse, either with attention to rhythm, or with that correctness of emphasis which carries an impression of sincerity to the mind of the audience.

MOR THOMAS.

M. ALEXANDRE DUMAS has at last made up his mind to publish *L'Etranger*. He has thus far adopted the unusual course of reserving it from publication; not so much, it is probable, out of any apprehension that the existence of the work in print could in any way interfere with its attractiveness as a stage play at the Français, as from the knowledge that the piece owed from the beginning so very much to the actors that the author's repute could hardly be increased by its publication. In England Mr. T. W. Robertson was similarly wise. But now the great stage-success of the past season in Paris is about to be given to the public in its literary form, which, rumour says, M. Dumas has been continually working upon.

Rome Vaincue, the last promised piece at the Théâtre Français, was to be produced on Thursday evening in this week.

Mlle. SARAH BERNHARDT's exertions in *Phédre*, the performance of which was written about in the last number of the ACADEMY, have tended to limit her appearances before the public since then.

Mme. FARGUEIL objects to play in a new piece at the Porte St.-Martin, it is said, unless certain changes in the cast are made to her liking.

MUSIC.

ADAM'S "GIRALDA" AT THE LYCEUM.

By the production, for the first time in England, of Adolphe Adam's *Giralda* on Thursday week last, Mr. Carl Rosa has added to our repertoire of English opera a work which is likely, for more reasons than one, to become a general favourite. Adam is in his style essentially a popular composer. Of his fifty-three dramatic works there is perhaps hardly one which in the strict sense of the term deserves to be called great: he has little or no depth, and his music does not go to the heart; but it is pre-eminently pleasing. The composer had an inexhaustible fund of

melody, much elegant fancy, an excellent sense of dramatic appropriateness, and, what is perhaps even rarer in music, genuine comic power. The prevailing impression left after hearing one of his operas is that we have been greatly amused. Of decided originality of style there is but little. I do not mean to imply that actual reminiscences are to be met with in the music; but there were many passages in *Giralda* which, had I heard them without knowing whence they came, I should have unhesitatingly ascribed to Auber.

Giralda is one of its composer's later works. It was produced for the first time in Paris at the Opéra Comique on July 20, 1850, about six years before the composer's death. The libretto is one of the best of Scribe's comedies of intrigue, being not unworthy in this respect to rank with such pieces as the *Domino Noir* or *La Part du Diable*. It has, I believe, been adapted as a comedy on the English stage; but of this I cannot speak from personal knowledge. An outline of the plot will be worth giving, not only on account of its ingenuity, but as showing the kind of subject which most exactly suited the genius of Adolphe Adam.

The first act takes place in a little village in Galicia. Ginès Perès, a young miller, is about to be married to Giralda, the adopted daughter of a farmer, and has received with her a dowry of three hundred crowns. The young lady tries to induce him to give up the marriage, by informing him that she loves another; but he, though he cares nothing for her, cares much for the crowns, and refuses to release her. She has only met her lover in the dark, and has never seen his features. Don Japhet d'Atocha, a gentleman in attendance on the Queen of Spain, comes forward, and makes requisition of the farm for the King and Queen, who will pass through the village and stop there with their suite for the night. While he is making his arrangements, a young cavalier, Don Manuel, enters. This is Giralda's unknown lover, who, surprised at her absence, has come to look after her. Don Japhet and he recognise one another, and the former tells the latter that he is secretly married. Don Japhet having entered the farm to make preparations for the royal party, Ginès enters, disconsolate at having the farm taken away on his wedding day. In a conversation with Don Manuel, the latter discovers that the bride is to be Giralda, and that her future husband does not care for her. He offers him six hundred crowns to take his place at the altar, an offer which Ginès gladly accepts. As the wedding takes place at night, the substitution is not discovered; but on the return of the wedding party, the King and Queen have arrived, and Don Manuel, for fear of recognition, takes to flight. The King, who appears to be far too fond of the fair sex, is smitten with the charms of the bride, and asks for the husband. He, however, has disappeared. The villagers call for Ginès, of course supposing him to be the happy man, and Ginès enters from the farm, and is ordered by the Queen at once to take his bride up to his mill. He does so, with considerable disquietude, wondering "what the other will say."

The second act takes place in the mill. Ginès and Giralda enter, and while the latter withdraws with her bridesmaids, Don Manuel, who has also found his way to the mill, comes forward to claim from Ginès the fulfilment of his bargain. The young miller yields his place to Don Manuel, and withdraws to wait for further orders. The King and Don Japhet enter by the window; Don Japhet is placed outside as a sentinel, Don Manuel meantime having hidden himself on the appearance of the monarch. To render clear the most ingenious and comical scenes which follow, it would be needful to quote nearly the whole dialogue: the incidents are so cleverly dovetailed into one another that an epitome is impossible; it must suffice to say that at the end of the act Giralda believes herself to be the wife of Don Japhet. In the third act everything is, of course, cleared up and all ends satisfactorily.

Though I should hardly be inclined to endorse the opinion of M. Clément that *Giralda* is from a musical point of view the best of its composer's works—I should be inclined to give the preference to the *Postillon de Longjumeau*—the score contains much really charming music. The overture is one of the most sparkling and piquant specimens of the French school, and worthy to compare with the best of Auber's. It is in the more comic situations that Adam shows the greatest strength; the duet in the first act between Ginès and Giralda, and that between Ginès and Don Manuel, and the exceedingly humorous quintet in the third act are in the composer's best vein. In the more serious parts of the music are to be found much grace, but less individuality. Among the best of such numbers are Manuel's song, "Oh dream of love," the air of the King, "While youth gaily smiling," and the couplets for the Queen, "The Queen am I, and by etiquette bound."

In speaking of the performance one can but repeat the thrice-told tale, and say again what has to be said of every work given under Mr. Rosa's direction. There was the same excellent *ensemble*, the same admirable finish "all round," that has been so noteworthy a feature in all previous productions. The part of Giralda was sung by Mlle. Ida Corani, whose brilliant, if not absolutely perfect, vocalisation again elicited warm applause. Dramatically her performance showed an advance upon her Amina; and there seems every reason to believe that as she gains more experience on the stage she will prove a valuable acquisition to Mr. Rosa's company. Miss Josephine Yorke as the Queen, and Mr. Celli as the King, were both excellent, the gentleman especially not only singing but looking and acting his part to perfection. As the young miller Ginès, Mr. Charles Lyall was exactly suited, his impersonation being a highly-finished piece of art. Mr. Henry Nordblom was a most efficient Don Manuel, and Mr. Aynsley Cook, as Don Japhet, kept the audience in a roar of laughter whenever he was on the stage. Both chorus and orchestra left nothing to desire.

The production of Wagner's *Flying Dutchman* has been postponed till next week. According to present arrangements, it is intended to produce it on Tuesday.

EBENEZER PROUT.

THE Report for the year 1875 on the Examination in Music of the Students of Training Colleges in Great Britain, by Mr. John Hullah, the Inspector of Music, which has recently been issued, is a document of a highly satisfactory and encouraging character. Mr. Hullah says that the general improvement in musical progress during the year is even greater than he had anticipated. This improvement is attributable to a variety of causes, foremost among them being the official recognition of music as an important branch of education. The inspector found also that a somewhat larger proportion of the new students than heretofore had some acquaintance with the elements of music before entering college. In this matter, nevertheless, there is still room for considerable amendment, and Mr. Hullah wisely points out that the only way to secure this is to train the future student while at school, and before he even becomes a pupil-teacher. In the power of singing at sight, the most important test of thorough musical knowledge, "unprecedented improvement" is reported. It is curious and interesting to learn that in what is known as "a correct ear" the Welsh are the most musically apt, and the Scotch Highlanders the least. "I have never," says Mr. Hullah, "met with a Welsh student with what is called a defective ear." In instrumental music considerable progress appears to have been made; and the report as a whole is one which affords every cause for congratulation.

WE regret to announce the death, at Paris, on the 17th inst., of Ernst Lübeck, the celebrated pianist, at the age of forty-seven. He was a native of Holland, his father being a distinguished

violinist and director of the Conservatory at the Hague. The son studied music under his father, and early commenced his career as a public performer in his own country. At the age of twenty he visited America, where he remained for four years, giving concerts with great success. On his return he settled in Paris, where, though often heard in public, he devoted himself principally to teaching. He first visited London, if we are not mistaken, about 1860, and was heard at the concerts of the Philharmonic Societies, the Monday Popular Concerts, and the Musical Union. About the close of the year 1873, he lost his reason, and was for a short time an inmate of an asylum; but he subsequently was sufficiently restored to be able to return to his own home. His constitution, however, was broken up, and he suffered during his last years from an incurable malady. As a pianist, Lübeck possessed an enormous execution, and a fine touch; our impression of his playing, however, speaking after a lapse of some years, is that it was calculated to excite admiration rather than sympathy.

THE *Neue Zeitschrift für Musik* states that Frau Materna has received a letter from Wagner, addressing her as the "Treueste unter den Treuen," and once more thanking her for her devotion to his cause, and for her performance as Brünnhilde. It is added that numerous engagements have been offered to Frau Materna, from Italy, England, and Russia, especially for performances of Wagner's operas.

FRANZ WEBER, the conductor of the celebrated Cologne Choir ("Cölner Männergesangsverein"), died in that city on the 18th inst. at the age of seventy-one.

THE *Neue Freie Presse* states, on the authority of a private letter from Bayreuth, that on August 21 an explosion of gas took place in the Wagner Theatre, whereby three workmen were dangerously injured. Had the accident happened only twenty-four hours earlier the results would have been most disastrous, as some of the first rows of seats were torn up and partially destroyed.

SOMETHING ABOUT THE ORIGIN OF SPACE. CANTONIA'S CABINET, besides being a satire on Lord Beaconsfield's Government, contains something about the Origin of Space. The *Bolton Guardian* says:—"We know nothing so rich." Price One Shilling. F. M. V. & Co., 36 Henrietta Street, London, W.C.

ASHER & CO.'S PUBLICATIONS.

13 BEDFORD STREET, COVENT GARDEN, LONDON, W.C.

BOLTZ (Dr. A.)—A NEW CONVERSATION GRAMMAR of the GERMAN LANGUAGE. Adapted to the Use of Schools and Private Instruction, after the Practical and Theoretical Method of Robertson, 8vo, cloth, 5s.

"This is by far the most interesting work on the German language that we have met with for a long time."—*Public Opinion*.

BUXTORFII (JOHANNIS).—LEXICON CHALDAICUM TALMUDICUM et RABBINICUM. Denno Editio et Annotatis auxit B. FISCHER. 4to, cloth, 3l.

"To the Talmudist it is absolutely necessary; to the Semitic scholar it is of great value. Both will find the new edition not merely a more handy book of reference than its predecessor, but one enriched with considerable additions."—*London Review*.

D'ANVERS (N.)—ELEMENTARY HISTORY of ART. A General Introduction to Ancient and Modern Architecture, Sculpture, Painting, Music. With 150 Illustrations. For Schools and for Self-Instruction. Crown 8vo, cloth extra, 12s. 6d.

"The book commands our unqualified admiration, both as to its arrangement and the amount of research which it evidences."—*Western Mail*.

GESENIUS'S STUDENT'S HEBREW

Grammar, from the Twenty-first German Edition, as revised by E. ROEDIGER, D.D., Professor of Oriental Languages at the University of Berlin. Translated by B. DAVIES, LL.D. With special Additions and Improvements by Dr. ROEDIGER; and with Reading-book and Exercises by the Translator. Second Edition, 8vo, cloth, 7s. 6d.

"We have compared this grammar with some dozen others, and are inclined to place it first of all, for convenience, clearness of arrangement, and general usefulness."—*Second and Third*.

"It is much better to have a good grammar at first—one that is sufficient to supply all needs, such as Roediger's 'Gesenius.'"—*Athenaeum*.

KOEHLER (Dr. F.)—A DICTIONARY of the ENGLISH and GERMAN LANGUAGES. 8vo, half calf, 7s. 6d.

"The best and cheapest German Dictionary now in use."

LENORMANT'S STUDENT'S MANUAL of ORIENTAL HISTORY: a Manual of the Ancient History of the East; comprising the History of the Israelites, Egyptians, Assyrians, Phoenicians and Carthaginians, Babylonians, Medians, Persians and Arabians. By FRANÇOIS LENORMANT. 2 vols. post 8vo, cloth, 12s.

"The best proof of the immense results accomplished in the various departments of philology is to be found in Lenormant's admirable handbook of Ancient History."—*Athenaeum*.

MURRAY (A. S.)—MANUAL of MYTHOLOGY: Greek and Roman, Norse, and Old German, Hindoo and Egyptian Mythology. With 45 Plates on toned paper, representing over 100 Figures. Second Edition, Rewritten and Enlarged. Crown 8vo, cloth extra, 9s.

"It is the best work of the kind in English."—*Athenaeum*.

PLATE (A.)—GERMAN STUDIES. A Complete Course of Instruction in the German Language. Third Edition. 8vo, cloth, 3s.

POITEVIN (P.)—CHOIX de LECTURES.

A Selection of Readings in French Literature of the Nineteenth Century, extracted from the Works of the most remarkable Contemporaneous Poets and Prose Writers. With Biographical and Literary Memoirs. New Edition. 12mo, cloth, 3s. 6d.

"Comprising passages from the works of no less than 140 French writers of the nineteenth century, this collection of 'Elegant Extracts' has been made with due consideration for the peculiar needs of young students."—*Athenaeum*.

SMART (B. C.) and CROFTON (H. T.)—

The DIALECT of the ENGLISH GYPSIES. Containing a Grammar, Copious Vocabularies, Romany-English and English-Romany. With Original Dialogues, Tales, and Translations, illustrating the Manners, Customs, and Dialect of the English Gypsies. 8vo, pp. xxiii-302, cloth, 15s.

"A new and valuable addition to the literature of a subject of daily increasing interest. A very valuable contribution. We recommend philologists not to lose the chance."—*Saturday Review*.

STUDENT'S HEBREW-ENGLISH and ENGLISH-HEBREW LEXICON; chiefly founded on the Works of Gesenius and Fürst, with Improvements from Roediger, Dietrich, Ewald, and others. Edited by BENJAMIN DAVIES, Ph.D., LL.D. New Edition, Improved and considerably Enlarged. 8vo, cloth, 12s.

"No better work can be put in the power of Biblical students."

"It is the best Lexicon for a moderate price which can be procured in the English language. As a philological work, it is of superior excellence."—*Second and Third*.

NEW NOVELS.

CARSTAIRS. By MASSINGBERD HOME, Author of "Shadows Cast Before." 3 vols. [Next week.]

FOOLS of FORTUNE: a Novel. By FREDERICK BOYLE. 3 vols. crown 8vo. [Next week.]

The PRIME MINISTER. By ANTHONY TROLLOPE. In 4 vols. crown 8vo.

BLOTTED OUT. By ANNIE THOMAS. In 3 vols.

CHAPMAN and HALL, 193 Piccadilly.

On Monday next, crown 8vo, with Portrait, price 5s.

LIFE OF MENDELSSOHN

By W. A. LAMPADIUS.

With Supplementary Sketches by

SIR JULIUS BENEDET, HENRY F. CHORLEY, LUDWIG REIL-STAB. BAYARD TAYLOR, R. S. WILLIS, J. S. DWIGHT, and Additional Notes by C. L. GRUNFEN.

Edited and Translated by W. L. GAGE.

Lately published, thick crown 8vo, price 7s. 6d.

HISTORY OF MUSIC,

FROM THE CHRISTIAN ERA TO THE PRESENT TIME.

By F. L. RITTER.

"It would be quite impossible within the limits of this article to touch on a title of the valuable material contained in this volume."—*The Academy*.

WILLIAM REEVES, 185 Fleet Street, London.

SAMUEL BAGSTER & SONS, 15 Paternoster Row.

SATURDAY, OCTOBER 7, 1876.

No. 231, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

BULGARIA.

Geschichte der Bulgaren. Von Constantin Jos. Jireček. (Prag: F. Tempsky, 1876.)

THE appearance of this book is specially opportune at the present time. The German edition appears simultaneously with one in the Bohemian language. The author, apparently admirably qualified for the task, has spared no pains to make his work complete. He remarks in his preface that Bulgaria has only recently become known by the researches of modern travellers, and that he has been obliged to draw his materials from the most diverse languages and the furthest parts of Europe, and that the sources, even when printed, were nearly inaccessible. The preface is dated Christmas, 1875, so that the book owes its origin to a time previous to those events which have made the name of Bulgaria a battle-field for politicians. We believe that the work may be thoroughly trusted, and we recommend it to those readers who would understand something of a question which is every day discussed without sufficient knowledge. We propose to give a very short account of the conclusions arrived at by the author, leaving the criticism of his views to those who have enjoyed something like his own opportunities for forming a judgment.

In the first century of the Christian era a powerful kingdom existed in Dacia. King Decebalus ruled from the Theiss to the Dniester, from the Danube to the recesses of the Carpathians. Although his kingdom was not exclusively Slavonic, it is probable that a large portion of his subjects belonged to that stock. In 107 he was conquered by the Roman Emperor Trajan, a name frequently celebrated in Slav traditions. The Carpi, who gave their name to the Carpathians, and other Slavic tribes gradually making their way into the Balkan peninsula, were settled as colonists by Carns and Diocletian at the end of the third century, and about 500 A.D. moved on to conquer for themselves. We find many traces of Slavs in high positions in Constantinople, especially the two emperors Justin and Justinian—Justinian was called by his own countrymen *Uprauda* (Ὀυ-παύουδα)=*justitia*—so that before the great movement of the barbarians at the end of the fourth century, the Slavs were not unknown to the masters of Byzantium. They were preceded in their advance by the Goths and Huns. Starting from Dacia, the modern Siebenbürgen, they separated into two parts, the Antes and Sloveni, divided by the upper waters of Dniester. They rapidly extended themselves in a southerly direction until Slavonic

was spoken from Arcadia to the Bukowina, from the Platten See to the Propontis. The Pannonian Slavs were conquered by the Avars, but the Byzantine Emperors endeavoured in vain to check the progress of these hordes. Peace was made in 600, but under Phocas and Heraclius Slavs and Avars threatened the capital. By the middle of the seventh century the whole of the Balkan peninsula was occupied by Slavs, Servians and Croatians in the valley of the Save and the coast of the Adriatic, Sloveni in the lands which afterwards bore the Bulgarian name. Greece was entirely occupied by them.

In 679 a new epoch began. The Bulgarians, belonging to the Ugrian branch of the Finnic stock, crossed the Danube in that year. Nicephorus tells us of five Bulgarian hordes. The first remained in its original abodes by the Sea of Azov and the Kuban, the second under Cotragus crossed the Don, the third settled in Pannonia, the fourth went into Italy, and the fifth established itself in Bessarabia under Isperich. This is probably not quite correct. Moesia was conquered by Isperich at the end of the seventh century; some Bulgarians settled on the Volga, where traces of their race and language still remain; others lived in Hungary near the Avars, and sent a branch into Italy who settled close to Isernia. By the beginning of the ninth century the Bulgarian kingdom included half the peninsula. The connexion between Slavs and Bulgarians in these countries has been a great difficulty to ethnologists. Some have supposed that the modern Bulgarians are mainly of Finnic origin, and are therefore different from the Servians and other Slavonic nations. Others have imagined that they were themselves a Slavonic race, and that the country between the Danube and the Balkan is occupied by a homogeneous people. The truth was first established by Schafarik in his *Slawische Alterthümer*, published in 1837, and has since been confirmed by others. According to his view the Bulgarians were, indeed, of the Ugrian stock, but those of them who conquered the Southern Slavs were few in number and were rapidly lost in the mass of the conquered. The manners of the Bulgarians were essentially different from those of the Slavs. They were polygamous, the men wore trousers, the women were veiled. They were of a warlike and savage disposition; their government was aristocratic; they rapidly became converted to Mohammedanism. The Bulgarians gave their name to the country they conquered, but did not otherwise affect it. No trace of them can be found in the language or manners and customs of the modern Bulgarians. In 250 years the transformation had been complete, and the Bulgarians should henceforth be regarded as a purely Slavonic people. In the same way the Scandinavian Varagi disappeared in Russia, the Lombards in Italy, and the *Ρωμαίοι* in Greece.

The Bulgarians crossed the Danube in 679, and were converted to Christianity in 804. During this time they were engaged in constant struggles with the Byzantine emperors. Their chief princes were Krum, Omortag, and Boris. Krum succeeded to a kingdom extending from the Balkan to the Carpathians; he defeated the Emperor

Nicephorus in 811; he conquered East Hungary, and aspired to the possession of Constantinople, but could not take it, and died in 815. Omortag succeeded in 820; he persecuted the Christians: an inscription in Greek characters commemorating the building of his palace on the Danube was discovered in 1858 in the church of Tirnova. The reign of Boris, begun in 852, witnessed the conversion of Bulgaria by the two brothers Constantine (commonly called Cyril) and Methodius; one was a cleric, the other renounced a lay career to become a monk in the cloister of Olympus. They first converted the Bohemian and Pannonian Slavs. Boris, as others have done before and since, became a Christian for political reasons. His nobles, the Boljars, revolted and were suppressed. It is strange to find that from the very first Bulgaria was the battle-field of different ecclesiastical jurisdictions. Its possession was hotly disputed between Constantinople and Rome. Boris at first inclined to the latter, but, quarrelling with the Pope, received bishops from Constantinople. The two brothers, with the approbation of the Holy See, drew up a Slavonic liturgy, and the invention of the Cyrillic alphabet is attributed to Constantine. Constantine died in a monastery at Rome, having taken the name of Cyril. Methodius became first Bishop of Pannonia in 885. His pupils settled in Bulgaria and consolidated the existence of the Church. Boris resigned the throne in 888, and died in 907.

Symeon, son of Boris, who reigned from 893 to 927, is one of the greatest names in Bulgarian history. During his lifetime Slavs were settled in different kingdoms in one unbroken line from the Elbe to the Eurotas. But the Magyars, a Finnish race invited by the Byzantine emperors, broke into this dominion, and, overrunning Germany, formed a wedge between the northern and southern Slavs. The capital of Symeon was in Preslav, the ancient Marcianopolis. He was the first to assume the proud title of Czar.

Symeon's successor, Peter, was a quiet, peace-loving man; under him the power of the Bulgarians declined. In 963 the Boljar Shishman rose against him in revolt, the empire was divided, and Macedonia and Albania were formed into a second dominion under Czar Shishman I. The Bulgarian religion took a more sombre character, and the patron saint of Bulgaria, John of Rhyl, lived in Peter's reign. From this time, also, dates the heresy which, after profoundly influencing western Europe, made the name of Bulgarian a term of reproach and scorn in France. The sect of Paulicians had been long numerous in Bulgaria, but at this period they were reformed or organised by the Pope or Priest Bogomil. The essence of the Paulician teaching lay in the antagonism of the two principles of good and evil in man and nature. Bogomil connected this with old Slavonic mythological ideas of a similar character. This is not the place to give an account of the creed of the Bogomils. They were divided into two classes: the simple adherents to the faith, and the perfect Bogomils, who lived a strict life, and might not hold converse with an unbeliever. There can be no doubt that this schism by weakening the national

Church also weakened the nation, and eventually prepared the way for Turkish conquest.

The end of the two Empires was not long delayed. In 969 East Bulgaria was overrun by Russians. John Tzimiskes, Emperor of Byzantium, drove them out, but the Bulgarian Czar was not restored to the throne which he had lost, and after a glorious existence of 300 years this division of the Empire came to an end. The western kingdom survived a little longer under the rule of the Shishmanids. Its chief strength lay in Macedonia, and its principal towns were Belgrade, Nisch, Sophia, Ochrida, and Joannina. Against this western kingdom were directed the efforts of the Emperor Basil II., which procured for him the name of *Βουλγαροκτόνος*. He conducted no less than three Bulgarian wars, in which his chief antagonist was the Czar Samuel. After a struggle of forty years the kingdom of Ochrida was destroyed. Basil celebrated his triumph in Athens in 1019; an inscription in the Parthenon recorded his victories. The Bulgarian Empire was no more; the monarch of Byzantium ruled from the Danube to the Euphrates, from the Drave to Cyprus. The Bulgarian Church still survived, but the bishops were nominated from Constantinople. In A.D. 1020, 30 bishops and 685 clergy were clustered round the metropolitan see of Ochrida. This period of servitude lasted till 1186. It was a degraded and unhappy time. The Bogomils, the national heretics, extended themselves throughout Europe. They bore in various countries the names of Babunes, Manichaeans, Publicians, Patarenes, Kathari (Ketzers), Albigenes, Texerantes or Tisserants. They called themselves *boni Christiani* or *boni homines*. They often sealed their faith with their blood. Their Bulgarian origin was not forgotten; even now the traces of the disgrace of heresy which cling to the nation may have prejudiced some minds against them. It is perhaps more important that by their means intercourse was maintained between Eastern and Western Europe, which was further developed by the mightier movement of the Crusades.

At length the weakness of the Byzantine Empire gave an opportunity for revolt. Two brothers of a noble family, Peter and John Asen, raised the standard of their country. Peter was crowned Czar of the Bulgarians and the Greeks. The dominion of this family lasted till 1257, when it expired in the third generation. Kalojan, the third brother, contributed not a little to the conquest of Constantinople by the Franks. He obtained a legal title among the sovereigns of Europe by being crowned King by Pope Innocent III. in 1204. He conquered the Franks at Adrianople in 1205, and died two years afterwards. The culminating point of this dynasty was reached by John Asen II., who reigned from 1218 to 1241. He made Tirnova his capital, the birthplace of his race. He filled the city with castles and churches, and a proud inscription in the cathedral still records how he extended his victories from Adrianople to Durazzo.

Another dynasty, of the family of the Terterij, flourished in the last twenty years

of the thirteenth and the first twenty of the fourteenth century. After their extinction the supremacy of the Balkan peninsula passed to a different Slavonic power. An attack on Constantinople failed; the battle of Velbujd, fought on June 28, 1330, gave the Servians a complete victory over their kinsmen. In 1346 Stephen Dushan was crowned "Czar of the Servians and the Greeks," and raised the Servian power to its highest point. His empire extended from the Gulf of Arta to Belgrade, from Dalmatia to the Mesta. Alexander, the Bulgarian Czar, lived in friendly alliance with him. But the end of both was at hand. The Byzantine Emperors sought the aid of the Turks to prop their falling fortunes. In 1353 Suleiman crossed the Hellespont, and established for the first time the Moslem power in Europe. His troops rapidly spread as far as the shores of the Maritza. The war was long and bloody, but in twelve years' time Murad I. was able to change his seat of government from Broussa to Adrianople. The Servians were the first to succumb. They were beaten on the Maritza on September 26, 1371. On June 15, 1389, was fought the great battle of the Amselfeld, whose plains were covered for years afterwards with the bleaching bones of the slain. In the morning twilight the Sultan Murad I. was murdered, and succeeded by Bajazet. The new Sultan celebrated in the evening a complete triumph over the Servians and the Southern Slavs. Tirnova was taken in 1393, and the subjection of Bulgaria was complete.

We have no space to dwell upon the centuries of servitude which succeeded this calamity, but the account of them in this work will be found full of instruction. The Turks have altered very little in 500 years, and the condition of their subjects has become worse. Bitter as the servitude was, it was probably most endurable in the sixteenth century, when the Turks were at the summit of their power, and could afford to be generous. As the Turkish empire sickened and languished and began to decay from within, the condition of the subject provinces steadily deteriorated. From the middle of the fifteenth century the national feelings of the Bulgarians became weaker, and Greek language and culture expelled Slavonic. The introduction of Fanariote clergy, the instrument and the effect of their last and lowest degradation, dates from the year 1712; and the beginning of our present century marks the furthest ebb of national consciousness. Since that time the recollection of their past glories has revived. Bulgarian history has been written, its literature explored, and the emancipation of the Bulgarian Church from the thralldom of Constantinople has opened new prospects and encouraged new hopes. Bulgaria has now newspapers as well as books; but for an accurate account of new Bulgarian literature, as well as of the population of the countries in which the Bulgarians dwell, we must refer our readers to the work itself; we will only say that the author estimates the whole number of Bulgarians in every country at five millions and a half. We fear that the form of the book is too

essentially German to lend itself readily to translation, but it might easily be worked up into an English shape. In any case its perusal would tend to preserve a reader from many mistakes, and to rouse a just and generous enthusiasm for the fate of an historical people who have to boast of a glorious past, and may, perhaps, look forward to a future no less illustrious.

OSCAR BROWNING.

Biographical Annals of the Civil Government of the United States, during its First Century. By Charles Lanman. (Washington: James Anglim; London: Sampson Low & Co., 1876.)

MR. LANMAN'S *Dictionary of Congress*, the first edition of which was issued in 1859, has been very generally accepted, both at home and abroad, as a standard work of reference, and its convenience for identifying the numerous persons, of more or less notoriety, whose names are constantly occurring in current American journalism, has been fully appreciated by English writers and others who desire to be familiar with the progressive history of the great Republic. The author's official position at Washington afforded him peculiar facilities for performing what was really a laborious and anxious task, for the names with which he had to deal were almost legion, and, as many of them were those of individuals whose only importance consisted in the fact that they had found their way into the Congressional Chambers by means of the extraordinary machinery of American politics, it was often difficult, and sometimes impossible, to obtain any details of their personal history that would have been creditable to themselves or particularly worthy of record in a volume of national annals. Still, recognising the fact that the practical value of such a work would be greatly lessened if the list were left incomplete, Mr. Lanman omitted the name of no person who had ever held a seat in either House of Congress, and, in the cases of doubtful character, contented himself with a rigid *résumé* of their public antecedents, or, as would be said in America, their "record." In the volume before us, which is simply a revised edition of the *Dictionary of Congress*, with extensive additions to be hereafter noticed, Mr. Lanman has maintained the same system. Thus, the well-known William M. Tweed is handed down to posterity in the following terms:—

"Born in the city of New York April 3, 1823; received a common-school education; was by occupation a chair-manufacturer; was an alderman in New York city in 1852; a member of the Thirty-third Congress; a member of the State Board of Education in 1857; a Supervisor of New York county in 1858; and a State Senator in 1867: in 1874 he was arrested, tried, and found guilty of robbing the city of New York, by virtue of his official position in the city government, of a very large amount of money, and he was sent to the Penitentiary for twelve years, but, in December, 1875, he made his escape from prison."

There is not a word too many or too few in this concise biography, which tells us all that we need ever care to know about its subject. It is his "public record" rigidly epitomised. Take another case, that of the

equally notorious John Morrissey. Mr. Lanman says:—

"He was born in the town of Templemore, Tipperary county, Ireland, February 12, 1831; emigrated to the United States when five years of age, and for many years resided at Troy and Lansingburg in New York; worked for a time in a paper mill, and afterwards learned the trade of a brush manufacturer; was subsequently engaged as deck-hand on a Hudson river steamer, and then became a runner for a steamboat company in New York city; in 1852 he made his first appearance in California as a professional gladiator or pugilist; returning to New York, he participated in several encounters which gave him a wide reputation in the sporting world, and, after winning what is called the 'championship,' in 1858, he relinquished the profession: he subsequently entered into politics, and in 1866 was elected a Representative from New York [city] to the Fortieth and Forty-first Congresses, serving on the Committee on Revolutionary Pensions; was a delegate to the New York Convention of 1868, and in 1875 elected to the Senate of New York."

It may be safely assumed that Mr. Lanman was animated by no personal pleasure or national pride when, in the performance of his duty, he penned this paragraph; but such is the "public record" of this notorious personage. In omitting the facts of his private record Mr. Lanman probably exercises a wise discretion.

In contradistinction to the sketches of the two "black sheep" already named, let us have Mr. Lanman's account of the new Republican nominee for the Presidency, whom, with a singular unanimity, London editors appear to regard as the most uninteresting and obscure of all the recent candidates. According to our author, who wrote long before the nomination was dreamed of, Mr. Rutherford B. Hayes was "born in Delaware, Ohio, October 4, 1822; graduated at Kenyon College, Ohio, and at the Law School of Cambridge; adopted the profession of Law; was City Solicitor of Cincinnati from 1858 to 1861; Major and Lieut.-Colonel of the 23rd Ohio Volunteers in 1861; Colonel of the same from 1862 to 1864, when he was appointed a Brigadier-General, and during the same year was elected a Representative from Ohio to the Thirty-ninth Congress, serving on the Committee on Private Land Claims, and as Chairman of the Committee on the Library: he was re-elected to the Fortieth Congress; resigned in the summer of 1867, and was soon after elected Governor of Ohio: in 1868 the degree of LL.D. was conferred upon him by Gambier College: in 1875, after a severe contest, he was again elected Governor of Ohio."

Now, to anyone who thoroughly understands Americans and American politics, this appears to be a capital "record"—much better than that of any of the other candidates for the recent Presidential nomination, and infinitely superior to that of any incumbent of the Presidential chair known to the present generation. Whether it reveals the stuff from which Presidents ought to be made is another question, but we have before us, by means of these curt facts, an educated man; a graduate of one of the first Law Schools in the world; whose professional status was such that his services were sought and secured by one of the most important Western cities; who, having patriotically sacrificed his private interests during the recent war, rose from one of the humblest to one of the highest ranks in the military service; whose career was so ap-

proved by his immediate constituents that they made him their representative in Congress, not only once, but, deliberately, twice, and then elected him to the highest office in their gift; and who, in that important post, performed his duties so satisfactorily that he was selected the second time to be the Governor of one of the most powerful States of the Union. It is thus that the skeleton biographies of Mr. Lanman may be clothed with solid flesh, and endowed with life and animation.

Enough has been said to show the general character of the book before us. A new edition of the *Dictionary of Congress* being required, the author very wisely determined to extend its scope, and the present volume embraces, besides the complete Congressional list, the names and public services of all such persons as have, in a prominent manner, been identified with the National and State Governments of the Republic, during the first century of its existence. The classes included are, according to the author's statement,

"the Delegates to the Colonial and Continental Congresses; the Senators, Representatives, and Territorial Delegates of the Federal Congresses; Cabinet Ministers; Justices of the Supreme and other Federal Courts; Officials of the Executive Departments; Governors of States and Territories; Diplomatic Ministers; and such other men as have held positions of honour and trust in the Civil Service, exerted an influence on public affairs, or acquitted themselves with acknowledged credit."

In a few instances the line has been, perhaps not improperly, overstepped, and no one can object to the appearance of the names of men who have been eminent in the military and naval history of the country, although never holding any civil position. Besides the personal notices, which occupy nearly 500 closely-printed pages, Mr. Lanman gives upwards of 200 pages of tabular records intimately connected with the general scope of the volume, all more or less interesting and important, and some especially valuable, by means of which accurate data may be obtained upon almost any subject relating to the political, judicial, or diplomatic history of the country; while copious indexes, classified and general, enable the enquirer to turn to any class of officials, or to any particular name, with the greatest readiness.

Too much praise cannot be awarded to Mr. Lanman for the manner in which he has avoided all personal and partisan comments, the temptation to indulge in which must at times have been very strong, and the difficulty of resistance almost overpowering. The entire absence of them gives an assurance of the great care bestowed upon the biographical sketches, and inspires confidence in their accuracy. So far as the writer has been able to test the details concerning persons whose history is well known to himself, he has not been able to detect a single inaccuracy, either in fact or date, or to recognise a line or a word that ought to have been omitted. This is high praise, but it is justly due, and Mr. Lanman is entitled to the cordial congratulations and grateful acknowledgments of his own countrymen for the admirable manner in which he has accomplished his most difficult task, and no less to those of historians and other writers

abroad, to whom his volume, so far as American biography is concerned, must become a necessity.

JOSEPH LEMUEL CHESTER.

Sermons on the Sacraments. By Thomas Watson, Master of St. John's College, Cambridge, Dean of Durham, and the last Catholic Bishop of Lincoln. First printed in 1558, and now reprinted in Modern Spelling, with a Preface and Biographical Notice of the Author, by the Rev. T. E. Bridgett, of the Congregation of the Most Holy Redeemer. *Permissu Superiorum.* (London: Burns & Oates, 1876.)

THE name of Bishop Watson of Lincoln is known in a very limited sphere of readers, and we fear the attempt to resuscitate it will not enlarge that sphere to any considerable extent. Nevertheless, the editor of this forgotten volume of sermons deserves the thanks of all who desire to see any light thrown on the much misunderstood religious controversies of the reigns of Edward and Mary. In the biographical notice prefixed to the sermons he has collected into about sixty pages all that has ever appeared in print concerning their author, to which he has added all that could be gleaned from a search into the Public Records and the Privy Council Registers of the reign of Elizabeth; and readers may judge for themselves, both from the style of the sermons and from the fair and impartial account given of the facts of his life, how utterly undeserved is the character given of him by Strype as being "altogether a sour and morose man." Watson was one of those martyrs of Elizabeth's reign of whom till lately so little has been known, who, like Bonner and Harpsfield, bore witness to the sincerity of their faith by suffering a life-long imprisonment for it. In an historical point of view the character of the individual is of less importance; but we must confess we were wholly unprepared for such a set of sermons on the seven sacraments. Not only are they extremely valuable in themselves, but the allusions in them incidentally illustrate the teaching of the reign of Edward VI. in a way which we little expected. The editor thinks these sermons were printed with the view of their being preached by others. That may be so; but what is far more evident from their contents is that they were meant to obviate the ill effects of the teaching of Edward's reign, and to instruct the laity what they ought to believe as to the elementary truths of religion, which had been so overlaid by the Zwinglian and Calvinistic teaching prevalent at the time. Indeed, if it were not for the fact that the expression "(good people)" occurs in a parenthesis at the beginning of each sermon, and that they conclude with the usual form of sermon-endings, no one would ever have guessed that many of them were sermons at all. They are rather a series of instructions as to what people ought to believe as regards the sacraments—with an explanation of the meaning of the ceremonial used, and directions how they ought to be administered. The book is, indeed, as far as its subject goes, a perfect manual of theological teaching, and might serve for such even in

the present day with scarcely any alteration. It would prove most serviceable in the composition of sermons, and is perhaps most remarkable for the common-sense way in which it treats the bearing of doctrine on practice. Much also may be learned from it incidentally: as, for instance, in the sermon treating of the Mass, which contains an explanation of the meaning of the ceremonies and vestments used. It throws, also, considerable light on the habits of the day. Thus it appears from the author's elaborate explanations on the subject of matrimony that it was the common practice of the day to contract marriage without any religious ceremony. And, as the editor observes, the Bishop seems to attach no blame to this, provided the nuptial blessing were afterwards received in church. In another place it is implied that baptism by immersion was customary in England in the sixteenth century. And it is remarkable how little evidence as to both these points exists in any other publications of the period. We much wish that we had space to notice this extremely valuable volume more at length; but we must conclude with saying that it has been well and carefully edited—the only fault we have to find being that there are some unnecessary explanations of forms of expression which are slightly obsolete; and in one instance an unfortunate attempt at an explanation of a mere misprint, *walter* for *weller*, where the editor has suggested the substitution of the word *wallow*. We hope the book may attain the amount of circulation which it well deserves.

NICHOLAS POCKOCK.

Palestine and Syria. Handbook for Travellers, Edited by K. Baedeker. (Leipzig: Karl Baedeker, 1876.)

MR. BAEDERER has missed his opportunity. Many a traveller in Palestine, wearied with the prophetic fervour of Dr. Porter, must have longed for a guide-book which without being deficient in accuracy—detailed accuracy where the interest was sufficient—should yet be concise, impartial, directing attention only to what was of real and general interest, written in a clear style, printed so as to be easily read on horseback, and of moderate price. Now, it cannot be said that Baedeker's Handbook meets these requirements. Though avoiding the peculiar diffuseness of Dr. Porter, it enters minutely into points which are not likely to interest the majority of travellers in Palestine, and produces consequently a general impression of being dull and dry; it is printed, as are all the same publisher's Handbooks, in very poor type—some of it so small that to read it, as it must very often be read, on horseback in strong sunlight is very trying to the eyes; and—it costs one pound.

Smith's *Dictionary of the Bible*, Porter's *Handbook* (Murray), and the publications of the Palestine Exploration Fund, contain the pith of pretty nearly all the information at present attainable about Palestine, and the compiler of a new guide-book to the country has little else to do but use to the best advantage the materials thus provided, and adapt them judiciously to his particular purpose. But, though there was not much

scope for the introduction of fresh matter into the present guide-book, we are glad to be able to note that it is an independent work, fairly compiled from the various sources that lay to hand. Too many of Mr. Baedeker's Handbooks, while showing ample and satisfactory evidence that the hotel, railway, and other such-like information, had been obtained at first-hand and on the spot, are little else, so far as the historical and descriptive matter goes, than abridgements of Murray's Handbooks.

The introductory portion of the work under notice contains a good deal of useful information, carefully and judiciously put together. The articles on "Cafés," "Baths," "Bazaars," "Tobacco," "Mosques," and "Intercourse with Orientals," are among the best. The Geographical Notice, with its sub-sections, is well done, though the enthusiastic sportsman must not place too much faith in some of the statements contained under the heading "Fauna," such, e.g., as that "the gazelle is common both in the plains and among the mountains;" that "the mountain goat of Sinai is frequently seen in the mountain gorges around the Dead Sea;" that "wild ducks are very numerous in the plain of the Jordan;" that "on all the hills the *Caccabis saxatilis*, a large and beautiful kind of partridge, is very numerous;" and that "quails occur in all the cornfields of the plains." The fact is there is very little sport of any kind to be had in Palestine, and it is hardly worth while to carry a gun at all, except for the purpose of collecting specimens. What, by the way, are "becassins," by which the plain of Jezreel and other localities are said to be frequented? Is it a misprint for "bécassines," the French for snipe? But if snipe are meant, why not in an English book call them so?

A chronological table of the principal events that have happened in a country is a valuable addition to a Handbook, but any attempt to give a history is, we think, a mistake; it must necessarily be short and imperfect, and of no use consequently either to those who have or to those who have not any previous acquaintance with the subject, and both will regret the increase it causes in the bulk of the volume.

The account given of the present population of Syria is very superficial and inaccurate. No mention is made of the *fellaheen*, the resident so-called Arabic population of the towns and villages, of whose probable descent from the old Canaanite inhabitants and remarkable manners and customs M. Clermont-Ganneau gave such an interesting sketch in his article on "The Arabs of Palestine" in *Macmillan's Magazine* for July, 1875. The labours, however, of this eminent scholar do not anywhere in the book meet with much acknowledgment. His discovery of one of the tablets described by Josephus as placed at intervals on the balustrade that separated the inner and outer courts of the Temple, and as bearing in Greek and Latin an inscription prohibiting foreigners under pain of death from entering into the inner court, is one of the most interesting yet made in Palestine, and well worthy of due recognition; but the only allusion made to it in this Handbook is in the middle of the description of the Temple, where

the following sentence occurs in brackets:—"A notice of this kind in Greek, closely corresponding with the description given by Josephus, was found a few years ago" (p. 165). Similarly the discovery of the ruins of the royal Canaanitish and Levitical city of Gezer at Tel el Jezer, near Abou Shushah on the road between Ramleh and Jerusalem, is barely mentioned at p. 137; and yet the two bilingual inscriptions carved on the rock in Hebrew and Greek containing the Biblical name "Gezer" written in full, which M. Ganneau found there in 1874, are of the very greatest interest and importance, for not only do they verify his already (in 1870) proposed identification of the site, but they serve by their respective positions to determine what were the limits both of the Levitical cities and their suburbs (Numb. xxxv. 4, 5), and of the Sabbath-day's journey of the New Testament. It is true the merit of the discovery is attributed to M. Ganneau in the short account given of the work of the Palestine Exploration Fund at p. 126; but, considering the minuteness of detail which generally characterises the Handbook, the importance of the inscriptions demanded more extended notice. More, too, might have been said about the position of Adullam, which M. Ganneau was the first to propose to identify with some ruins called Ayd el Miyeh, not far from Shuweikeh, the ancient Shocoh, and south-east of Beit Jibrin; while of the stones found by him at Siloam, and now in the British Museum, bearing inscriptions in the same character as the famous Tablet of King Mesha, commonly called the Moabite Stone, no mention at all is made.

There are many other instances, however, in which the results of recent exploration and research do not obtain due recognition, and some, indeed, in which no notice at all is taken of them. For example, no mention is made of the tombs of the Maccabees at El Mediyeh; of the position of "Aenon, near to Salim," where John the Baptist baptised, now almost certainly identified with the village of Aynoon, near another village called Salim, east of Nabloos; of the votive inscriptions of the Tenth Legion found close to the Church of the Holy Sepulchre; of the proposed identification of Bethesda with the site now occupied by the Church of St. Anne, where, as M. Ganneau has shown, tradition placed the house of the mother of Mary, and called it Beit Anna, a name which has the same meaning as Bethesda, "House of Mercy"; of the finding outside the Damascus Gate at Jerusalem of a bust of Hadrian, which, if not a portion of the actual statue of himself placed by that Emperor in the Temple of Jupiter Capitolinus which he erected on the site of Moriah, may at any rate be considered as belonging to one of the many reproductions of the statue which no doubt were made at the time; of the discovery of the ancient Jewish cemetery at Jaffa; of the remarkable ruin at Mashita or Umm Shutta, in the desert east of Moab, first seen and described by Dr. Tristram, and conjectured by Mr. Fergusson to be the remains of a palace erected by the great Persian conqueror Chosroes II. in the year 614 A.D. Many other examples might be given of subjects

of interest either left unnoticed altogether, or treated with less fullness than their importance required. It is possible that the compiler of the Handbook may not have considered them of interest, or did not agree with the conclusions drawn from them; but the answer to this is that a Handbook is bound to present its readers with an account of all that is known and thought by good authorities on the matters it treats of, indicating, it may be, to what opinion the balance of proof or argument points, but omitting nothing which may help them to form their own judgment, because the estimate of the compiler affixes no value to it. A flagrant instance of the violation of this, as we conceive, sound rule occurs at p. 288, where in treating of the history of Jebel Usdum it is remarked:—"The attempt to place the valley of Siddim in the region to the north of the Dead Sea appears to us, from all we know at present, to be a failure." But none of the arguments in favour of so placing it are given.

The routes are judiciously chosen and well arranged, but there is too much of an Itinerary about them. An Itinerary should certainly precede each route, as it is exceedingly useful for reference; but it is a mistake to mix up with the description of the generally interesting features of the country the names of a number of more or less insignificant places which serve only to confuse and puzzle the traveller as he rides along. The times given between place and place in all the routes are, as a rule, too short. Of course any one on a good horse, and unencumbered with much baggage, may cover the ground in even quicker time, but the regular rate of speed for a party travelling with tents and baggage will be found to be about ten minutes in the hour slower than the time of the Handbook. The average pace of desert travelling on camels is from two to two-and-a-half miles an hour, and of Syrian travelling on horseback from two-and-a-half to three miles.

As usual in Mr. Baedeker's Handbooks, the maps and plans are numerous and well done. We must, however, take exception to the mode of spelling the names adopted in the former, and indeed to the whole system of transliteration in use throughout the book, as involving a jumble of dots, commas, and accents, which confuse the eye and puzzle the memory. It is almost hopeless to attempt to transliterate Arabic at all in such a manner as will enable a person ignorant of the language to pronounce words intelligibly, but we are quite sure that the simplest method of rendering the sounds of the different letters is likely to be at least as successful as the most elaborate, besides being much easier to understand.

It is a great pity that some uniform system of Arabic transliteration satisfactory to the scholar and intelligible to those who do not know the language cannot be agreed upon. The want of it is especially felt as regards Palestine, where the names of places have a special interest in many ways for so large a class of readers who, as things stand at present, are constantly in doubt whether the name they read in one book is the same as that given in another, and who consult a map only to find neither. The Committee

of the Palestine Exploration Fund have decided on adopting Robinson's and Smith's system in all their publications, and in the Ordnance Survey Map which they are about to publish; and, as this map will in all probability be more generally used than any other, it will be for the general convenience of readers if writers will adopt its nomenclature, even though they may not agree altogether with the method on which that nomenclature is based. FRED. A. EATON.

The Life of Charles Richard Sumner, Bishop of Winchester: during a Forty Years' Episcopate. By the Rev. George H. Sumner, M.A., Hon. Canon of Winchester. (London: John Murray, 1876.)

"THE race is not always to the swift, nor the battle to the strong." Were they so, it might be a puzzle to discover the secret of the rapid but sure steps up the ladder of his profession, accomplished by the so-called "last of our old Prince Bishops." On the rule of "seniores priores" and of "detur digniori," so far as school and university honours were concerned, his brother John, ten years his senior, should have been the first to mount the bench of Bishops. But Charles Richard, who was superannuated for King's, and went through Eton and Trinity without achieving much special distinction, is found at the age of thirty-six consecrated Bishop of Llandaff, from which see in the next year he was translated to Winchester; whereas it was not till 1828, the next year, that his brother was raised to the see of Chester. Probably few would say of either that they were men of the first rank in ability, intellect, or administrative power; and yet both rose so high, and the younger for so long outshone the elder and more learned, that it is with curiosity we dive into Mr. George Sumner's biography of his father, the Bishop of Winchester, to seek some clew to the phenomenon. It was not to be expected that a son's biography should be impartial, but we give Mr. Sumner all the credit for intending it to be such in his case; and it may be added that the modesty, simplicity, and refinement which have ruled his pen raise his work above the range of ordinary biographies, and make it infinitely more trustworthy than a chapter or two of *Our Bishops and Deans*. If it has not the good stories which enliven Denison's *Life of Bishop Lonsdale*, or the biography of Bishop Blomfield, still it is a by no means uninteresting chronicle of events in Church, State, and Society during forty years, over which old-stagers who have lived alongside the course of those events may with amusement and interest run their eye.

It would be affectation to ignore the long-believed and oft-told story of the bishop's marriage at Geneva to save a noble pupil from what would have been deemed a marriage beneath him; and yet, even if Sir John Coleridge's authority had not sufficed to contradict the story, it was not necessary or natural that Mr. Sumner should refer to it. That which must be patent to every one is, that, thanks to his having for pupils two young noblemen, whose mother, the Marchioness of Conyngham, was all-

powerful with George IV., that monarch took an extraordinary and persistent interest in the young tutor from the very commencement of his reign. The testimony of other pupils besides Lord Mount Charles and Lord F. Conyngham (notably of Mr. Frederick Oakeley) tends to show that as a tutor and guide of youth Charles Richard Sumner had special gifts and aptitudes, which doubtless secured a mother's gratitude and so, by consequence, a friend at Court; but probably he was the only curate whom a king would have lifted *per saltum* to a canonry at Windsor, had not his Prime Minister stood out against a step so entirely without precedent. "The king's feelings," we learn from the correspondence, "were mortally wounded" for a little space, but he found a speedy "heal-all" in other preferments: a private chaplaincy to the king, the living of Abingdon, a canonry at Worcester and at Canterbury, and the bishopric of Llandaff, all within five years. In this part of the biography it is with an odd sensation that we read of George IV. in a new light, solicitous even to fidgettiness about the details of divine service and points of ritual, but yet amenable to rebuke from his chaplain, who is found in p. 78, teaching him that "all are alike before God's throne," and, in p. 79, granting that chaplain's petition (when asked what mark of royal favour he would propose) to institute daily family prayers in his household. With such tokens of his Majesty's ear, and external signs of rising consequence, we are not surprised to find the chaplain and canon declining the colonial see of Jamaica, and, after one or two collateral honours and compliments, and a bit of literary work—his translation of Milton's *Treatise on Christian Doctrine* (memorable because it is his sole identification with literature, because it was dedicated to the King, and because Lord Macaulay found words of praise for it in his *Essays*)—taking Sir William Knighton's hint to "get rid of his shirt-frill and trowsers," in other words "to take his doctor's degree," and so to be ready for a bishopric. When Llandaff, which then carried the deanery of St. Paul's "in commendam," was offered and accepted, the King wrote to Sir William Knighton that "he should leave London at ease, this business being settled and well settled." It was a good day for the second South Welsh see; and though his pluralities—a mere trifle compared with many then calmly enjoyed by episcopal occupants—sorely interfered with a thorough reform and revival of the Church and clergy in Monmouth and Glamorgan, it is certain, from other evidence than his son's pages, that Bishop Sumner began the work with tact, considerateness, simplicity of life, and self-dedication to his task. It was beginning to be discovered that, besides a fine presence and grand courtly manner (which we are told in a note got him the *sobriquet* of the "Beauty of Holiness," a nickname, by the way, which we suspect belonged before him to Bishop Hurd), Bishop Sumner had views and principles of episcopal work, when within little more than a year of his going to Llandaff he was translated to the grander and more prominent diocese of Winchester. "This," said the King,

"will please the Marchioness." It may have been that this advancement involved a traditional accession of personal dignity; for, though his simple life at Llansanffraed, and the fact we learn later on that after his wife's death he slept the rest of his life in a mere servant's bedchamber in Farnham Castle without any change of furniture, bespeak a natural preference for plain living, certain it is that general impression and remembrance associate more state with the Bishop of Winchester than with his elder brother, even when at Canterbury and Lambeth. Nothing carried the latter out of his simple ways and habits; it seems to have been part of his brother of Winchester's rôle to look the Prince-Bishop; though a hundred traits of kindness, courtesy, and condescension might be cited to prove the deservedness of his popularity. Nor was the state he had to put on ever accompanied by self-indulgence, as witness a saying of his, which would make clergy and parishioners stare in these days of hot-air and hot-water apparatus, "the proper place for the stove is in the pulpit" (p. 146).

Once established at Farnham Castle he soon showed himself a bishop of the working school, at that time of very limited numbers. His first charge identified him with the moderate Evangelicals in doctrine, but urged the greater seemliness of churches and churchyards, with more services, more frequent communions, and other features of the soon-to-be-developed High Church programme. He had not been a year in his new diocese before he suppressed the misrule and quasi-carnival of Hop-Sunday at Farnham; and in the agricultural riots at the close of 1830 he showed a manly attitude, in giving the mob as well as the farmers audience, with a view to redress of grievances. In the visitations of the Channel Islands, a part of his diocese, which he was the first Bishop of Winchester to institute, and which he continued triennially, he on several occasions exhibited abundant courage afloat, and comported himself with thorough self-possession and gallantry in more than one peril of shipwreck. At once he set about the work of elementary education; and was one of the earliest prelates to establish a training-college for teachers; he gave a steadfast and warm support to Sunday Schools; and the number of new and restored churches in his diocese during his forty years' episcopate bespeaks both wonderful personal energy, and sagacity in the choice of instruments with whom to work. He was regular and methodical in his huge correspondence, and punctual in his appointments as to consecrations, confirmations, or visitations, in spite of the badness of roads. All accounts credit him with a princely hospitality, dispensed with the additional charm of great conversational powers.

In so protracted an episcopate it fell to his lot to have to take part and side in grave political questions. His vote on the Roman Catholic Relief Bill in 1829, in the majority of 109—with which his brother also voted as Bishop of Chester—had the effect of cooling his first and chief patron, George IV., towards him, and was in after years regretted by himself as an unavailing concession (p. 162, *note*). But it is an old saw

that no men so soon forget their maker as the Bishops. In the debate on the second reading of the Reform Bill in the Lords, he is found voting in the minority, while his brother was in the majority of nine in favour of it. When Queen Victoria met her archbishops and bishops at Kensington Palace on the morrow of King William's death, the Bishop of Winchester was present; and he took part, as prelate of the Order of the Garter, at her coronation—the second he had witnessed. In the same capacity he baptised the Prince of Wales in 1842, on which occasion the King of Prussia was made a Knight of the Order; but we confess that the Bishop's narrative respecting the King of Prussia's self-possession, the Queen's audible *accolade*, and the royal infant's beauty "as of one hired for the occasion," reads at this distance of time rather like a scrap of "Jeames's Diary." Greater and graver ordeals were his charge on Tract XC. in 1841, in which the trumpet gave no uncertain sound; his charge on the aggressions of Rome and on Ritualism in 1845; his temperate and cautious action in the Gorham case, when Henry of Exeter had excommunicated his brother, the archbishop, for instituting Mr. Gorham; and his plain speaking on the subject of "Private Confession" in the charge on Church Progress in 1858. It was obviously no small mutual advantage to the brothers that they could confer and co-operate upon urgent Church questions, and the attitude of both, if often verging on timidity, met with consideration and deference from a vast number of Churchmen who respected and appreciated their private worth and acknowledged earnestness. Among his later acts the Bishop's part in the Pan-Anglican Synod, in concert with the Bishop of Ohio, is said to have contributed to the happy and peaceable issue of that congress; and here he seems to have been guided by his own tact, in declining to widen the scope of the conference so as to deal with special points of error on one side only. He hardly shows to equal advantage, to our fancy, in his support of a petition to constitute the Surrey portion of his diocese into a separate see. Perhaps it was age and weakness that made him seem lukewarm. It was in 1868 that he was first seized with paralysis, but, through his naturally good constitution, he held on till August, 1869, when arrangements were made for his retaining Farnham Park and Castle for life, and for his being succeeded by Samuel Wilberforce, whom he had been the first to promote, and assisted to consecrate, and who, as it need not be said, died before his predecessor in the see. But Bishop Sumner's latest days, from 1869 to 1874, were almost a living death; his speech gone together with his power of writing his thoughts, he lingered, as his biographer writes, virtually "alone with his God."

Passing this episcopal life in review, its leading features are an even tenor of respectability, a well-bred and polished bearing, an unflinching common sense, and a consistent piety, adorned by a charity which grew riper and mellowed as age drew on. In his true help-mate, till he was bereaved of her in 1849, he possessed a like-minded fellow-worker, who made "his people her

people, and his gods her gods," and to whom—a mother in Israel—he owed very much of the happiness of his family relations to the last. At the time of his death the Bishop had seventy-eight lineal descendants, and the testimony of his staunch friends of a lifetime is that no home could have been happier. It speaks volumes that John Keble, Sir John Coleridge, John Henry Newman, Frederick Oakeley, and others of the same calibre and the like diversity of views, regarded Bishop Sumner with feelings of reverence or affection; while Bishop Wilberforce, Archdeacons Jacob and Wigram, and other ecclesiastics, more closely associated, co-operated with him through life with a loyalty which must have been inspired by love and confidence. If Charles Richard Sumner failed of greatness as a Bishop, he had many sound claims to the credit of goodness.

JAMES DAVIES.

Materials for the History of Thomas Becket, Archbishop of Canterbury. Edited by James Craigie Robertson, M.A., Canon of Canterbury. Rolls Series. (London: Longmans, 1875.)

In editing the contemporary literature relating to Becket, Canon Robertson declines to discuss either the character of the Archbishop himself, or the merits of the memorable controversy with which his name is associated. As he not unjustly observes, "in a work produced with the aid of public money it would be improper to obtrude opinions which might offend the conviction either of those who regard him with religious veneration or of those who estimate him very differently." This reason, however, apart, the task he has undertaken is itself one of such magnitude and difficulty that his resolution to avoid all but purely literary questions is not unnatural. Nine or more biographies, two voluminous collections of miracles, and an immense and chaotic correspondence are enough to tax the patience and energy of the most painstaking editor. What is most wanted is a complete and thoroughly trustworthy edition of all these materials; and if, as may be expected from the care shown in the first instalment, Canon Robertson gives us this, he will earn the gratitude of historical students more than by half a dozen brilliant prefaces.

The present volume contains the *Life* and the *Miracles of St. Thomas* by William of Canterbury, which, although apparently written at different periods, and the *Miracles* first, may be regarded as a single continuous work. It doubtless owes its position of honour to the fact that until lately the *Miracles* as a collection were entirely unknown, while the *Life*, with the exception of the extracts embodied in the composite biographies of Becket known as the *First* and *Second Quadriлоги*, was thought to have perished. It is interesting to learn that we are indebted for the preservation of what is apparently a unique copy of both *Life* and *Miracles* to another Chancellor-prelate only less famous than Becket himself. William of Wykeham bequeathed to his college at Winchester a certain "*librum de vita Sancti Thomae, vocatum Thomas*;"

and from this MS., which, after lying unnoticed for centuries, has at length been identified as the Canterbury Monk's missing composition, Canon Robertson takes his text.

As now first printed in full, the *Life* claims a place among the best of the many early biographies of the most famous of canonised Englishmen. Its one disappointing feature is the account of Thomas the Chancellor, which is wretchedly meagre. For this, indeed, the author has more excuse than some of his fellow-biographers. The editor gives good reasons for supposing him to have been a foreigner; and he certainly did not enter the monastery of Christ Church—probably, therefore, did not come to England—until after Becket had gone into exile. The greater part of his narrative, therefore, is not that of an eye-witness, which may possibly account, in some degree, for its straightforwardness and moderation. The author's candour is amusingly shown in the account of his own pusillanimity on the occasion of the murder at Canterbury. Naturally, it is for the events of the few weeks preceding this catastrophe, during which he was brought into personal contact with the Archbishop after his triumphant return to Canterbury from exile, that his *Life* is of most importance, as supplying deficiencies in those hitherto better known. The minute account of the negotiations with the younger Henry, "rex cismarinus," and his guardians is, in fact, William of Canterbury's special contribution to Becket's life-history. The proceedings at Winchester are reported so fully as to suggest that the author accompanied Becket's emissary, Prior Richard, to the Court. This is the more probable as we find him directly after so high in the Primate's favour that, out of all the monks of Christ Church admitted during his exile, William alone was deemed worthy of ordination to the diaconate in the Ember-week before his death. Every fresh detail of the discussion in the Council on Becket's request for an audience shows more clearly than ever how utterly hollow was the reconciliation between the lay and clerical powers. Unfortunately the words "pacificus venit nec quicquam mali molitur," with which Prior Richard began his speech, were at variance with the Archbishop's own anathemas. Of this advantage the latter's enemies were not slow to avail themselves, with the more effect because it was for the alleged unlawful coronation of the young king himself that Roger of York and his fellow-bishops were excommunicated. Thus Geoffrey Ridel's threat to leave the Council if the audience were granted, artfully prefaced by the assertion of his knowledge of the will of the "rex transmarinus," out-weighed all the arguments of the moderate party which the biographer puts into the mouth of the Earl of Cornwall. Whether the "archidiabolus" was merely interpreting the king's wishes by his own or not, none knew better than Becket himself that the repulse was little less than a death-warrant. It is significant, therefore, that in the list of grievances which he afterwards sent to the Council he returns to the "fonset origo mali," putting in the most prominent place the subjection of the clergy to the secular tribunals. This was something more than a

formal declaration of unalterable hostility to the most obnoxious of the Constitutions of Clarendon. It was a challenge to renew the contest on the original ground of dispute, discussion of which had been tacitly avoided in the negotiations between Henry and himself in France; and, as if to cut off all hope of compromise, the manifesto was supplemented by a threat of ulterior proceedings if the grievances—some of which, indeed, were admittedly real—were not all speedily redressed. It is vain to speculate what course events would have taken if Fitzurse and his fellow-assassins had not forced on a solution. It was no less impossible to allow the Archbishop, even if he had wished it, a second time to leave the kingdom and become a tool to forward French intrigue, than to suffer him to fulminate indiscriminate anathemas and paralyse the Government at home. That some violent issue, some "factum exitiabile," was regarded as inevitable is plain from the warning speeches of the Earl of Cornwall and others; and it was fortunate, perhaps, for Henry's fame that it came so soon, before his own share in it had gone beyond a few passionate words. It was even more fortunate for the reputation of Thomas himself. He might still, indeed, have won the double title of saint and martyr; but without the combination of circumstances which intensified in so remarkable a degree the universal horror excited by the murder at Canterbury he would scarcely have attained, still less have kept for more than three centuries, his unique position in the English hagiology. There is no more curious proof of his extraordinary popularity than the multitude of miracles which fill more than two-thirds of the present volume, to say nothing of those similarly recorded by Benedict of Peterborough. If, as the editor thinks, William of Canterbury held some office connected with the shrine, he must have enjoyed, as the recipient of the tales of grateful pilgrims, special facilities for making such a collection. It was begun, he tells us, seventeen months after the death of the saint, and when finished was sent by the monks of Christ Church at his own request to King Henry by the hands of the author. The strongest disbeliever in miraculous agency must admit that the contents are well worth printing, if only for the light they throw upon the social life of the time and other subjects left unnoticed by the chroniclers. Many of the tales are as interesting in this respect as the anecdote of the mother (not, as in the *Quadrilogus*, the wife) of Hugh de Morville given in the *Life*, which is so often quoted as a proof that English was already taking the place of French as the language of the Norman nobility. Every class is represented, from the king down to the foundling picked up in the road by Queen Eleanor; and the relations of husband and wife, of parent and child, and of master and servant, the marriage of the clergy, the state of medical science, the Irish war, and popular superstitions and folk-lore, are among the many various subjects incidentally illustrated. The arrangement is a natural one. First come visions confirming the reception of Thomas among the saints—to one visionary, by the way, we are indebted

for an *English* antiphon which he heard sung in his honour—then instances of the punishment of scoffers, and finally the long series of miraculous cures and still more astounding manifestations. The author becomes amusingly ironical in telling how even Foliot, Bishop of London—fortunately, perhaps, for him, English saints are not open to the charge of vindictiveness which Giraldus Cambrensis brings against their Welsh and Irish brethren—was made to owe his life to the saint whom he had persecuted in the flesh. In his case the cure was effected in a way the profanity of which was hardly excused by its success. While administering to his brother-bishop the *viaticum*, Jocelin of Salisbury "sacramentum adjungit sacramento et sanguinem martyris sanguini Redemptoris," with such effect that in a few days the dying man was on his way to the shrine of his preserver. Mention of this martyr's blood, or "aqua sanguine sancti rubricata," is extremely frequent. We have bottles of it sold at a shop in Canterbury, carried about the country by pilgrims, and hung up on the walls of rooms. It was commonly drunk by the sick as a universal specific; and no wonder, for a drop from a "phiala sancti Thomae" in many cases raised the dead. One of the most interesting miracles is the restoration to sight and manhood of one Ailward (p. 156), which illustrates trial by ordeal, the popular belief as to the efficacy of Whitsun-eve baptism, and, above all, the terrible severity of the criminal laws. Another (p. 295) is equally instructive as to the injustice of trial by battle, although in this case, thanks to the saint, and possibly also to the fact that before the decision "quantum potuit pugillandi didicit industriam," the honest, though weaker, man got the best of it. For curiosity few will compare with those in which the saint exercises his power upon the lower animals. His partiality for hawking did not end with his life, if we may judge from the cases in which he restores these birds to their owners when lost, or heals them when wounded or sick—among the latter being the king's favourite falcon, "qui pro strenuitate sua meruit Wiscardus appellari." It was, perhaps, from the same sympathy with sport that he did not interfere to stop the bull-baiting (p. 293) until the bull broke away and began to do mischief; but, then, the poor beast, unlike the starling in the talons of the kite (p. 529), had not learned to invoke his aid articulately. The gander (p. 359) was equally unfortunate in not being devoted to the saint until after the boys had amused themselves by wringing its neck; nor did it gain much after all by its restoration to life, though the miracle was beyond question, "test[is] sepulchrum martyris, ad quod [anser] allatus est, testes viri fratres, a quibus susceptus est et comestus"! GEO. F. WARNER.

It is hoped that Mr. Richard Grant White, of New York, will take the chair at the first meeting of the New Shakspeare Society next Friday, and reply to the arguments of the writer of the paper for the evening, Miss Lee, on 2 and 3 *Henry VI.*, and their originals, the *Contention* and *True Tragedy*.

NEW NOVELS.

Marks upon the Door. A Novel. By Mark May. (London: Sampson Low & Co., 1876.)

For Better, for Worse; a Romance of the Affections. Edited by Edmund Yates. (London: Ward, Lock & Tyler, 1876.)

Woodleigh Park, or the Power of Home. By Martha C. France. (London: S. W. Partridge & Co., 1876.)

The White Cross and Dove of Pearls. By the Authoress of "Selina's Story." (London: Hodder & Stoughton, 1876.)

Mercy Philbrick's Choice. (London: Sampson Low & Co., 1876.)

Marks upon the Door is a crude first attempt, not to be harshly judged, as, though very slight, there is some attempt at making its characters individual, and not merely lay figures. But the author's power of constructing a plot is as yet extremely imperfect, and the dialogue is rather stilted and forced, while the asides to the reader are not very judiciously managed. A very old stock device is employed to work out part of the story: that of a young Roman Catholic gentleman, known to be the heir of a wealthy man, being inveigled into joining a secret religious society bound by celibate vows, in order that his property may necessarily fall, for lack of heirs, into the hands of the Church. He is depicted as in terror of his life should he yield to his wish to marry his cousin, and as driven by excitement into crime and death. But it is really time that embryo novelists should begin to study facts before they weave improbable plots. There have been, no doubt, many ugly clerical will-cases before the courts, both of France and the United Kingdom, within the last few years, the most noteworthy of which is the protracted suit of the Lacordaire family against the Dominicans; but Mr. Mark May has forgotten two simple difficulties in the way of his ecclesiastical speculators: first, that a young man possessed of no money of his own, and dependent on a father whose property was all personalty at his own disposal, and not entailed realty, would be no such catch as to make it worth while running a great risk for a mere chance of succession under a will; and next, that if the victim felt such strong repugnance for his hasty vows, he had nothing to do but to apply in the proper quarter to be dispensed from them, and to give his Order a handsome sum down to be let off his contract, letting the authorities understand that, if refused his request, he would take care that his father's will should not be what they desired. Given the deadlock as put in the story, there is its obvious solution.

Is Saul among the prophets? The half-page of commendatory preface with which Mr. Edmund Yates launches his friend's progeny upon the waters of criticism touchingly urges its claims to attention as representing "a reaction from the feverish pursuit of sensation novels." Very good: but then what about *Black Sheep*, *A Silent Witness*, *Broken to Harness*, *A Rock Ahead*, *et hoc genus omne*? Clodius bearing testimony against the co-respondents of his day was nothing to this protest, which recalls

King Jamie's address to his goldsmith:—"O Geordie, Jingling Geordie, it was grand to hear Baby Charles laying down the guilt of dissimulation, and Steenie lecturing on the turpitude of incontinence!" As to the venture itself, it is a very ladylike, nice, pretty little story—other equivalent adjectives may be added at pleasure—perhaps a trifle goody, but eminently aristocratic in large parts of its company and scenery. It is something of the type of a novel which achieved a not-undeserved popularity a few years ago, called *Margaret and her Bridesmaids*, and is certainly fairly readable. But one's puzzlement does revive at finding included under the general sponsorship of Mr. Edmund Yates passages on the theological superiority of the Church of England over Quakerism, and the only solution open is that on which Charles Lamb fell back when Hazlitt, in sheer bewilderment, after a gorgeous theosophic oration from Coleridge, asked Elia to explain what could possibly be meant by all that had just been poured out on the subjects of regeneration, the office of the Church, and similar topics. "O, you know," stuttered Lamb, "there was always a g-g-g-great d-deal of f-fun in Coleridge!"

Woodleigh Park is a story of the old Evangelical school, written with an obvious sincerity which is entitled to respect, but not dealing very successfully with its main topic, which is a dissuasion from "worldly" society and amusements as incompatible with religion. The fault in the author's way of regarding the subject lies not merely in the narrowness of her school, but in the curious lack of consistency she exhibits. There is a great deal, for example, perfectly true and indisputable which can be urged against one object of her denunciation, fashionable balls, on various grounds, physical and ethical. But she is careful to explain that a regatta is just as sinful in her eyes, and that its real wickedness consists in its bringing Christians into contact with the world, by which term she means all persons who do not hold precisely her own religious opinions. Now, here is the point where the inconsistency comes in. Setting aside altogether the enquiry, which never presents itself to people of her calibre of mind, how far a society which, with all its faults, is permeated with Christian ideas and morality, is the world in the sense that the rotten Pagan society under Nero and Domitian, as Juvenal describes it, was the world against which the Apostles warned their half-reclaimed converts: it is plain enough that the strict letter of the New Testament has a great deal more to say about the evils and dangers of wealth and of physical ease than about the perils of mixed company. But her most Evangelical personages live in costly and luxurious houses, feed daintily, dress richly and handsomely, drive about in well-appointed carriages, are waited on by numerous servants, and enjoy to the fullest what must surely be as worldly as any regatta. "Self-indulgence," wrote Sir Arthur Helps several years ago, "takes many forms, and we should remember that there may be a sullen sensuality as well as a gay one." Just so, there is a wonderful piece of casuistry about Sabbatarian observance, regularly laid down

and provided for in the code of strict Evangelicals. It is wrong to have a hot meat dinner on Sundays, but you may boil the potatoes, and have them hot. Why it would be a sin to put a joint of meat into the same pot as the potatoes, or into another pot on the same fire, may be left to the judgment of those Rabbinical casuists who forbid to cut butter and meat with the same knife. And what makes the confusion of thought in *Woodleigh Park* more complete is that the author, heartily contemptuous of all opinions save her own, reserves what she thinks her most scathing sarcasm for the insane superstition and folly of the ceremony of professing and enclosing a cloistered Roman Catholic nun, entirely failing to see that the strict conventual ideal is quite at one with her own in desiring to separate its votaries from all worldly society and amusements, only that it has the merit, lacking in her and hers, of being thorough and consistent. There was a biography of Dr. Marsh, an Evangelical clergyman very much esteemed and admired for his exceptional piety, published a few years back. A cynical journal made a criticism which was strictly true, that the only marked events in an otherwise undistinguished life were his frequent transfers from one rich benefice to another richer and easier, and the fact that he never seems for an instant to have hesitated to leave one flock, whatever his professed interest in it might have been, when a better-endowed incumbency offered. No doubt some explanation may be given of this peculiarity; but to mere outsiders it looks more worldly than being present at a regatta, and perhaps even than the blacker criminality of going to see *Hamlet* or *Othello*: though a new variety of servant-galism has come to our knowledge within the last few days; warning having been given by an Evangelical housemaid to her mistress, because one of the sons of the family went one evening to a theatre. There are, however, some graver faults in the book than those of inconsistency and the Pharisaism which will not suffer even its skirts to be casually touched by others. In the very first chapter the husband of the model Evangelical lady of the story escorts her young sister to her first ball, leaving the wife alone with her little girl of six, who naturally asks why her mother has not gone with papa and auntie. She is immediately told that the reason is because mamma knows that it is sinful, but that unfortunately papa and aunt have not been so well taught what the Bible says, and that it is to be hoped they will soon be wiser. Whereupon the little damsel volunteers a pledge never to go to such naughty things, which her mother accepts. It is superfluous to dwell on the sheer unwholesomeness of training a baby to sit in judgment in this fashion on those whose conduct and motives it is quite incapable of estimating aright, but to whom it owes respect and duty. But we come upon something worse towards the close of the book, where a very young, innocent, and lighthearted girl goes to another ball, catches a chill, and dies suddenly as a judgment, with a very clear hint from the author that she has consequently passed into everlasting misery.

And yet Miss France marvels that every one is not ready to accept her creed and standard.

The White Cross and Dove of Pearls is also an Evangelical story, in which the same general views as to amusements and Sabbatharian observance are put forward as in *Woodleigh Park*, but in a very different spirit from the arrogant Pharisaism of that book. There is a fair amount of narrative power exhibited in it, though not much skill in weaving a plot, nor familiarity with the ways of society; but there is also some faculty for drawing female types of character, though there is no individuality about the men; yet it is very much too diffuse. The author would have made a much better book by resolute compression into less than half the actual bulk, and that mainly by cutting down long explanations of moods and motives, which more skilful treatment would have left to be inferred from the words and actions of the characters. There is culture and taste enough displayed to make it probable that, if terseness and point were added, the writer would earn popularity in her sphere. An error of reference occurs in one place, which needs correction. Cowper is credited with a very graceful and vigorous rendering of one of M^{me}. de Guyon's religious poems. It is, in truth, not among his versions, but may be found in her biography by Prof. Upham, of Bowdoin College, and is presumably from his pen.

Mercy Philbrick's Choice is a New England story of a very peculiar kind, altogether unlike the insights which Mrs. Stowe, Miss Phelps, Miss Alcott, the Misses Warner, Mrs. Whitney, and Mr. Bayard Taylor have given us into the life of the old Puritan stronghold. There is something more of Dr. Wendell Holmes about it, at least in his *Guardian Angel*, but, curiously enough, the book which it most readily brings to mind is one altogether dissimilar in tone and execution, Colonel Higginson's *Malbone*. There is absolutely no point of contact between the two, and yet whoever reads one, no matter which, and then lights on the other, can fail to have his former experience recalled. There is scarcely what can be called a plot, and the two or three situations in the book, though sharply and cleverly conceived, are not strongly dramatic. It is chiefly noteworthy as a study of character, specially of a type of female character almost peculiar to the United States, and best exemplified there by Margaret Fuller Ossoli and Maria dell' Occidente (Maria Gowen Brooks), as viewed from the standpoint of a Bostonian transcendentalist who has at one time had a severe attack of Theodore Parker on the brain, but has partly got over it. The writer has almost as keen an eye for the ugly and grotesque side of New England as Hawthorne has for its weirdness, and Mrs. Stowe for its homeliness; and has also exhibited a good deal of skill in the delineation of the heroine, save in two points. One is that, being a very young widow, suddenly bereft of a deeply-loved husband, she transfers her blighted affections almost as rapidly as the famous Ephesian mourner, with no seemingly adequate opportunity or inducement, which is quite out of keeping with the masculine fibre and constancy of character attributed

to her. The other fault is that she is described as a poet of rare and lofty gifts, and the author is indiscreet enough to give several specimens. They are not trash, far from it, nor are they altogether weak; but they are essentially imitative, and there is not any very keen sense of music displayed. They would probably never have been written if Walter Savage Landor and Mrs. Browning had not written first, and there are one or two stanzas after Shelley—a very long way after. One of the oddest things in the very queer theosophic ideas of Mrs. Philbrick, as set forth by her biographer, is that, after she has broken with her betrothed for a perfectly adequate reason, she settles with herself that she will be married somehow in a future state to an old minister whom she had rejected, but come afterwards to prefer just as he died; not taking into account that perhaps the late Mr. Philbrick, when rejoined, might not quite see it, nor yet the late Mrs. Dorrance, whom Parson Dorrance had passionately loved. This sort of speculation is rather beyond us; but no doubt an American heaven must have peculiar institutions adapted to post-Semitic beliefs.

R. F. LITTLEDALE.

CURRENT LITERATURE.

A Popular History of the United States. By William Cullen Bryant and Sydney Howard Gay. Vol. I. (Sampson Low and Co.) It would be manifestly unfair to pronounce judgment upon a serial work so important as this from an examination of only the initial portion of it. Both Mr. Bryant and Mr. Gay have yet their reputations as historians to make. The facts that the former has long ranked as one of the first of American poets and been for fifty years the editor of a daily political journal, and that the latter has been for some time his confidential assistant in his editorial capacity, give no assurance that either is specially qualified for the task upon which they have entered. There is no doubt, however, that the experience of Mr. Bryant, during his half-century of journalistic life, must be immensely valuable so far as that period of the history of the United States is concerned, and there is perhaps no American living whose narrative of its events would be more thoroughly trusted. It may be safely assumed, considering that Mr. Bryant is now in his eighty-second year, that the real responsibility of the work rests with Mr. Gay, who is, in this country at least, an unknown man. We prefer, therefore, to await the appearance of the later portions of the History before pronouncing upon its merits, especially as the present volume deals mainly with prehistoric America and the so-called "pre-Columbian" period, and ends with the mere establishment of the earliest English settlements. So far the authors have presented a rapid but most entertaining summary of what is known or conjectured respecting the Western Continent down to the commencement of the seventeenth century, and it is only just to say that their beginning promises well; but the real history of the United States is yet to come. We have Mr. Bryant's positive assurance that the work is to be entirely free from any sectional bias; that American shortcomings and defects, or, as he plainly says, "national sins and wrongs," will not be passed over; and that the story of the great nation shall be told without partiality, without passion, and with perfect candour.

De l'Italie. Essais de Critique et d'Histoire. Par Emile Gebhart. (Paris: Hachette.) This collection of essays seems to be the contents of a note-book, strung together without much con-

nected purpose. It bears few marks of originality, either in the choice of subjects or in the method of treating them. It contains scarcely any idea which may not be found in the works of Michelet, Quinet, and Zeller. The essays deal almost entirely with the period of the Renaissance, of which M. Gebhart tells us he has been a student for the last fifteen years, and about which he hopes to write a large work in time. We can only say that the results of fifteen years of study have been very carefully hidden away in the present book, so as not to interfere with the interest of the larger work that is to come. There is only one mark of novelty in M. Gebhart's treatment of the Renaissance. He discovers the original type of its social side in the life of the Romans at Pompeii, and of its ideas in the beliefs of Epicurus. After dealing pleasantly enough with these he passes on to Dante, Savonarola, Michel Angelo, the Florentine historians, and Raphael. As a critic we can say little for M. Gebhart. The mental condition of Dante during the period recorded in the *Vita Nuova* is characterised in a way which would express the views of the commonplace Philistine: "Il vécut sept années sur le bord de la folie." Similarly the characteristic traits of Macchiavelli's life in exile are dismissed as showing "navrante vulgarité." Nor is M. Gebhart more happy in his artistic criticism. The following remarks on Lionardo are certainly not profound: "S'il ne connut jamais l'élan mystique de Fra Angelico, la suavité religieuse de Raphael, la sublimité biblique de Michel-Ange, du moins fut-il toujours, par la bonté de son cœur comme par la noblesse de son esprit, au premier rang parmi les maîtres de l'idéalisme." Yet M. Gebhart is not deficient in dogmatism. After speaking of Fra Angelico's school, he goes on to say: "Les deux ouvrages supérieurs de cette tradition sont peut-être l'*Ecce Homo* du Sodoma, et la *Déposition de Croix* du Pérugin." This may be so; but we should like a little more explanation of the view of art which classifies Sodoma and Fra Angelico together. The very interesting picture of the martyrdom of Savonarola, in San Marco at Florence, is put down by M. Gebhart in a note to Pollaiuolo, without any explanation of the reason. The last essay in the book is on Giacomo Leopardi, in whom M. Gebhart finds the antitype to the scepticism of the Romans under the Empire, and whom he also treats as a symbol of the development of modern Italy. He ends with one of those meaningless generalisations so common among French writers: "Douter et aimer, telle fut la destinée de Giacomo Leopardi et la vocation de l'Italie."

The Church Bells of Somerset. By the Rev. Henry Thomas Ellacombe, M.A. (Exeter: Pollard.) Mr. Ellacombe is well known as an enthusiastic student of bells and bell-literature. The present account of the church bells of Somersetshire has been compiled by him, not from personal inspection, but from returns furnished to him by the clergy and others interested in such matters, to whom the author forwarded circulars asking for information. No pains seem to have been spared to make the book as full and accurate as possible. We are bound to say that as far as we have been able to test it, it is singularly free from error. The plates given of bell-stamps and the letters used in the older inscriptions are well executed. The jingles with which the Mediaeval bells are ornamented are always quaint and interesting. Sometimes they are really pretty; but their Latin is usually of a sort calculated to affright the modern schoolmaster. Modern bell-legends are commonly in the English tongue: some of them are as barbarous specimens of it as can be found. The advertisements of rural auctioneers alone equal them in ignorant stupidity.

"Me melior vere non est campana sub ere,"

one of the mottoes used by Robert Norton, an Exeter bell-founder in the reign of Henry VI., is neither poetical nor in very good taste; but how far removed it is in feeling from an inscription

used in 1804 by Thomas Mears, of London, for a bell in the church tower of Baltonsborough:—

"When men in Hymen's bonds unite,
Our merry peals produce delight;
But when death goes his dreary rounds,
We send forth sad and solemn sounds."

Bell-legends have not improved much during the last seventy years. We could give very modern examples which are quite as foolish and tasteless as the above. The latter pages of the book are taken up by what its author calls an *olla podrida*, that is, a collection of disconnected facts concerning bells and their belongings. Some of the things garnered here are hardly worth the good paper and type by means of which they are preserved, but for others we are not a little thankful. The engraving of the thirteenth-century sacring bell preserved at Rheims is an excellent woodcut, and a useful memorandum of one of the most beautiful small Mediaeval bells in existence.

The Lowndes of South Carolina. An Historical and Genealogical Memoir. By George B. Chase. (Boston: Williams and Co.) The love of the more cultivated among the citizens of the United States for pedigree-lore is proved by the multitude of genealogical memoirs and family histories which issue yearly from the American press. Mr. Chase is one of the most accomplished genealogists in the country, and he has evidently, in this History of the Lowndes family, done his best to arrive at the exact truth, and to put that truth before his readers in the clearest and most compact manner. The pedigree-maker, like the poet, is born, not made. No one, unless he loved such investigations for themselves, could be found to go through the long-continued drudgery of compiling an elaborate genealogical table. As far as we can test the book before us, the facts given are accurate, the accounts given of the two or three members of the family who were connected with the general history of the country are well put together—that is, short, exact, and modest. The Lowndes of South Carolina have been what would be called in this country an old county family. Originally from Cheshire, they arrived in America by way of Saint Kitts, and seem at once to have taken up a high position in their adopted country. The most distinguished member the race has produced was William Lowndes. He was a leading Southern politician in the days of Clay, Webster, and Calhoun. Had not an early death cut short his labours, it is probable that his name would now have been familiar to all who take interest in American politics.

Handbook to the County of Kent. By G. Phillips Bevan, F.G.S. With Maps and Plans. (Stanford.) One is so accustomed to bad guide-books that the worth of books of this description is not realised until one meets with a careful compilation such as that which Mr. Bevan has produced. It is not an easy matter to write a handbook which is at once copious and portable, and accurate as well as interesting; but this book satisfies, fairly well, all these particulars. It opens with a short account of the geological formation of the "Garden of England," which is useful enough; but the outline of the history of the county which follows is so brief and deficient as to be of little use to anyone. The author runs hastily through the very earliest period of Kentish history, touches on the Saxon period, and then winds up with a notice of the murder of Thomas Becket, which "shocked all England and the ecclesiastical world generally." The much-vexed question of the spot of Caesar's landing is touched on, but no attempt is made to solve it. May not Caesar have landed at Deal, as seems most probable, or rather some miles to the eastward of Deal, on what would have then been a wide expanse of low-lying land, but which is now the Goodwin Sands? Earl Goodwin's estate was not overflowed by the sea till the beginning of the twelfth century. For the purposes of the tourist the book is divided into three parts, severally devoted to

twelve railway excursions, one steamboat excursion, and twelve excursions by road. It is a pity greater preponderance was not given to the road, but otherwise the routes are well chosen. The information, too, is, with very few exceptions, of the fullest kind, and is carried so far down to the present time that even the spot of the projected Channel Tunnel is pointed out. More care might have been given to the explanation of names of places. It is useless to remark that "the tourist will notice the frequent termination of the word 'bourne' to the villages" without telling the tourist what "bourne" signifies. Very little fault can be found with the architectural descriptions of churches and other buildings. The author is here thoroughly accurate, and gives the most detailed accounts of everything worthy of note. He might, perhaps, have added, in describing Malling, that the keep there is probably the earliest Norman keep extant, and some mention should have been made of such a curiosity as Ightham Moat House. The refectory, too, of St. Martin's Priory at Dover is of Norman rather than of Early English architecture. The style of the book is above that of most guide-books, but more discrimination might have been used in the choice of epithets. Views are almost always described either as "unique," "curious," or "peculiar." The map of Kent is accurate, and gives all necessary information, and there are plans of Rochester and Canterbury Cathedrals. Mr. Bevan's *Handbook* may be safely recommended as a very pleasant companion to all who may chance to travel through Kent, and as a very useful guide to the lovers of ancient architecture.

Some Observations on the Anglo-Saxon Christian Name. By Henry Charles Coote, F.S.A. The object of the author of this paper is to show that the single names by which Anglo-Saxons were known to history were not the only names they bore in Christian times. It is true that he can only adduce two undoubted examples of a Christian name—King Ceadwealla, who was baptised as Peter, and Biscop Benedict, Abbot of Jarrow—but he considers these as expressing the general law applicable to all Englishmen. Mr. Coote lays great stress, and justly so, on the heathen character of Anglo-Saxon names, and the impossibility of their having been conferred at the sacrament of baptism in opposition to the universal custom of the Church, which forbade the use of names unconnected with Christianity. It is only natural that the native *nomen* conferred on the child at birth should have been used throughout life in preference to a foreign, and to a Saxon uncouth, *cognomen*, but it is strange that Mr. Coote's research has only discovered two instances of the use of both. A further argument in favour of this view is supplied by the fact that until Protestantism threw off the old restrictions in the use of Christian names the Anglo-Saxon names are found occurring in England merely as surnames, except in cases like Edward or Edgar, previous bearers of which had been canonised. On the whole, Mr. Coote has fairly succeeded in showing his opinion to be "probable," as the Jesuit moralists would have said, and the evidence at his command hardly admits of his doing more.

Within Bohemia; or, Love in London. By H. Curwen. (Remington and Co.) The lives and loves of artists whose pictures no one buys, and of poets whose verses no one prints, not to say pays for, have been described till one is weary of the word Bohemia. Mr. Curwen, however, reveals some more secrets of the land "whose latitude is rather uncertain, and longitude possibly vague." The result does not make us share Prowse's pity for the people who knew not the city of Prague. Within Bohemia young men loaf about the suburbs, and ask girls for kisses and cake, or discuss the history of their existence. There is a certain force in the story of the "Eldest Sister," who loved, and nearly ran away with, her sister's husband; but then what a portentous and unre-

deemed cad was the husband! This interesting creature was a City man, who quoted Slavonic poetry, made 200,000*l.* by one speculative *coup*, and spent half of it in "six months' devilry or pleasure, which you will, among my dear old Bohemian chums." After the cad's return, the Eldest Sister became "sick, almost to inanition, with ennui," and readily unfolded the tale of her woes to a chance scribbler whom she met in the rural suburbs. The tale of a "Plain Woman" reveals unfathomable depths of Bohemian bad manners, and the "Mystery of Malcolm Mackinnon" is a failure in the style of Poe's "William Wilson." "Hard Up" is much pleasanter and more interesting, but the general effect of the volume is that of immaturity. Mr. Curwen's cleverness is quite undeniable, and with all its faults of taste his book has more character and style than the ordinary novel. Balzac, he may remember, tried hard for many years before he made a step in the direction of *La Comédie Humaine*, a work some parts of which Mr. Curwen modestly expresses his wish to imitate.

NOTES AND NEWS.

PROF. PAULI is at present on a visit to this country with the intention of concerting arrangements with Prof. Stubbs for the compilation of a volume of the *Monumenta Germaniae Historica*, which is to contain extracts from English Mediaeval writers relating to Germany.

MESSRS. LONGMANS announce *Selections from the Writings of Lord Macaulay*, by G. O. Trevelyan; *The Life of R. Frampton, D.D.*, by the Rev. T. S. Evans; *G. E. Lessing*, by Helen Zimmern; *Memorials of the Discovery and Early Settlement of the Bermudas*, by Major-General Lefroy; *Democracy in Europe*, by Sir T. Erskine May; *The Official Baronage of England*, by J. E. Doyle; *The Puzzle of Life and How it has been Put Together*, by A. Nicols; *A Short History of Latin Classical Literature*, by G. A. Simcox.

PROF. MONIER WILLIAMS sails for India again on the 12th of this month. He is writing a work on the religious systems and sacred places of India, to complete which it is necessary for him to make a tour in the Madras Presidency. He wishes also to collect MSS., books, and objects illustrating the religions of India, for the Indian Institute to be founded at Oxford.

A COMMITTEE has been formed for collecting subscriptions towards a fund which shall serve at once as a testimonial of public respect to the memory of the late Mr. George Smith and as a means of assisting the large family he has left behind him. Contributions will be received by J. W. Bosanquet, Esq., 73 Lombard Street, E.C., in the name of Sir Henry Rawlinson and Dr. Birch.

GENERAL DI CESNOLA, who is residing in London at present, is engaged upon a work on the History and Antiquities of Cyprus. A chapter upon the relations between Egypt and Cyprus will be contributed by Dr. Birch. The discoveries made of late years in Cyprus, to a great extent by General di Cesnola himself, have rendered Engel's *Kypros* altogether obsolete, and the forthcoming volume will be exceptionally valuable.

MESSRS. FREDERICK WARNE and Co.'s list of new books includes a volume by G. Christopher Davies, entitled *The Swan and her Crew*; Pope's Poetical Works; *Maidenhood; or, The Verge of the Stream*, by L. Valentine; *Seventeen to Twenty-One*, by M. M. Bell; *The Home Book for Young Ladies*; *Aunt Louisa's London Favorite*; *Aunt Louisa's Choice Present*; and a gift-book for girls and boys, entitled *St. Nicholas*.

MESSRS. LONGMANS have reprinted, in the form of a pamphlet, Samuel Brett's *Narrative of the Proceedings of a Great Council of the Jews, Assembled in the Plain of Ageda, in Hungary, about Thirty Leagues distant from Buda, to*

Examina the Scriptures concerning Christ, on the 12th of October, 1650. It has been already reprinted more than once in various collections.

MR. HENRY SWEET, the President of the Philological Society, has been appointed Examiner in Anglo-Saxon for the degree of Doctor of Literature in the University of London.

WE are informed, with reference to a statement in the last number of the ACADEMY that Mr. Rossetti's edition of Shelley is not in the British Museum, that the copy stolen from the Reading Room has now for some time been replaced, and may be consulted by any visitor.

MESSRS. CHURCHILL announce *A Manual of the Anatomy of Invertebrate Animals*, by Prof. Huxley; *Public Health*, by the late E. A. Parkes, M.D., F.R.S., revised by William Aitken, M.D., F.R.S.; *Lectures on Medical Jurisprudence*, by Francis Ogston, M.D., and Francis Ogston, jun., M.D.; *A Handy Book of Forensic Medicine and Toxicology*, by W. Bathurst Woodman, M.D. St. And., M.R.C.P., and C. Meymott Tidy, M.A., M.B.; *On the Detection of Adulteration in Food and Drugs by Chemical Analysis and the Microscope*, by Thomas Stevenson, M.D., &c.

A NEW work by Prof. T. R. Birks, on *Modern Physical Fatalism, and the Doctrine of Evolution*, including an examination of Mr. Herbert Spencer's *First Principles*, will be published shortly by Messrs. Macmillan and Co., who will issue at the same time a second and enlarged edition of the same author's *Difficulties of Belief*.

WE are glad to learn that Messrs. Macmillan and Co. will publish this autumn a new and cheaper edition of Macready's *Reminiscences*, with selections from his diaries and letters, a work which excited much interest on its first appearance two years ago. The new book will be published in one volume at 6s.

AMONG the papers to be read during the coming session of the Manchester Literary Club are:—"Gypsy Life in Lancashire and Cheshire," by H. T. Crofton; "Art and Social Science," by W. H. J. Traice; "John Keble: his College and Chapel," by John Evans; "Browning's Ballad of Childe Roland," by the Rev. W. A. O'Connor; "Mission of Art and Artists," by W. Tomlinson; "A Moorland Student," by Edwin Waugh; "Ancient Battlefields of Lancashire, No. 3: Battles in the Valley of the Ribble, near Whalley and Clitheroe," by C. Hardwick; "Lancashire Mathematicians," by Morgan Brierley; "Some Manchester Theatrical Reminiscences," by John Evans.

A *History and Antiquities of Morley*, co. York, has been written by Mr. William Smith, of that place, and recently published by Messrs. Longmans. The work is well compiled and well illustrated by photographs, &c.; its interest, however, is almost purely local, and we can find no space for a more extended notice of it.

MR. SERJEANT COX has in the press a treatise on *The Principles of Punishment, and their Practical Application in the Administration of the Criminal Law*.

THE following scientific works will be published during the coming season by Messrs. Macmillan and Co. The fourth volume of Dr. Russell Reynolds's *System of Medicine*, dealing with the various forms of heart-disease; the second volume of *Elements of Physical Manipulation*, by Mr. E. C. Pickering, Thayer Professor of Physics in the Institute of Technology in Massachusetts; a translation of Guillemin's *Applications of Physical Forces*, by Mrs. Lockyer, edited by Mr. J. Norman Lockyer, F.R.S.; and a treatise on *Astronomical Myths*, based on Flammarion's *The Heavens*, by Mr. J. F. Blake.

MESSRS. ALLEN AND Co. will issue during the season a new and thoroughly revised edition of Starling's *Indian Criminal Law and Procedure*; also a new and revised edition of Döllinger's *First*

Age of the Church, translated by the Rev. H. N. Oxenham. They have also in preparation a *Manual of the Persian Language*, based on Forbes's *Hindustani Manual*, the author being Captain H. Wilberforce Clarke, of the Royal Engineers.

MESSRS. BEMROSE AND SONS will shortly publish *Uncle Tom's Story of his Life*: an autobiography of Josiah Henson (Mrs. Beecher Stowe's "Uncle Tom"); and the second volume of Mr. J. Charles Cox's *Notes on the Churches of Derbyshire*, dealing with the hundreds of High Peak and Wirksworth.

As the popular double-columned editions of Ben Jonson and Webster do not notice an ascertained date with regard to a play in each, we advise possessors of them to note in their copies that Mr. Rawdon Brown's MS. translation of "Diaries and Despatches of the Venetian Embassy at the Court of King James I. in the years 1617, 1618," reviewed in the *Quarterly* for October, 1857, says that Ben Jonson's masque, *Pleasure Reconciled to Virtue*, was performed before James I. at the fête held in the Banqueting House (which he built in 1606) on Twelfth Night, 1617-18; and that Busino (the Secretary) certainly saw Webster's *Duchess of Malfy* acted in 1618, for, while complaining of the irreverence with which the Romish clergy are treated on the Protestant stage, he gives an account of the part "of a certain cardinal," which can refer only to the plot of the *Duchess of Malfy*.

It will be learned with regret that the French geographical journal *L'Explorateur* has proved so great a financial failure that the geographers who created it have resolved that it cannot go on; the more so as during its short five months of life it has gained a most respectable stamp of merit and originality.

THE last three numbers of the *Journal des Economistes*, all published very late in the month, have contained several articles of interest, among which we may refer to M. de Fontpertuis's essay in the July number, on "Socialisme, Christianisme, Néo-Catholicisme, Economie Politique." But the article likely to attract most attention is by M. Maurice Block, in the August number, on "Les Deux Ecoles Economiques," directed against the new historical school of economists, of which Roscher, Hildebrand, Knies, and Schmoller in Germany, Cliffe Leslie in England, and Luzzati in Italy, are taken by M. Block as the chief representatives. M. Block had on several previous occasions assailed the German Kathedersocialisten, so-called, with considerable acrimony; and although the present article, which embodies the substance of a memoir recently read before the French Academy, is moderate in language and tone, it cannot be accepted as a fair representation of the doctrines of the advocates of the historical method. M. Block misconceives the drift of some of the works he refers to, and is far astray in lumping together all the economists of the historical school as having common practical aims. There are among them young men and old, Radicals and Conservatives, enthusiasts and sceptics; and they are no more all agreed respecting the proper sphere of the State than all the members of the Anglican Church are about the authority of the clergy.

THE September number of the *Journal des Economistes* contains an article by M. Courcelle-Seneuil, a French economist of distinction, who last year showed a disposition to ally himself to the new school; but we notice in his article a reproduction of a fallacy of some of the text-books of the old school which we have more than once pointed out—namely, that the consumption of wealth imports its destruction. Consumption properly denotes in political economy simply the use of things produced, and a factory, a house, or a steam engine lasts longer for being used. As Senior observed, there is probably some iron in use at this day which was produced before the Norman Conquest.

DON A. DE PAZ Y MELIA gives an account in the *Revista de la Universidad de Madrid* of the exorcising of the locusts which in 1668 were ravaging the fields of Toledo to an extent that seemed to defy all human efforts. An immense procession was formed, the "miraculous standard" of St. Augustin was taken out, three masses were said at once upon a platform for the staying of the plague, and, still more important, the immense concourse filled baskets with 200 fanegas of the obnoxious insects, without counting the great quantities that were burned. Whether it was the pomp and circumstance with which the affair was conducted, or the activity displayed in the field-hunt, the result was satisfactory. The procedure was imitated by other places, but the documents to which Señor Paz y Melia has referred do not say whether the *Milagroso Estandarte* accompanied all these expeditions. Prof. de la Fuente sketches the Origin of the University of Lerida, founded in 1300. The constitution includes the following paragraph:—

"... statuimus quod nullus phisicus, poeta, grammaticus vel artista, exceptis pueris qui nondum aetatis suae annum xiiii dissimiliter exegerunt, in festivitibus Sancti Nicholay et Sanctae Katerinae praesumant tripudiare sive ballare per civitatem vel ludos facere inhonestos, vel alias velati concedere cum habitu Judeorum vel Sarracenorum"

DON F. JAVIER SIMONET writes on the subject of the Condition of Women in Spain under the Arabs. The freedom and learning of the ladies during that domination has no parallel among the Mohammedan peoples. Señor Simonet finds the explanation in the influence of Christianity. The conquerors sought for wives among the native ladies, whose education and intelligence gave them greater charms than those possessed by the abject inmates of the harem. Those who espoused Mohammedan husbands usually stipulated for a degree of freedom which would not have been accorded to women of the other race. Some were even allowed to bring up their children in the Catholic faith. Señor Simonet rightly lays considerable stress upon the fact that many of the illustrious ladies were Christians or of Christian extraction. Some, as Mosada, the poetess of Grenada, belonged to families which had renounced the national faith and embraced Islamism. Fatima bent Zacaria is only one of several examples who, from choice, refused to enter the marriage state, a thing certainly opposed to Moslem ideas. Señor Simonet makes some good points, but it is necessary to remember his standpoint, which is amusingly shown by his reference to "the great decadence of Christian Europe, infested for three centuries by Protestantism and Rationalism." Mr. G. Macpherson discusses, in connexion with the recent advances in our knowledge of the prehistoric period, the question of the primitive inhabitants of Spain.

THE *Archivio Storico* contains an article by Signor Rocchi on Pompeo Neri, one of the great men who did much to raise the condition of Tuscany under the first two Grand Dukes of the house of Lorraine. There is also an interesting investigation, by Signor Ricciardi, of the proceedings of King Joachim Murat in Calabria. The Italian archives are being searched in various directions. The Record Office has obtained permission to examine the Vatican archives for documents relating to the history of England. The French Government has sent M. Mollard to search the archives of Turin and Genoa for documents bearing on the history of France. M. Zeller has also been exploring the archives of Florence for documents which throw light on Henry IV. and Mary de' Medici.

THE *Nuova Antologia* for September contains a long letter from Herr von Gebler on the trial of Galileo. It is in answer to a letter addressed to him in the appendix of Signor Berti's *Processo Originale di Galileo Galilei*. Herr von Gebler, in his *Galileo Galilei und die Römische Curie*,

follows those who think that the Roman Court falsified documents for the sake of being able in 1633 to condemn Galileo with an appearance of justice. Signor Berti doubts this, and Herr von Gebler now defends his position at great length.

We have received *A Plain and Easy Account of British Fungi*, by M. C. Cooke, third edition (Hardwicke and Bogue); *A Treatise on Lathes and Turning*, by H. Northcott, second edition (Longmans); *Spiritualism*, Prize Essays (E. W. Allen); *Hygeia: a City of Health*, by B. W. Richardson (Macmillan); *Man, considered Socially and Morally*, by G. Sparkes, second edition (Longmans); Bentham's *Introduction to the Principles of Morals and Legislation* (Clarendon Press); *The Irish Ecclesiastical Record*, vol. xi. (Dublin: Kelly); *Geschichte der Italienischen Malerei*, von J. A. Crowe und G. B. Cavalcaselle, deutsche original-Ausgabe, besorgt v. Dr. Max Jordan, 6. Bd. (Leipzig: Hirzel).

OBITUARY.

LAWRENCE, George, at Edinburgh, aged 49. [Author of *Guy Livingstone*, &c.]
 MARRYAT, Joseph, Sept. 24, aged 85.
 RIMBAULT, Dr. E. F., in London, Sept. 26, aged 60.

NOTES OF TRAVEL.

THE Dutch Geographical Society is making active preparations for the despatch of the expedition which is to explore the interior of Sumatra. One portion will confine its attention to the Djambi territory, while the other will undertake the examination of the Korintji valley and other parts of the island. It is hoped that the expedition will be able to start in about three months' time.

ACCORDING to a telegram received at Gothenburg from Prof. Nordenskjöld, his expedition, as far as the seventy-first parallel of N. lat., on the Yenisei had been attended with complete success. He considers that the navigation of the river may now be regarded as practicably established, and reports that in addition to the acquisition of various interesting collections of fossil animal remains, and the determination of numerous points bearing upon meteorological, hydrographic, and other kindred scientific questions, he has to make known the discovery of a new island, about fifty versts in length, which is situated at the mouth of the Yenisei in 73° N. lat. The only contretemps of the expedition had been the continued absence of news (up to September 18) of the Swedish botanist Dr Theel and his party, for whom he had waited for sixteen days at the most northern point on the Yenisei to which the river-steamers could ascend. Almost simultaneously with Professor Nordenskjöld's telegram from Hammarfest a letter reached Gothenburg, dated July 18, from Turukansk, in 66° 30' N. lat., which Theel's expedition had left two days earlier. As Turukansk is only about 280 miles distant from the point on the Yenisei at which Professor Nordenskjöld and his colleagues awaited their arrival until September 2, there seems reason to apprehend that some obstacles must have presented themselves during the month of August, by which Theel and his party were detained on their return route. Professor Nordenskjöld, who states that he had found the Kara Sea free from ice between September 2 and 7, expresses himself with perfect assurance in regard to the practicability of maintaining trade communications between different parts of the Kara and Yenisei. In conclusion, he announces that he has deposited the samples of goods entrusted to his care at Karapowski, from which they may be easily fetched by steamers in the course of next summer.

THE *Colorado Springs Gazette* of August 19 states that the members of the U. S. Geological and Geographical Survey of the Territories, Dr. F. V. Hayden in charge, were expected to be in the field within a few days. The expedition for

1876 has been organised as follows:—Prof. F. V. Hayden, geologist, in charge; Capt. James Stevenson, executive officer; Dr. Elliott Cowes, secretary, in charge of natural history department. The first division will be composed of A. D. Wilson, topographer in charge; F. M. Endlich, geologist, and Wm. Atkinson, topographer. It is designed that this division shall complete the exploration of a small portion of Colorado lying near the Utah line; then move northward on the west side of the Rocky Mountains and join forces with the division which will begin operations in the neighbourhood of the White River Agency. The second division will consist of Henry Garnett, topographer, in charge; Dr. A. C. Peale, geologist; Robert Adams, assistant; James Stevenson, executive officer. This division will proceed to a region known as Sierra la Sal, from which a portion of the expedition was driven last year by a band of Indians composed of renegade Utes and Navajoes, and which in consequence was left without examination. The third division will have G. R. Bechler, topographer, in charge, assisted by a geologist and mineralogist. This division will make its way through the Middle Park, commencing its labours at the western rim of this park, working along the north-western part of Colorado, joining with Clarence King's survey of the 40th parallel. The fourth division will be placed under the charge of Dr. Elliott Cowes, with an assistant in natural history. This division will be devoted to zoological research. It will not be confined to any particular locality, but will traverse the entire mountainous portions of the country, making collections of birds, animals, shells, plants, and insects, studying the habits and determining the geographical distribution of all forms of animal and vegetable life. Dr. Hayden will take an assistant and make an extended tour over a greater portion of the entire country in order to summarise the labours of the survey for the last three years in Colorado. It is the intention to complete the survey of Colorado this year.

FROM some official correspondence relating to the slave trade, recently printed by command of Parliament, we extract the following curious description of an African town and its surroundings, drawn up by Mr. F. Holmwood, assistant political agent at Zanzibar:—

"Brava is a town of about 4,500 inhabitants, nearly four-fifths of whom are Somalis and their domestic slaves, the remainder are principally 'Mbalazi'—the original Swaheli-speaking inhabitants of the place—subdued by the Somalis. The Arab population is about fifty. Three or four Mohammedan Indians, British subjects, reside there during the shipping seasons, and one European has lived there for about six years. Banians (Hindoos) have tried in vain to settle. They have been universally insulted and threatened by the Somalis, who are bigoted Moslems.

"There are about fifty stone houses in the town, scattered here and there, but the majority of the people live in huts with stick frames plastered with mud and cow-dung; and there being no fort, and only the remains of an old wall round the town, it is quite at the mercy of the predatory tribes which surround it at a distance of about twenty miles. These tribes have long levied blackmail upon the town, and increased their demands with the increasing prosperity of the people."

PARIS LETTER.

Paris: Sept. 30, 1876.

We are still indebted to the dead for our literary novelties. Pending the appearance of Balzac's Correspondence, we have some fragments of the *Life of Napoleon* by Stendhal, edited by M. Colomb (O. Lévy). It had long been known that Henri Beyle—such was the real name of the character who styled himself M. de Stendhal—left a MS. entitled a *Life of Napoleon*, but this MS. was, according to report, absolutely illegible, and the alleged work was looked upon as a final hoax by the great master of literary mystification. It appears, however, that it has been found possible to partially decipher his hieroglyphics, and hence the fragments which are now presented to the public. Beyle was in one or other of Napoleon's armies from 1805 to 1815; he had a close view of the Consul and the Emperor, and the majority of those who served under him; he made a large collection of characteristic anecdotes, and, with his sceptical and wholly unbiassed intellect, he was the very man to give us a life-like portrait of that extraordinary and incomprehensible personality. Unfortunately the volume which has just been published only reaches as far as the close of the campaign of 1797, in which Beyle did not take part, and the accounts of battles and strategic movements with which it is mainly filled are often wanting in clearness and interest. Stendhal's strong point was detail, and comprehensive views are beyond him. The account of the Battle of Waterloo with which *La Chartreuse de Parme* opens is a master-piece; it is like the corner of a picture, like an epic seen through the small end of the opera-glass; but in dealing with the campaign of 1797 he falls far short of M. Thiers; he multiplies petty facts without ever combining them into a connected whole; he continually repeats himself, explains, demonstrates, and despite all we cannot understand him. What constitutes the interest of the volume, what gives it a real literary and historical value, is in the first place the Introduction, one of the most witty productions that Stendhal has left us, the account of the childhood and youth of Napoleon, the portrait of his mother, Laetitia, and some anecdotes of undoubted authenticity which throw light on the character, bitter, ambitious, and domineering, yet noble and attractive, of the young General of the Republic. The details of the poverty of the army of Italy, its enthusiasm, its want of discipline, the eagerness with which officers and soldiers gave themselves up to love-intrigues in the very midst of a campaign the success of which was anything but certain, are also very curious. Briefly, this volume, without presenting the literary public with any very attractive reading, will furnish the historian and the moralist with an ample supply of characteristic facts hitherto unpublished. Although a passionate admirer of Napoleon (and also, by the way, of Danton and the members of the Convention), Stendhal does not seek to adorn his hero; he strives after sincerity before everything beside. "I take," he says, "four or five little facts, and instead of summing them up by a general phrase, into which I might introduce shades of falsehood, I reproduce those little facts." May we not here recognise the man who, little known in his lifetime, has since exercised such a great influence on contemporary literature, on Mérimée and Taine, as well as on Daudet and Feuillet?

M. Funck-Brentano is not a Stendhal—he has not the least horror of generalisations! He has just published a volume entitled *La Civilisation et ses Lois* (Plon), in which he attempts to determine the causes of the progress and decay of nations. M. Funck is a most curious personality. Born in Luxemburg, nurtured on the methods and the philosophy of Germany, and married to a niece of the famous Bettina Brentano, he has conceived a strong passion for France since her defeats. After the war of 1870 he became a naturalised Frenchman, and gave lectures on International Law at the Ecole Libres des Sciences

Politiques. One result of these lectures is a *Manual of the Law of Nations*, written in partnership with M. Albert Sorel, which will appear in January next. M. Funck began with the study of medicine, then went over to metaphysics, and wrote two works, a *History of Philosophy*, and a book on the *Human Sciences*, which have had but little notoriety, but in which curious enquirers have found some original thoughts and novel points of view. The book which he has just published is very superior in clearness of thought as well as in point of style. While preserving a distinctly German manner, M. Funck's talent has grown more supple and more French. His point of view in this essay of historical philosophy is the exact opposite of that of Buckle. The latter regarded the spirit of negation, of scepticism, as the starting-point of all progress; for M. Funck nations are progressive only during periods in which there is agreement and harmony between all the elements of social life, between manners and laws, between creeds and sciences, between capital and labour. The struggles which break out in the bosom of nations, or between one nation and another, are an effort to reach this harmony, and when it does not result nations degenerate. There is certainly much truth in this idea, and M. Funck, whose knowledge is encyclopaedic, supports it by a host of considerations, of original proofs, which are often startling even to paradox. Nevertheless, like all philosophers, he carries his system too far; the unity which is a condition of the normal development of individuals as well as of peoples may become oppressive, perhaps a cause of death; and a struggle, or even a revolt, is often necessary in order to break asunder antiquated forms and permit the creation of a new unity and harmony. So we regard as unjust M. Funck's criticisms of the Reformation and the Revolution, which he condemns without reserve; and we believe the wishes to be sterile and unphilosophical which he expresses in view of a reconciliation between the Catholic Church and the modern scientific movement. Catholicism can no longer be an element of life and harmony; it is one of those causes of strife and war which, in M. Funck's own opinion, must be eliminated to the end that order may reign. We regret also that, carried away doubtless by contemporary prejudices, M. Funck takes pleasure in minimising the part played by the Germanic races and exalting the Slavonic and Latin races beyond measure. This partiality deprives his opinions of much credit. In spite of these reserves, we think that his book deserves to be read and meditated upon; so rare are works vigorously thought-out in our days.

M. Zeller's *History of Germany* (Didier) is likewise marred by contemporary political prejudices. Nevertheless his third volume, dealing with Conrad II., Henry III., Henry IV., and Henry V., the first period of the great struggle between the priesthood and the Empire, is very superior to the two previous volumes. M. Zeller has a thorough knowledge of this period, and without possessing very great talents as a writer, he relates its history with a degree of spirit, passion, vivacity and dramatic power which renders his book very fascinating reading.

Now that all eyes are turned toward the East, books of travel or history which bring us acquainted with those countries, big for us with tempests and dangers of every kind, are welcome. So the public will read with pleasure the agreeable account by M. Melchior de Vogüé of Syria, Palestine, and Mount Athos (Plon), and especially the two volumes of M. Jurien de la Gravière on *La Station du Levant* (Plon). After having been one of our best naval officers, M. J. de la Gravière has become the accurate and competent historian of our fleet. He now gives us the history of the Greek campaign (1820-1831), events of interest at the present moment, and for France of melancholy interest, since they re-

call the time when the paramount influence in the East belonged to her.

M. Sayous likewise contributes in some measure to the subject which occupies all minds by publishing the first volume of his *Histoire Générale des Hongrois* (Didier). This work, to be complete in two volumes, is the fruit of long and conscientious studies. M. Sayous is one of the few European scholars who possess a perfect knowledge of the Hungarian language; he has spent some time in Hungary, and he has utilised for the purposes of his History all the original sources as well as works at second-hand. The Hungarians at the present day play a leading part in the events of the South of Europe; after having been the barrier of Europe against the Turks, they now find themselves by a strange fatality—the result of their geographical position—drawn toward them by the fear of common enemies. Nothing is more curious than to seize in the past the starting-point of the highly complicated situation of the present Empire of Austria.

Next to the Eastern question, the religious question is that in which the present generation of Frenchmen are most keenly interested. Clericalism has taken the first place in the thoughts of statesmen as well as of the public. I showed in my last letter the position occupied by Catholic writers in literature. Their opponents have recourse to the quarrels of the Restoration for weapons wherewith to assail them. The erection of a monument to Paul Louis Courier at Vézét was the occasion of an anti-clerical manifestation, and was followed by the publication of a charming edition of Courier's works, with a preface by M. Sarcey, the promoter of all this semi-literary semi-religious campaign (Jouaust). To tell the truth, Courier is rather a gloomy representative of free-thinking. He had more wit than character, and his pamphlets are charming exercises in a refined and delicate style rather than the expression of a strong and sincere conviction. If Courier were to return to life, he would find no dearth of subjects for his railery. M. Paul Parfait has just collected in a very curious little volume entitled *L'Arsenal de la Dévotion* (Librairie Illustrée) the grossest extravagances of contemporary Catholicism. It beats all imagination; expiring paganism as it is depicted for us by Lucian and Apuleius was more immoral but not more superstitious or absurd than the *cultus* of Lourdes or of La Salette. All Catholics, however, do not fall into excesses. M. Thureau-Daugin, who is an earnest Catholic, has just published two volumes on the Restoration, entitled *Royalistes et Républicains, et le Parti libéral* (Didier), which are not only works of rare literary talent, but also contain the most impartial judgment yet passed on that period of agitation.

The best method, after all, of attacking the superstitions and eccentricities of modern Catholicism is to show what was the original character of this Church, now so degenerate. The volume which M. de Pressensé is about to publish is from this point of view highly instructive—the fifth volume, namely, of his *Histoire des trois premiers Siècles de l'Eglise Chrétienne* (Sandoz et Fischbacher). It treats of the *cultus*, the ecclesiastical organisation, and the private life of the Christians in the third century. Never hitherto has so complete a picture been drawn of Christian life. The reader is enabled to be present at all the religious ceremonies, and follows all the phases of the liturgy. At the same time you see the birth of the ecclesiastical hierarchy and, with Pope Callistus, of those pretensions which will one day result in theocracy. M. de Pressensé brings to this study a warmth of heart and intellectual breadth which will gain credit for his book beyond the limits of the Protestant world.

Messrs. Germer-Ballière have just published a translation of Mr. Matthew Arnold's book, *Literature and Dogma*, executed under the author's own superintendence, and with considerable talent.

We are somewhat doubtful, however, whether questions of theology and Biblical exegesis excite very much interest in France. Here one is a believer or a sceptic for general reasons and *en bloc*. The details of theology—unfortunately, perhaps—do not possess much attraction for the French.

I will mention, in conclusion, a book by M. Alexandre Büchner, brother of the famous materialist and Professor of Foreign Literature at Caen, which has a peculiar interest for English readers. It is entitled *Les Derniers Critiques de Shakespeare* (Caen). M. Büchner analyses, and falls into the error of approving, the attacks recently made upon Shakspeare in Germany, on the part of certain critics desirous of making a reputation by causing a scandal. There is, however, something to be learnt even from these eccentricities—namely, that one must be on one's guard against excessive and absolute adorations, which inevitably provoke exaggerated reactions.

CORRESPONDENCE.

LAND'S HEBREW GRAMMAR.

Leiden: Sept. 24, 1876.

Professor W. Robertson Smith, in his article on my *Principles of Hebrew Grammar*, has remarked with reason that the book was written mainly for the sake of what he calls the formal and logical features of my exposition. It was my wish to make the fabric of the language more intelligible: to describe it not merely as a historical fact, to be admitted however it may puzzle our modern understanding, but as the joint produce of human thought and articulation, the analogue of our own. This I consider to be the object of Grammar as a science; and also the sole chance we have of getting some insight into the workings of the old Hebrew mind and the probable meaning of difficult texts. On the study of Hebrew, as it is mostly conducted, there always remains the stamp of the mediaeval Jewish mind, which is quite a different thing. In the case of a professed

philologist, long familiarity with the documents will counteract the disadvantages of a confused method, and tact supply the deficiencies of theory. But where, as usually, a limited time only can be devoted to Hebrew, the little experience we get becomes really useful only by rationalising it as thoroughly as we can. To acquire a smattering of the language, without either tact or theory, is but to gain a new subject for superficial discussion and sham scholarship. And the difficulties of more scientific grammar should hardly deter us when we reflect upon the mental labour required from every student of Sanskrit, mathematics, or natural science. Moreover, what seems difficult to scholars accustomed to other views may recommend itself as natural and easy to the fresh understanding of a beginner.

As to my vowel-theory I think the reviewer has not quite caught the main point. Of course I only treat of the Western pronunciation as embodied in our printed vowel-points. Now, I care very little how these may be sounded in our schools—national peculiarities of pronunciation will remain whatever we do—provided it be kept in view that the punctuators meant, by their vowel-points, to express nothing but quality. If it be advisable in teaching to give two different sounds to qomeç, as arising from *d* and from *û* respectively, the same reason holds good for hõlem, which may mean *d*, *û*, or *au*, or even for segól and çéré. The notation of qomeç hotup as hotép qomeç is certainly not in the spirit of the first Western punctuators, who intended the latter for a sort of indefinite-vowel, but an innovation introduced by their successors from another source. I am aware that there has always been a pronunciation of qomeç as *a*, and that this not improbably was pure *a*; but what I deny is, that it is represented in the Western system of punctuation, and should be admitted in a treatise proceeding from that system. In fact, the practice is, historically, a corruption of one channel of tradition by an element taken from another; pedagogically, a confusion, not carried out consistently, between the old and the new vocalisation. And even in the long run, it will be easiest to keep asunder what belongs to different ages. The writer in the *Athenæum* of Sept. 16 may rest assured that it never entered into my design to supersede the new vocalisation by the old one.

There is no doubt that there always remained a difference between longer and shorter pronunciation of vowels (cp. 42 n., 57 ff.). But so we find it, for instance, in Italian and French, without its being homologous to the old Latin quantity. Old quantity is only one of the complex causes of that modern difference. Meteg (explained in 42 n.) refers to the latter. The mistaken theories of Jewish grammarians are accounted for (Preface, p. xvii.) by their confounding the same with old quantity as preserved in Arabic.

"Dogésh lene" is constantly disregarded except where it is of some use, either as the sole outward distinction of forms (127 c), or as a warrant for their analysis (90 a, 206 c). Its principle is, as I think, sufficiently explained in sections 31 and 45. To mark aspiration and its opposite in reading out a text appears to me unnecessary trouble, nor is it commonly done in this country.*

The "obvious" objections to the recognition of case-endings alluded to in the *Athenæum* cannot be answered as long as they are not stated. If they are those of Renan and Nöldeke, they have received attention long ago; if new ones, it would be interesting to be acquainted with them. Also, to receive precise information as to the point at which reforms in Hebrew grammar ought to stop.

That Olshausen hesitated, or did not finish his treatise, there is no evidence. Official duties under the Prussian Government may have pre-

vented the learned author from conducting a volume of Hebrew syntax through the press, and we had it announced some years ago as nearly ready. So is my own third part, which it depends entirely on British and American scholars to receive in its time.

J. P. N. LAND.

LEFFLER'S PHYSIOLOGY OF CONSONANTS.

Rhyl : September 30, 1876.

I feel highly gratified to find that my short and imperfect sketch of Leffler's discussion of the stopped consonants has elicited two valuable contributions to our knowledge of the subject, the one from Mr. Ellis and the other from Mr. Sweet. To the former of these gentlemen I apologise most willingly for having referred to him as a "veteran" phonologist, and to the latter I am indebted for most valuable information as to the exact pronunciation of the consonants written double in Swedish: I was wrong, no doubt, as to the English equivalents which I ventured to suggest, but beyond that I cannot go. It is of no consequence how far I think Mr. Sweet's reasoning has damaged some of Dr. Leffler's theories, but I may suggest that the leading difference between them is not likely to be disposed of in a hurry. At any rate, the last German who has written on the subject comes to nearly the same conclusion as Dr. Leffler, and renders his *hard* and *soft* consonants into *fortis* and *lenis*, and that in spite of his knowing something of visible speech and palaeotype, and of glides and stops, for he professes to have made use of the first part of Mr. Ellis's great work on *Early English Pronunciation*; I allude to the *Indogermanische Grammatiken* (Leipzig, 1876), the first volume of which is devoted to phonology by Eduard Sievers.

JOHN RHYLS.

CATS IN ANCIENT GREECE.

Kilburn Priory : Sept. 30, 1876.

There is a well-known passage in Theocritus which is often referred to in connexion with this question, and which should not be altogether omitted in the present discussion.

It occurs in the fifteenth Idyll (ΣΥΡΑΚΟΥΣΙΑΙ) v. 28, where Praxinoa is telling her slave Eunoe to make haste and bring a towel (*vāma*). She says, "αὶ γαλέαυ μαλακῶς χρῆσθοντι καθεύδον." (We need not pause to enquire whether the words are used tauntingly to the slave to intimate that she is as lazy as a γαλέη, or whether the speaker means that the animals are snoozing on the towel.) The question is what are the γαλέαι. Harlesius in his note on the passage says "Γαλέη, proprie 'mustela.' De fele interpretari licet per ea quae disputavit Perizon ad Aelian. V. H., xiv. 4." On the other hand, Kiessling seems to have no doubt on the subject, and unhesitatingly renders the passage: "feles et molliter dormire cupiunt." It is also so given in the Latin prose Interpretatio, and the translation in verse by Raymundus Cunichius. (Parmæ, 1799—"cubare Nempetoro in molli feles vult.") So in English the word is rendered "cats" (Banks, prose; Chapman, verse: "cats would softly sleep").

Of course all this proves nothing, except that the translators did not take the trouble to enquire whether or no the cat was domesticated in Greece, or at least in Sicily, in the time of Theocritus.

I have not by me the edition of Aelian, *Var. Hist.*, to which Harlesius refers; so that I am unable to say what are the arguments by which it is sought to prove that γαλέη may be interpreted *felis*. The story told is of one Aristides who died of the bite of a γαλή; but that this animal could not have been a cat is, I think, proved by chap. xvii. of the same author's work *De Naturâ Animalium*, where he describes some of the habits of the αἰλουρος, which are unquestionably those of the cat. He clearly, therefore, uses the two words to describe different animals.

In the same way in the collection of fables which pass as Aesop's, there is the same distinction between the two animals (e.g., Fab. 27, αἰλουρος καὶ μύες; and Fab. 106, Νυκτερίς καὶ γαλή).

It may be remarked also that there are no words in Greek (or in Latin either) equivalent to our expressive words to *purr* and to *mew*, which can hardly be conceived to have been the case had the cat been a household animal in Hellas.

We may consider it therefore as distinctly proved—

- (1) That the marten (γαλή) and the cat (αἰλουρος) are distinct animals, and
- (2) That the former was domesticated among the Greeks.

And there is strong negative evidence that the latter was not so domesticated.

Against this there is one piece of apparently positive evidence, which would show that the cat was known as a domestic animal to the Greeks. On a coin of Tarentum there is represented a seated figure holding out a bird at which some feline animal is jumping. The coin is, I believe, extremely rare. There is a specimen in the British Museum, but the lower part of the animal is off the coin, and the authorities there call it "a panther's cub," but with a query added.† Of course, if it really is meant for a panther's cub the coin proves nothing. It would be classed among the numerous representations of mythical panthers which occur so frequently in ancient monuments, especially in the treatment of Bacchic subjects. But on a very fine specimen of the coin in the possession of Mr. Bunbury, where the animal is perfect, it appears to be an unmistakable cat.

T. J. ARNOLD.

Hanslope Park, Stony Stratford :
Sept. 28, 1876.

I am much obliged to Mr. Houghton for his instructive correction about the γαλή, and will have it inserted in the *Primer*. It is indeed gratifying to find so many able correspondents eager to correct one's mistakes. But, as to Mr. Murray, it seems to me that he ought to have seen that the passages I cited were not to prove that γαλή was a cat, but that the γαλή—the mouse-catching, thieving animal which did the duties of cat for the Greeks—was domesticated and common in Greek houses. This I understood to be the point of his original criticism, which did not raise the point about the name, but about the common occurrence of the beast. The German handbooks which speak of the cat in Greece as rare do not mention this substitute, so that it was worth showing that the Greeks had a domestic animal of the kind.

It seems to me that when I expressed doubts about the name, my intelligent critic should have seen that my quotations were not intended, and could not be intended by any sane man, to prove that the γαλή was a cat, but that the γαλή was common.

J. P. MAHAFFY.

[This controversy must now end.—Ed.]

JACOPO DE' BARBARJ AND PETER VISCHER.

Stanmore Hill : October 2, 1876.

I much regret that Mr. Burty should have been in any way ruffled by my last letter on this subject, and as it is not my intention to publish a work on my inkstands, nor on the elder Vischer, I cannot look for the honour, so obligingly offered me, of his revision.

Dr. Lübke has already and ably illustrated the former, together with the *Orpheus* plaques, and his large folio work on Peter Vischer will, doubtless, do full justice to such a theme. His weighty

* It is not mentioned by Sambon in his *Recherches sur les anciennes monnaies de l'Italie méridionale* (Naples: 1863. S. p. 115).

† *Catalogue of the Greek Coins in the British Museum*: Italy (1873, p. 171), where the coin is engraved.

* In a dead language we may omit some details of pronunciation, as we all omit quantity proper in Latin, marking only the accent, notwithstanding the great importance of the other.

weapon is not for my feeble *dilettanti* hands to play with, against the agile parry of M. Burty's professional foil; nor can I shift ground so deftly as he, although accused of such dexterity.

M. Ephrussi, to whom all honour is due for the valuable contents of his volume on Jacopo, is less severe, and, moreover, in his letter affords us interesting matter and suggestions on the subject of the Vischers; but these again are for Dr. Lübke to answer rather than for me. I would, however, remark that I did not apply the word "only" to the mistake of the emblems, but that I considered the belief in that discovery had magnified in importance any—as I still hold to be comparatively remote—similarity of character in the figures by Vischer and the etchings by Jacopo. And further, that the instand referred to as being dated 1525 has also incised upon it the emblem of the crossed angular hook (as mentioned by Dr. Lübke) in addition to the impaled fishes in relief. The other—to differ from M. Ephrussi, but as admitted by Dr. Lübke—is eminently Germanic in design and character.

I have established my point as regards Jacopo's reputed sculpture; it is now time, for me at least, to retire from this discussion. Helen-like, my poor "emblems of earthly life" have led to a protracted war, in which I, as Paris, am but a feeble combatant when Hector and Achilles are in the field.

To you all are indebted for the courteous permission to use your valuable columns as a tilting-ground.

C. DRURY E. FORTNUM.

Lessness Heath: October 2, 1876.

May I be permitted to point out to those who are interested in the discussion in the ACADEMY relating to Jacopo de' Barbari that the often quoted and misquoted passage in Dürer's letter with respect to him does not really imply, as it is always assumed to do, that Meister Jacob was at Venice when Dürer was there, or indeed, for that matter, that he was ever there at all? The passage, as given in Dr. Thausing's modern German rendering of Dürer's letters, runs as follows:—

"Und dasjenige was mir vor elf Jahren so wohl gefallen hat, das gefällt mir jetzt nicht mehr; und wenn ich's nicht selbst sähe, so hätte ich's Keinem geglaubt. Auch lasse ich Euch wissen, dass viele bessere Maler hier sind, als da draussen Meister Jacob ist, aber Anton Kolb schwüre einen Eid, es lebe kein bessere Maler auf Erden, als Jacob. Die Anderen spotten seiner; sie sagen, wäre er gut, so bliebe er hier," &c.

I had not the benefit of this modern German when I translated the letter in my *Life of Albrecht Dürer* in 1870, but it will be seen that my rendering from the old German text was almost literal.

"And that thing which pleased me so well eleven years ago, pleases me now no more. If I had not seen it myself, I could not have believed any one else. Also be it known to you that there are many better painters within this city (here) than Master Jacob without it, although Anthony Kolb swears that there is no better painter on earth than Jacob. The others laugh at this, and say, if he were good he would stay here."

It is strange that the significant words *da draussen*, meaning outside, or abroad from Venice, should have been overlooked by all critics, and an elaborate hypothesis built up on the strength of Dürer's supposed mention of Meister Jacob as being in Venice at this period, when in reality he expressly states the contrary. Even Mr. W. B. Scott writes in the ACADEMY of August 14: "From the letter just quoted we know he [that is, Jacopo de' Barbari] was in Venice part of the year at least." He entirely omits the words *da draussen*, in his rendering of the letter, and translates "wäre er gut so bliebe er hier" as, referring to Kolb, "but still he continues."

It is not, in fact, satisfactorily proved that the Meister Jacob of Dürer's letter was the same as Jacopo de' Barbari, in spite of all that has been written on the subject. In any case I cannot believe that the mysterious sentence, "That which pleased me so well eleven years ago pleases me now no more," refers to any work by Jacopo.

It seems plain in reading the text that Dürer, as was his wont, breaks into quite another subject when he begins "Auch lasse ich Euch wissen."

I would also suggest that the mistake Mr. Drury Fortnum corrects, of attributing the bronze relief of *Orpheus and Eurydice* to Jacopo de' Barbari, instead of to Peter Vischer, may not be so great as it at first appears. The style of this work far more closely resembles that of Jacopo de' Barbari than that of Albrecht Dürer, to whose *Adam and Eve* it is supposed to bear some relation. This similarity may possibly have arisen from Peter Vischer having copied the motive of some engraving or other design by Jacopo.

MARY M. HEATON.

JAMES HOWELL.

Fairwater, Taunton: Sept. 26, 1876.

In the notice of James Howell's book, *Some Sober Inspections*, in the ACADEMY of September 23, the reviewer describes the author as "a Caermarthenshire man." I had always been under the impression that Howell was a native of Breconshire, and that he was born at the small farmhouse called Cwnbryn, or more shortly Bryn, in the parish of Llangammarch, in that county. The only authority to which I can at present refer for confirmation is the Rev. Robert Williams's *Eminent Welshmen* (generally a very trustworthy guide), in which it is further stated that "James Howell was born in 1594," and that his father, Thomas Howell, was curate of the parish of Llangammarch "from 1576 to 1631, when he was presented to the living of Abernant and Cynvil Caio in Caermarthenshire."

T. POWELL.

AN ANGLO-JEWISH CATECHISM.

Leipzig: October 1, 1876.

Perceiving from your number of yesterday's date that my publisher has neglected to rectify the statement made in your previous number to the effect that the English Jews had hitherto been destitute of a Religious Catechism, I must, however reluctantly, come forward myself to say that, beside some other similar works, my own *Outlines of the Jewish Religion in a Series of Questions and Answers*, &c., have been before the Jewish public since 1842, when I first published them at Manchester, as Head Master of the Hebrews' Association School of that town. A second edition, published by P. Vallentine in London, appeared there in 1866. This catechism of mine is but a very small book, I grant, but, its exiguity notwithstanding, it answers its purpose as a *résumé* of the leading precepts of Judaism, and as such the present Chief Rabbi of Great Britain and Ireland permitted me, as his then private secretary, to send copies to the members of the Cabinet at the time when the Jewish Emancipation question was debated in the House of Commons.

D. ASHER.

THE following letter has been forwarded to us for publication, and is published with the consent of the author of the *History of the Fylde*:—

"In a correspondence with Colonel Fishwick, author of the *History of Kirkham*, I learn that the mention of his name and his work in my preface to the *History of the Fylde* is not considered by him a sufficient acknowledgment of my indebtedness to his previous labours in that town and parish; and, lest it should be thought that I am desirous of appropriating to myself any credit which is due to him as an earlier investigator, I take this opportunity of stating that, in addition to considerable personal research, I received most valuable aid from his interesting work in the compilation of my necessarily brief account of Kirkham. Believing his extracts from the records of the 'Thirty Men,' ancient 'Bailiffs' Court,' and other MSS. to be correct and authentic, I did not consider it requisite to go through those documents myself, but have inserted them as they are given in the *History of Kirkham*, the original authorities being quoted in footnotes similar to those of Colonel Fishwick's."

"JNO. PORTER."

SCIENCE.

RECENT ARABIC LITERATURE.

Les Colliers d'Or: Allocutions morales de Zamakhshari. Texte Arabe suivi d'une traduction française et d'un commentaire philologique: par C. Barbier de Meynard. *Les Pensées de Zamakhshari*. Texte Arabe publié complet pour la première fois, avec une traduction et des notes, par C. Barbier de Meynard. (Paris: Imprimerie Nationale.) There is a great similarity between these two works of Ez-Zamakhshari. Both are collections of pious maxims: but the maxims in the *Nawābiḡ el-Kelim* ("Les Pensées jaillissantes") are much shorter than those of the *Atwāk edh-Dhahab* ("Les Colliers d'Or"). In neither, however, is the thought of much consequence: the moral reflections may be very moral, but they certainly seem a little flat and uninteresting. The true value of both works, and especially of the first (*Les Colliers d'Or*), lies in the language. Ez-Zamakhshari is best known, not as a writer of religious meditations, but as a great grammarian, the author of the *Mufasssal* and the *Asās*, and a renowned interpreter of the Kurān. His writings have, therefore, always a great value for the student of the Arabic language quite independent of their matter; although in most cases (to which the present are perhaps exceptions) the matter is fully equal to the form. It is with a view chiefly to their philological importance that M. Barbier de Meynard has edited these two of the lesser works of Ez-Zamakhshari, and has enriched them with ample critical and explanatory notes. Both are edited for the first time; for the only edition of the *Colliers d'Or* before M. de Meynard's was Von Hammer's, which could hardly be reckoned an edition at all; and Schultens had published only a selection from the *Pensées* in his *Anthologia Sententiarum Arabicarum*. Of the scholarship of M. de Meynard's editions it is perhaps unnecessary to speak; but it may be mentioned that in the editing of the *Colliers* he has received the invaluable assistance of Prof. Fleischer. The translations, however, are chargeable with a fault very common in the work of French Orientalists: they are loose to an excessive degree. The gain in readableness does not compensate the loss in accuracy. The number of rare words and usages which are found explained in this collection is very great; and their explanations are made accessible to the grammarian and lexicographer by an excellent index. It were to be wished that a similar index had been added to the *Pensées*.

The Poetical Works of Behā-ed-din Zoheir of Egypt, with a Metrical English Translation, Notes, and Introduction, by E. H. Palmer, M.A., Lord Almoner's Reader and Professor of Arabic, and Fellow of St. John's College, Cambridge. Vol. I. Arabic Text. (Cambridge University Press.) We reserve a review of this work till the second and third volumes, containing the metrical translation and notes, shall appear. The present volume appears to have been carefully edited, notwithstanding a somewhat serious list of errata. It contains, besides the text of the poems, an Arabic preface by Mr. Palmer, written with his usual fluency, and exhibiting an uncommon command of the language. Not the least striking point about the volume is its external appearance. It is an *édition de luxe*, with an arabesque binding in excellent taste. The type, however, is objectionable; the vowel-points are not sufficiently distinct; and Mr. Palmer's ingenuity in obviating the printers' difficulty with certain letters has produced the most execrable final *hā* it has ever been our misfortune to see.

M. SAUVAIRE, in his *Histoire de Jérusalem et d'Hebron: Fragments de la Chronique de Moudjir-ed-dyn* (Paris: Leroux), has collected the principal passages relating to the topography and history of Jerusalem and Hebron in Mujir-ed-din's chronicle (*El-uns el-jelil bi-tarikh el-kuds wa-l-*

Khalil, written about 1500 A.D.), a work well known to students of the *Bibliothèque des Croisades*. M. Sauvaire's extracts open with the purchase of the cave of Machpelah by Abraham—a version of the Biblical narrative embellished in the true spirit of the Mohammedan historian. It appears that Ephron, wishing to compel Abraham to take the land as a gift, named as the price 400 pieces of silver, each struck with the impression of a different king. Abraham, aware of the difficulty of discovering 400 coin-striking monarchs at that period of the world's history, left the presence of the king in despair; but, as luck would have it, he met the angel Gabriel, who, in defiance of numismatics, produced the desired dirhems. With the first conquest of Jerusalem by the Crusaders in 1099 the narrative becomes more detailed. The history ends with the final capture of the Holy City by El-Melik Es-Sâlih in 1245. The second part of the volume is devoted to the topography of Jerusalem and Hebron, including a most interesting description of the *Mesjid el-aksa*; and a noteworthy account of the colleges (*medresehs*) of Jerusalem. The other features of the city are not left unnoticed, and short (too short!) sections are allotted to the neighbouring villages. The topographical part of the work ends with a description of Hebron and a section on the boundaries of the Holy Land. In the third part, which may be termed biographical, the author gives a list of the Memlûk sultans who governed Jerusalem from its final capture by Es-Sâlih to Mujir-ed-din's own time, with an account of the events which occurred at Jerusalem during their reign. This is followed by a valuable biographical list of the governors and other officers (*nâibs* and *nâdhirs*) at Jerusalem and Hebron. The volume closes with notes and an admirable index. M. Sauvaire addresses his readable and accurate translation to "the pilgrims and tourists of Palestine," and there can be no doubt that to this miscellaneous class of beings the volume will be most acceptable. It would be interesting to compare the Jerusalem of Mujir-ed-din with the Jerusalem of to-day, and the Mohammedan historian's description is quite minute enough for any such purpose as this. But the historical part of the work will be useful to others besides tourists and pilgrims. Although in some portions it is meagre, and although the period where it is fullest (that of the Crusades) is also the period about which most has been written, yet there is much that is important in this part of the volume. We must join with the Palestinian "pilgrims and tourists" in thanking M. Sauvaire for an interesting and useful addition to the library of works on the Holy Land—a library replete, for the most part, with useless and uninteresting books, to which the present volume presents a notable contrast.

La Vengeance d'Ali: Poème arabe. Traduit par Victor Largeau. Publié par les soins de Gustave Revilliod. (Paris: Sandoz et Fischbacher.) It seems that when M. Revilliod was staying at Algiers in 1844 he became acquainted with "certain Maures tenant par des liens de parenté aux meilleures familles du pays." Smitten with a great admiration for these men, he rendered them "certain légers services," in return for which he asked them to procure for him some of the poems which he heard constantly recited in the Arab *cafés*. On the day of his departure they brought him several MSS., among others that of *La Vengeance d'Ali*, which the Moors pointed out as one of the *chefs-d'œuvre* of their literature, an opinion which M. Revilliod in his preface supports by the most extravagant eulogies. For thirty years the poem remained unread, for M. Revilliod knew no Arabic and had not yet found a scholar to whom he could entrust the work of translation. But at last a happy destiny threw in his path a certain M. Victor Largeau, who had lived long in Algeria and was fully competent to translate the Algerine dialects. (To

these encomiums of M. Revilliod it should be added that M. Largeau's notes at the end of the volume display a most remarkable ignorance of the Arabic language.) The result of this fortunate conjunction of two such stars was the publication of *La Vengeance d'Ali*. The plot of the romance is simple. A young Arab named 'Ali, son of a great desert Shevkh, marries a beautiful girl, whom he worships with all the passion of Eastern love. One night 'Aisha is treacherously carried off by a rival chieftain, Amâr the Black, a redoubtable brigand. 'Ali gives himself up to despair, till he is roused by the reproaches of his friend Mesûd, and persuaded to devote his life to revenge. They go together in search of the ravisher, only to fall powerless into his hands. But while they are lying chained in the prison-house of Amâr the Black, they hear the song of the sweet voice they love counselling patience and hope. A servant, persuaded by 'Aisha, cuts their chains, and once more they are among their own tribe. They summon the clansmen together; the Beni-Mûsa and others assemble; they march against the black chieftain—and are cut in pieces. Once more 'Ali and Mesûd assemble their kindred; once more through deserts made terrible by thirst and heat and the dreaded simoom they march against their enemy. This time the vengeance is accomplished, Amâr conquered, enchained, killed, and 'Aisha restored to the arms of 'Ali. Such is the story. It comes from the lips of 'Ali throughout. The language is often beautiful, though, like that of most Oriental poems, a little tedious: full of fire and languor, of passion and despair; over-rich in descriptions and crowded with metaphors; but withal possessed of a certain fascination which it would be difficult to analyse. Yet of the genuineness of the poem we must confess to entertaining some suspicion. The Arabic manuscript has not been published, and there is nothing but the French translation to go upon. The style of the latter, though Oriental, is emphatically not Arab. It would be impossible to put *La Vengeance d'Ali* in the same class with the Arab romances of Abû-Zeyd, Delhemeh, etc. Whether the difference is owing to the influence of the Berbers, among whom the scene is laid, and of whom probably were the reciters of the poem; or to the unskilful handling of the translator; or, again, to the possible fact that the whole poem is an imposition—a theory which, however, we would not urge, except as a last necessity—it is difficult to decide. On any supposition of its origin, however, *La Vengeance d'Ali* is well worth reading.

DR. BARTH has just rendered an important service to Orientalists by editing Tha'lab's *Fasih*. Tha'lab was one of the great band of lexicographers and grammarians whose labours have preserved to us the pure classical Arabic in which Islâm was first preached. In the rapid rush of Mohammedan conquest there was every danger of admixture with other languages. The mischief, however, had scarcely begun before the danger was perceived. A numerous class of learned men had already been trained by the revision of the text of the *Kurân*—a step necessitated by the nature of the records of Mohammad's revelations—and these men at once devoted themselves not merely to establishing the purest text of the sacred book, but to preserving the language in which that book was written. The work they accomplished was far greater than they could have imagined. They cared only to preserve the language of Mohammad: but they did more than they knew; they handed down to us the purest form of Semitic speech and the richest storehouse of Semitic roots. Of the men who accomplished this great work, Tha'lab (A.H. 200-290) was among the most renowned. His work, short as it is, acquired an immense reputation, and was used by most of the great lexicographers who followed him. No less than twenty commentaries and five poetical versions of the *Fasih* were made; and it was described as the Bread of the Wise and the Twin-brother of the

classical language of the Arabs. The work is divided into two parts, the first dealing with the verb, the second with the noun; a few miscellaneous chapters being added at the end. Dr. Barth has done his part as editor well. His notes and introduction are valuable, and the text has been subjected to careful collation, the results of which are given at the foot of the page. Tha'lab's *Kitâb el-Fasih* is a great acquisition, and Orientalists owe Dr. Barth no little gratitude for his labour.

Les Arts Musulmans:—Les Peintres Arabes. Par M. H. Lavoix. (Paris: Joseph Baer et Cie.) However good Mohammad may have been as a prophet, he certainly was a Philistine. His antipathy to music and almost every branch of the fine arts was the most unreasonable part of his character. Fortunately, his commands, though generally obeyed in public, were not uncommonly set at naught in private. Wine and music, though the prophet visited both with his unqualified wrath, were in great request in the chambers of the Khalifs themselves; and, as for painting, it is said that the Khalif 'Abd-el-Melik, with the help of Byzantine artists, went so far as to decorate the doors of a splendid mosque he had built at Jerusalem with portraits of the Prophet himself; while the walls inside were covered with pictures representing Mohammad's Hell and its giant inhabitants disporting themselves in eternal fire, and the paradise of the faithful, with its gardens and flowers, and wine and houriis. Yet it would be a mistake to suppose that Mohammad's prohibition of figure-painting was without influence on the development of Muslim art. There can be no doubt that the heavy penalties which Mohammad declared were to be exacted in the next world from painters of things that have souls tended to throw discredit upon every branch of the art. Hence, although M. Lavoix has gathered together more instances of Arab painting than we thought possible, they form the exceptions and not the rule; just as the early Arab coins he shows us with the portrait of the Khalif upon them are the scanty exceptions to the seldom-violated rule of an imageless coinage. These exceptions, however, are often exceedingly interesting. The examples taken from the illustrated copy of El-Hariri are among the quaintest things that Eastern fantasy has ever produced: while some of the specimens of tapestry-work and the vases which M. Lavoix engraves possess no slight beauty. It is to be hoped that this first instalment of M. Lavoix's work will before long be followed by others on the various departments of *Les Arts Musulmans*. The present number only proves to our mind that the claim of the Arabs to the title of artists lies, not in their painting, but in their architecture, and still more in their mastery of the art of ornament, in which no nation has ever equalled them. STANLEY LANE POOLE.

SCIENCE NOTES.

IN the present number of *Mind*, J. A. Stewart pleads well for a more consistent following out of the traditions of English psychology which, in the hands of Locke, Berkeley, and Hume, was a method, "a certain thoughtful attitude in science, morals, and literature," and not a science. He admits that modern physiological psychology and comparative psychology (*Culturgeschichte*) yield valuable results though they cannot lay claim to be a science. James Ward has a searching criticism of Fechner's psycho-physical law, which, leaning upon an hypothesis of Prof. Bernstein and on researches of Prof. Dewar and Dr. M'Kendrick, he would regard as the expression of a purely physical relation, and not, as the author would have it, of a relation between a physical and a mental process. An article on Schopenhauer's philosophy, by Prof. Adamson of Owens College, though hardly as penetrative as one might wish, succeeds in vigorously exposing some of the most patent contradictions of the pessimist's system. The
